Poliziano. See **POLITIAN**.

Polk, JAMES KNOX, eleventh president of the United States, was born in Mecklenburg county, North Carolina, November 2, 1795. His ancestors, who bore the name of Pollock, emigrated from the north of Ireland; his father was a farmer in moderate circumstances. Polk was educated in the University of North Carolina, and studied law with Felix Grundy of Tennessee, an eminent lawyer and statesman. Admitted to the bar in 1820, he was three years after elected a member of the legislature of Tennessee, and in 1825 returned to congress by the Democratic party. In 1835 he was chosen speaker of the House of Representatives, a position he filled during five sessions with firmness and ability. After serving fourteen years in congress, he was in 1839 elected governor of Tennessee; but he failed to secure re-election in 1841 and 1843. In 1844 he was nominated as a compromise candidate for the presidency, against Henry Clay, and elected by a popular majority of only 38,000, but by 175 electoral votes to 105. His cabinet included James Buchanan as secretary of state and Bancroft, the historian, as secretary of the navy. Polk's firm attitude with regard to the annexation of Texas had mainly secured his election, and he carried out the policy to which he was committed with promptness and vigour. In his

first message to congress, in December 1845, he announced that the western bank of the Nueces River, beyond which Texas had not exercised jurisdiction, was already occupied by American troops. On 28th December Texas was admitted to the Union; on the 31st jurisdiction was extended to the disputed territory beyond the Nueces. These proceedings failing to goad the Mexicans into a declaration of war, the president forced on hostilities by advancing the American army, at the suggestion of General Taylor, to the Rio Grande. Palo Alto and Resaca followed, and the Mexican war was successfully started; the capital was taken in September, and its fall enabled the conquerors to dictate terms of peace, by which the United States acquired California and New Mexico. During Polk's term the Oregon boundary was settled by a compromise (49°) offered by England, though the party cry ('Fifty-four-forty or fight') which helped to elect him was a claim for the entire territory to 54° 40' N. lat. In 1846 a revenue tariff, in which *ad valorem* were substituted for specific and minimum duties, was adopted—in the senate, however, only by the casting vote of Vice-president Dallas. Polk consistently condemned the anti-slavery agitation; he did not believe in the possibility of a United States all slave or all free, and considered the *modus vivendi* between North and South quite satisfactory. Having pledged himself to a single term of office, he refused re-election, and retired to his home in Nashville, Tennessee, where he died 15th June 1849. Polk was devoted to the principles of the Democratic party of Jefferson and Jackson—state rights, a revenue tariff, independent treasury, and strict construction of the constitution—and taught an even intenser form of the Monroe doctrine.

See *Life* by Jenkins (1850); a History of his administration, by Chase (1850); and Whitelaw Reid on the Monroe doctrine and Polk's doctrine (1906).

Polk, LEONIDAS, the Antony Bop of the Confederacy, was born at Raleigh, North Carolina, 10th April 1806. He was a cousin of President Polk, and grandson of Colonel Thomas Polk, an officer of the Revolution. Graduating at West Point in 1827, he received a commission in the artillery, but was induced to study for the ministry, and in 1830 received deacon's and in 1831 priest's orders in the Episcopal Church. In 1838 he was consecrated Bishop of Arkansas and Indian Territory, with charge of the dioceses of Alabama, Mississippi, and Louisiana; in 1841 he resigned all these except the bishopric of Louisiana, which he retained—even when at the head of an army corps—until his death. Soon after the outbreak of the civil war he was offered a major-generalship by Jefferson Davis, and, accepting it, proceeded to strongly fortify strategical points on the Mississippi. At Belmont, in November 1861, he was driven from his camp by Grant, but returned and eventually compelled him to retire. At Shiloh and at Corinth he commanded the 1st corps; in October 1862 he was promoted to lieutenant-general, and in November he conducted the retreat from Kentucky. After Chickamauga, where he commanded the right wing, he was relieved of his command; but in December 1863 he was appointed to the department of Alabama, Mississippi, and Eastern Louisiana, and he afterwards joined Johnston in opposing Sherman's march to Atlanta. He was killed while reconnoitring on Pine Mountain, 14th June 1864, by a cannon-shot fired by some Northern officers who wished to give the bishop's party a fright. See the *Life* by W. M. Polk (1894).

Polka, a species of dance, of Bohemian origin, invented in 1830, and introduced into England in 1843, the music to which is in $\frac{2}{4}$ time, and has the

rhythmical peculiarity of being accented on the third quaver of the measure.

Pollack (*Gadus pollackius*), a common fish on British coasts, belonging to the cod, haddock, and whiting genus. It is about the size of the coal-fish, is active in habit, and is frequently caught. The lower jaw projects beyond the upper, and there is no barbel. In Scotland and in some parts of England and Ireland it is called *Lythe*.

Pollaiuolo, ANTONIO, goldsmith, medallist, metal-caster, and painter, was born at Florence in 1429, and died at Rome in 1498, whither he had been summoned to cast a sepulchral monument for Pope Sixtus IV., and where he also cast a similar one for Pope Innocent VIII. (died 1492), both in St Peter's, and both works of great merit. Antonio's pictures—the best being 'Hercules slaying the Hydra,' 'Hercules destroying Antaeus,' and 'St Sebastian'—are distinguished for the life and vigour of their drawing.—His brother PIETRO, who was born at Florence in 1443, and died at Rome in 1496, was generally associated with him in his work, though he devoted most attention to painting. To him are attributed an altarpiece introducing SS. James, Vincent, and Eustace (if indeed it is not mainly by the other brother), an Annunciation, a Coronation of the Virgin, and the Five Virtues.

Pollan (*Coregonus pollan*), a species of 'white-fish' peculiar to Lough Neagh in Ireland, where it feeds largely on an interesting crustacean called *Mysis relicta*, the relatives of which are marine. It is netted in considerable numbers and is well flavoured. Another pollan (*C. altior*) is found in Lough Erne, and another (*C. elegans*) in the lakes of the Shannon system. See C. Tate Regan, *British Freshwater Fishes* (London, 1911); also COREGONUS, POWAN, VENDACK.

Pollanarrua, a ruined city of Ceylon, 60 miles E.N.E. of Kandy, with a massive dagoba, a rock-cut temple, masses of sculptured stones, and a wide area of ruined buildings that attest the size and importance of the city, which became the capital of the kingdom about 770, after the Malabar invasion ruined Anuradhapura, the former capital. The city stood on the site of an immense tank, still called Topawewa or Topare. The place was first made known to Europeans in 1820.

Pollarding (*to poll*, to cut off, or shave the head) is the cutting off of the whole crown of a tree, leaving it to send out new branches from the top of the stem. Trees thus treated are called *pollards*. The new branches are never equal in magnitude to the original branches of the tree, although often more numerous, and when pollarding is often repeated the scars and stumps form a thick ring at the top of the stem, from which many small branches spring. Pollards are not beautiful; but pollarding is practised with advantage in districts where fuel is scarce, the branches being cut off in order to be used for fuel, and the operation repeated every third or fourth year. Willows, poplars, alders, elms, oaks, and limes are the trees most frequently pollarded, and in some parts of Europe the white mulberry. The trees of most rapid growth are preferred where fuel is the object; and willows, poplars, and alders are planted along water-courses, and in rows in moist meadows and bogs. Oaks are sometimes pollarded, chiefly for the sake of the bark of their branches, and the whole treatment very much resembles that of copse-wood. See COPSE.

Pollen. See FLOWER, STAMEN.

Pollio, GAIUS ASINIUS, an orator, poet, historian, and soldier, was born in Rome, 76 B.C. He sided with Cæsar in the civil war, fought at Pharsalia, and commanded in Spain against Sextus

Pompeius, but was defeated. He sided with the triumvirs against the oligarchic senate, and was appointed by Antony to settle the veterans on the lands assigned them in Transpadane Gaul. It was now that he saved the property of the poet Virgil at Mantua from confiscation. After Antony and Octavian had quarrelled, it was Pollio who effected their temporary reconciliation at Brundisium (40). This year he was consul, when Virgil's fourth eclogue was addressed to him. The year after, he went to Greece as legate of Antony, and defeated the Parthini, a people of Illyria. This was the period of Virgil's eighth eclogue, also addressed to Pollio. Thereafter he withdrew altogether from political life, and survived till 4 A.D. Pollio was the first to establish a public library at Rome, and was the patron of Virgil, Horace, and other poets. His own orations and tragedies and history have perished, and it is most probably no great loss. The severest critics are seldom themselves even decent writers, and he, we are told, detected *Potivaintas* in the limpid style of Livy, and censured Cicero, Sallust, and Cæsar.

Pollock, an illustrious family descended from David Pollock, saddler to George III. in the later part of the 18th century, who kept a shop near Charing Cross. Three of his sons rose to eminence—Sir David Pollock (1780-1847), Chief-justice of Bombay; Sir Frederick Pollock; and Field-marshal Sir George Pollock.—The second, FREDERICK, was born 23d September 1783, and in 1802 passed from St Paul's School to Trinity College, Cambridge, where in 1806 he graduated B.A. as senior wrangler and first Smith's prizeman. Next year he was elected a fellow of his college, and called to the bar at the Middle Temple. He travelled the northern circuit; in 1827 became a K.C.; in 1831 was returned as a Tory for Huntingdon; was Attorney-general 1834-35 and 1841-44; and in the last year succeeded Lord Abinger as Chief Baron of the Exchequer. He had been knighted in 1834, and on his retirement in 1866 he received a baronetcy. He died 23d August 1870.—His eldest son, SIR FREDERICK POLLOCK, born 3d April 1815, was educated at Trinity College, Cambridge (1832-36), and in 1838 was called to the bar at the Inner Temple. He was appointed a master of the Court of Exchequer (1846), and Queen's Remembrancer (1874); in 1876 became senior master of the Supreme Court of Judicature; in 1886 resigned his offices; and died 24th December 1888. He published a blank verse translation of Dante (1854), and two pleasant volumes of *Personal Remembrances* (1887).—His eldest son, SIR FREDERICK POLLOCK, P.C. (1911), third baronet, was born 10th December 1845, and from Eton passed to Trinity, where in 1868 he obtained a fellowship. He was called to the bar at Lincoln's Inn in 1871, and became professor of Jurisprudence at University College, London (1882), Corpus professor of Jurisprudence at Oxford (1883-1903), and professor of Common Law (1884). Besides *Spinoza* (1880), he has published books on *Contract* (1875), *Partnership* (1877), *Torts* (1887), *Oxford Lectures* (1891); with Maitland, *The History of English Law before Edward I.* (2 vols. 1895), and with Mrs Fuller Maitland *The Etchingham Letters* (1899).—His younger brother, WALTER HERRIES POLLOCK, born in 1850, and likewise educated at Eton and Trinity, was called to the bar at the Inner Temple in 1874, and from 1884 till 1894 was editor of the *Saturday Review*. He was author of *Lectures on French Poets, The Picture's Secret, Verses of Two Tongues, A Nine Men's Morrice, Old and New, &c.* He died on his 76th birthday, 21st February 1926.—GEORGE FREDERICK POLLOCK (1821-1915), third son of the first baronet, became a master of the Supreme Court of Judica-

ture; and the fourth son, SIR CHARLES EDWARD (1823-97), became a baron of Exchequer and judge of the High Court.

SIR GEORGE POLLOCK, field-marshal, was born in Westminster on 4th June 1786, and entered the army of the East India Company as lieutenant of artillery in 1803. Almost immediately after his arrival in India he was engaged in active warfare in the battle and siege of Deig in Bhartpur (1804), at the siege of Bhartpur (1805), and in other operations in the war against Holkar. Nine years later he saw some service in the Nepal (Gurkha) campaigns of 1814-16; and in the first Burmese war (1824-26) he took an active share, winning his colonelcy. In 1838 he reached the rank of major-general. After the massacre of General Elphinstone and his forces in the passes of Afghanistan (q.v.), the Indian government decided to send a force to the relief of Sir Robert Sale, who was shut up in Jellalabad. The command of the relieving force was given to General Pollock. In April 1842 (5th to 16th) he forced the formidable Khimbar Pass, and reached Sir Robert Sale; then, after a few months' delay, he pushed on to Kabul, his object being to restore the prestige of British arms and to rescue the British prisoners in the hands of Akbar Khan. Both purposes were crowned with success; he defeated the Afghan chief at Tezin, and destroyed the bazaar in Kabul, and he recovered 135 British prisoners. Then, joined by Nott, who had marched from Kandahar, he successfully conducted the united armies back to India. He was rewarded with a political appointment at Lucknow, returned to England in 1846, was a director of the East India Company (1854-56), was created a field-marshal in 1870, a baronet in 1872; in 1871 he was appointed Constable of the Tower. He died on 6th October 1872. See *Life* by C. R. Low (1873).

Pollok, ROBERT, a minor Scottish poet, was born in 1799 at Muirhouse, in the parish of Eaglesham, Renfrewshire. He studied at the university of Glasgow and the Divinity Hall of the Secession Church, and was licensed to preach in 1827. In the same year he published, by the advice of Professor Wilson, *The Course of Time*, in ten books, an attempt at a poetical description of the spiritual life and destiny of man. It was warmly received, but its praises fell on a dying ear, for the poet had meantime been seized with consumption. He set out with his sister for Italy, but unable to leave England, he died at Shirley Common, near Southampton, 18th September 1827. *The Course of Time* is curiously unequal in merit as we might expect when we remember that its two sources of inspiration were Milton and the *Shorter Catechism*. It contains eloquent passages, but portions of it read like a dull sermon in poor blank verse. Pollok published *Tales of the Covenanters* anonymously before his poem. See the memoir by his brother (1843); Rosaline Masson, *Pollok and Aytoun* ('Famous Scots,' 1899).

Pollockshaws, in Renfrewshire, was incorporated with Glasgow in 1912. It derives its name from the 'shaws' or woods of the estate of Pollok, held for more than six centuries by the Maxwells.

Poll-tax, or **CAPITATION TAX**, a tax levied by the *poll* or head (*per capita*). In England, the first poll-tax was levied in 1377 at 4d. a head. In the reign of Richard II., the two poll-taxes, graduated according to rank and wealth (one varying from 4d. to £6, 13s. 4d.), helped largely to bring about the Peasant Revolt of 1381. Subsequently, this form of taxation was sometimes used to obtain revenue from aliens who escaped the ordinary dues, but a general poll-tax in 1513 took wages as one of the measures of capability. Graduated poll-taxes

were imposed during the reign of Charles II., and also after the Revolution for the war with France, but not after 1698. They were always extremely unpopular, and, owing to the difficulties of assessment and collection, never produced anything like the amount reasonably expected. In the United States most states impose a poll-tax or capitation tax as a condition of the suffrage, the sum varying. A considerable number have no such tax; in others the imposition of a poll-tax is expressly prohibited by the constitution.

Pollux. See CASTOR AND POLLUX.

Polo, an equestrian game, which may be shortly described as hockey on horseback. It is of oriental origin and of high antiquity; indeed, it has been claimed that it can be traced back to 600 B.C. The accompanying illustration is from a beautifully illuminated Persian MS. of the poems of Hafiz, executed in the year 956 of the Hegira or 1549 of the Christian era, and now in the Bodleian Library, Oxford, by the permission of whose

authorities it has been specially photographed to illustrate this article. It bears the following legend: 'Welcome to the *meutia*, thou chief of horsemen: strike the ball.' Polo was first played by Europeans in 1863 in Calcutta, whither it had been brought by officers who had been stationed in Cachar in Assam, where polo has been played since time immemorial by the hill-tribe of Manipuris. Almost the same game exists in Tibet; whilst native equestrian games more or less closely resembling polo are played in Japan and other parts of the East. Since 1871 many polo clubs have been started in Britain and, since 1876, in America, as well as wherever Britons are found in the East. The principal British club, which makes the rules of the game, is at Hurlingham, near London. The following is a short description of polo: An oblong space of turf is marked out, of which the proper size is 300 yards by 200 yards; at each end in the centre of the line two poles are fixed 22 feet apart, forming the goals through which it is the object of the opposing sides to strike the ball. The players are mounted on ponies, the size of which, according to rule, should not exceed 14 hands; and each player is armed with a polo-stick, consisting of a strong cane about 4 feet long with a cross head about 8 inches long, with which to strike the ball of

light wood. The proper number of players is four a side, each of whom has a definite place (numbered one, two, three, and back) in relation to friends and opponents; and in polo, as in most games, combination is perhaps the first condition of success. The ponies have to be carefully trained, and some acquire wonderful cleverness in understanding what is required of them. It is part of the game so to ride alongside an opponent as to prevent him from hitting the ball, but it is not allowed to ride across in front of an opponent. To become a good player requires strength, good horsemanship, a quick eye, and much practice.

See Younghusband's *Polo in India* (1890); the chapter on Polo by J. Moray Brown in *Riding* (1891); and books by Miller (1902) and Dale (1905).

POLO. MARCO, the greatest of mediæval travellers, was born of a noble family of Dalmatian origin, at Venice, in 1254. His father, Nicolo Polo, and his uncle, Maffeo Polo, both enterprising merchants, had, previous to his birth, set out on a mercantile expedition, visiting Constantinople, the Crimea, and the court of Barka Khan at Sarai. Thence they travelled round the north side of the Caspian Sea to Bokhara, and here they fell in with some envoys returning from Hulagu in Persia to his brother the Great Khan Kublai, and by them were persuaded to accompany them to Cathay. They were well received by Kublai, then either at Cambaluc (Peking) or his summer residence at Shangtu (Coleridge's *Xanadu*), north of the Great Wall. He listened eagerly to their reports concerning the peoples and mode of government in Europe, and commissioned them as envoys to the pope, bearing letters requesting him to send 100 Europeans learned in the sciences and arts, to act as instructors to the Mongols. They reached Venice in 1269, found Rome in the confusion of a long interregnum, and, after the new pope (Gregory X.) was elected, could only get two Dominicans, and even these had hardly commenced the journey when they lost heart and turned back. The Polos made their final start in the November of 1271, taking with them young Marco, and arrived again at the court of Kublai Khan in the spring of 1275, after travelling by Sivas, Mosul, Bagdad, Hormuz, through Khorasan, up the Oxus to the Pamir, by Kasghar, Yarkand, and Khotan, Lob Nor, and across the great desert of Gobi to Tangut, thence to Shangtu. Their second reception was still more honourable than the first, and the khan took special notice of Marco, from the rapidity with which he learned the customs and language of the Mongols. His wisdom and intelligence also recommended him as a fit envoy to the various neighbouring rulers; and during his residence at their several courts Marco observed closely the manners and customs of the country, and delivered on his return a detailed report to the khan. In various missions he visited the western provinces on the borders of Tibet, Yunnan, northern Burma (Mien), Karakorum, Champa or southern Cochinchina, and Southern India. For three years he served as governor of the town of Yangchow, and with his uncle helped to reduce the city of Suifu by constructing mangonels for casting stones. The khan long refused to think of the Polos leaving his court, but at length in the beginning of 1292 they succeeded in obtaining permission to join the escort of a Mongol princess, who was travelling to marry Arghun, khan of Persia, grandson of Kublai's brother Hulagu. They sailed from Chwanchow in Fokien (*Zaiton*), but were detained long on the coasts of Sumatra and Southern India, and only reached Persia after two years had passed. Two of the three envoys and most of their attendants had perished, Arghun Khan himself was dead, but the three Polos and the young princess were

safe, and she married the late khan's brother and successor. The Venetians finally reached their native city about the end of 1295, and Ramusio tells the story how like Ulysses they were recognised by none of their kinsfolk, and repulsed from the door. They brought with them much wealth in the portable form of precious stones, the fruits of their trading. In 1298 Marco fought his own galley in the great battle of Curzola, in which the Venetians under Dandolo were defeated by the Genoese under Doria, and was taken prisoner and immured for a year in a dungeon at Genoa. Here he dictated to another captive, one Rusticiano of Pisa, an account of his journey through the East. After his liberation he returned to Venice, where he died in 1324, and was buried in the church of S. Lorenzo. The traveller bore among his contemporaries the surname or nickname of Marco *Milioni*, most probably from his having frequently used that word in his attempts to describe the wealth and splendour of the khan. The wonders he narrated seem to have excited incredulity—even long after Sir Thomas Browne commends the circumspection of the reader who 'shall carry a wary eye on *Paulus Venetus*, *Jovius*, *Olaus Magnus*, *Nierembergius*, and many others.'

Marco Polo's book consists of two parts: (1) a Prologue, the only part containing personal narrative; (2) a long series of chapters descriptive of notable sights, manners of different states of Asia, especially that of Kublai Khan; and ends with a dull chronicle of the internecine wars of the House of Genghis during the second half of the 13th century. Ser Marco Polo succeeds in almost entirely effacing himself, yet despite his modesty is unconsciously revealed to the eyes of his reader as a man truthful, brave, shrewd, keen-eyed, grave, of few words, fond of sport, with all the due respect of the prosperous man for wealth. He shows throughout a singular lack of humour. Sir Henry Yule cites as almost the solitary instance that in speaking of the khan's paper-money he observes that Kublai might be said to have the true Philosopher's Stone, for he made his money at pleasure out of the bark of trees. Nothing disturbs the even tenor of his narrative—not even when he has to tell of so strange a custom as the convade among the Gold teeth on the frontier of Burma. He is no less sparing of scientific observations, and his geographical data are not infrequently the reverse of clear and adequate. He tells us that he acquired several of the languages current in the Mongol empire, and as many as four written characters, but of these Sir Henry Yule thought Chinese was not one. His work is poorer in information relating to the Chinese proper than anywhere else. Thus, he does not mention the Great Wall, nor yet customs so striking and distinctive as the use of tea, the compressed feet of the ladies, the fishing cormorant, artificial egg hatching, nor the printing of books. An absurd assertion has been made that block-printing was carried to Europe by our traveller, by him shown to one Panfilo Castaldi, from whom it was learned by John Faust of Mainz; and indeed the printers of Lombardy, misled by patriotic feelings, have stultified themselves by erecting a statue at Feltré to Castaldi, 'the illustrious inventor of movable printing types.' Polo had learned more from men than books, yet it is evident that he had read romances, especially those dealing with the fabulous adventures of Alexander. To these he refers in his notices of the Iron Gate and of Gog and Magog, and of the Div Tree (*Arbre Sol* or *Arbre Sec*) on the Khorasan frontier. Such stories as these, that of the Land of Darkness, of tailed men, of the great Roc, of trees yielding wine, and the like, go far to account for the grave and

matter-of-fact Messer Marco Polo's nickname of *Millioni*.

Ramusio (1485-1557) assumed that the book was first written in Latin; Marsden supposed in the Venetian dialect; Baldelli-Boni showed in his edition (Flor. 1827) that it was French. There exists an old French text, published by the Paris Société de Géographie in 1824, which M. Paulin Paris describes as the French of a foreigner. This Colonel Yule believed the nearest possible approach to Marco's own oral narrative. About eighty MSS. are in existence, showing considerable variations. These fall naturally into four groups: (1) the old French version already mentioned; (2) a revised French version, the basis of M. Pauthier's edition (1865); (3) a considerably abridged Latin version by Francesco Pipino (about 1490)—not identical with, although similar to, the Latin version published by Grynaeus at Basel in the *Norus Orbis* (1532), itself the parent of the 16th-century French editions; (4) a form of the text now alone represented by the Italian recension of Ramusio, published (1559) in vol. ii. of the *Navigazioni e Viaggi*. This last text has been subjected to considerable literary modifications, but undoubtedly contains many new circumstances which are substantially supplementary recollections of Marco Polo himself.

The notes of Marsden's excellent English edition (1818) were abridged by T. Wright for Bohn's 'Antiquarian Library' (1854). Another good English edition is that of Hugh Murray (1844); but all its predecessors were set aside by the admirable edition of Colonel Sir Henry Yule (1871; new ed. 1903), containing a faithful English translation from an eclectic text, an exhaustive introduction, notes, and other illustrations from the editor's wide learning and intimate knowledge of the East. French or Italian editions worthy of mention are those of the Soc. de Géog. de Paris (1824), Baldelli-Boni (1827), Lazari (1847), Bartoli (1863), and Pauthier (1865). Sir Francis Palgrave's *Merchant and Friar* (1837) is of course a mere work of imagination, in which Roger Bacon and Marco Polo are brought together.

Polonaise, or POLACCA, a Polish national dance of slow movement in 2 time.

Polyandry. See FAMILY, MARRIAGE.

Polyanthus (Gr., 'many-flowered'), a kind of Primula, much prized and cultivated by florists. It

Polyanthus.

is believed to be derived from a hybrid between the Primrose (q.v.) and the Cowslip (q.v.), and like the latter has an umbel of numerous flowers

supported on a common scape, instead of each flower rising on its own stalk from the crown of the root as in the primrose. Instead of the pale uniformity of the wild plants it exhibits great variety of delicate and beautiful colours. The subvarieties are innumerable, new ones being continually produced from seed, and of short duration. The seed is sown about midsummer, and flowers may be expected in abundance next year, if the young plants are properly planted out. A rich free soil is most suitable. The polyanthus loves shade and moisture more than its congener, the auricula. It is very hardy, and seldom suffers from the most severe winters. Fine kinds are preserved for a time by dividing the root. The cultivation of the polyanthus is prosecuted with particular assiduity and success in England. For the Polyanthus Narcissus, see NARCISSUS.

Polybius, the Greek historian, was born about 204 B.C. at Megalopolis in Arcadia. From his father Lycortas, one of the leading men of the Achaean League, he received valuable instruction in the science of politics and in the art of war. He was one of the 1000 noble Achaeans who, after the conquest of Macedonia in 168, were sent to Rome on the ground that the Achaeans had failed to assist the Romans against Persens. Without any trial the Greeks were detained in an honourable captivity. Polybius was the guest of Æmilius Paulus himself, and became the close friend of his son, Scipio Æmilianus, accompanying him in his military expeditions. Polybius in his turn derived much advantage from the protection and friendship of Scipio, who gave him access to public documents, and aided him in the collection of materials for his great historical work. In 151, after sixteen years in Italy, the surviving Achaean exiles were permitted by the Roman senate to return to Greece; Polybius, however, soon rejoined Scipio, followed him in his African campaign, and was present at the destruction of Carthage in 146. But the outbreak of war between the Achaeans and Romans summoned him again to Greece, where he arrived soon after the taking of Corinth. All his influence was now exerted to procure from the conquerors favourable terms for the vanquished; and so grateful were his countrymen for his services in their behalf that they erected statues in his honour at Megalopolis and elsewhere. It must have been about this time that Polybius undertook the writing of his great historical work, the materials of which he had so long been collecting; and in furtherance of his plan he undertook several long journeys—to Asia Minor, Egypt, Upper Italy, southern France, and even Spain—where it has been supposed he witnessed the capture of Numantia by Scipio in 133. He died about 122 B.C.

His history, the design of which was to show how and why it was that all the civilised countries of the world fell under the dominion of Rome, includes the period between 220, where the history of Aratus concluded, and 146 B.C., the year when Corinth fell, and with it the independence of Greece. Much the greater part of the work has perished. Of forty books only the first five are preserved complete; but the plan of the whole work is fully known. Of the two parts into which it was divided the first (books iii.-xxx.; the introductory books i. and ii. being a sketch of the earlier history of Rome) embraced a period of fifty-three years, commencing with the second Punic War and the Social War in Greece, and concluding with the subjugation of the kingdom of Macedonia in 168. The last ten books deal with the years 168-146. The great merits of Polybius are the care with which he collected his materials, his strong love of truth, his breadth of view, and his sound judgment, which was materially assisted by his

familiarity with political and military life. He was an excellent authority on the art of war. His tone is didactic, dull, and wearisome; he is too anxious to draw consequences and deduce lessons, and has been called 'the first pragmatical historian'. His method of exposition is careless, somewhat confused, and inartistic; his style, occasionally pithy, but usually bald to a degree, belongs to the period of beginning decadence.

Of the thirty-five books which have not been preserved entire we possess merely fragments or extracts. Fragments were found by Cardinal Mai, and published as late as 1827. Valuable editions have been published by Schwobhauser (1789-95; new ed. Oxford, 1831), Bekker (1844), Dindorf (1862-68, new ed. 1882), Hultsch (1868-72; 2d ed. 1888). The portion on the history of the Achaean league has been edited by W. W. Capes, and selections (based on Hultsch) by Strachan Davidson (1888); there is a readable English translation by E. S. Shuckburgh (1889) and one by W. R. Paton (with text, 1923). See Mahaffy, *The Greek World under Roman Rule* (1890); German works on Polybius by La Roche (1857), Pichler (1860), Seala (1891) and Cuntz (*Polybius und sein Werk*, 1902).

Polycarp, one of the 'Apostolic Fathers,' was bishop at Smyrna in proconsular Asia during the earlier half of the 2d century. His is an important name, for he bridges the little known and much controverted period lying between the age of his master the Apostle John and that of his own disciple Irenaeus, and his testimony is only the larger, clearer, and more valuable because of his rigid conservatism and lack of intellectual individuality. The 'Life' by 'Pionius' is utterly untrustworthy. All that is really known of Polycarp's origin is gathered from his dying declaration, which shows that he was born about 69 A.D., and probably of Christian parents. By the migration of apostles and others from doomed Jerusalem, Ephesus and the neighbouring districts became the new home of the faith, and there Polycarp was 'taught by Apostles,' John above all, and 'lived in familiar intercourse with many that had seen Christ' (Irenaeus, *Heresies*, iii. 3, 4). The further statement that he was appointed bishop in Smyrna 'by Apostles' ('by John'-Tertullian) is probably coloured by the later conception of the episcopate, but he certainly appears to have been head of the church from early manhood.

Among contemporaries he was intimate with Papias. More interesting is his brief intercourse with Ignatius, who, on his way from Antioch to martyrdom at Rome, made a short stay at Smyrna, where Polycarp and the church ministered to him. The tone of his *Epistle to Polycarp*, written shortly after from Troas, is that of a letter to one less experienced, is not younger, and less energetic than the writer, but high respect is paid to Polycarp's steadfastness, piety, and position. In consequence of a request which Ignatius was making to the churches to send messages to Antioch, the Philippians wrote to Polycarp asking that their letter to Antioch might be forwarded by the Smyrnaean messenger, at the same time inviting exhortation, and further asking for any of the epistles of Ignatius that he might have. Hence Polycarp's *Epistle to the Philippians*, in which he accedes to their various requests, and solicits further news of Ignatius. His influence on a younger generation, and his importance as a faithful preserver of the apostolic tradition, are vividly delineated by his greatest disciple Irenaeus in his *Epistle to Florinus*, quoted in Eusebius, *Hist. Eccl.* v. 20: 'I can tell the very place where the blessed Polycarp used to sit and discourse. . . . Whatever things he had heard from them (John and others) about the Lord . . . Polycarp, as having received them from eye-witnesses of the life of the Word, would relate altogether in accordance with

the Scriptures. These valuable reminiscences relate to a period somewhere between 135 and 150 A.D.

At the very close of his life Polycarp visited Rome, where he conferred with the bishop Anicetus, chiefly on the vexed question of the time for commemorating the Passion. On this point neither yielded to the other, yet their relations remained so cordial that Anicetus allowed Polycarp to take his place in celebrating the eucharist (see Irenaeus quoted in Eusebius, *Hist. Eccl.* v. 24). After turning many Valentinians and Marcionites from their heresies by his preaching, the aged bishop returned to Smyrna, only to win the martyr's crown in a persecution which broke out during a great festival. Unsatiated with meager victims, the mob called for Polycarp, 'the father of the Christians.' With truest dignity and modesty does Polycarp play the man. Betrayed by his servant-boy, but offered his life by the proconsul if he will revile Christ, he answers: 'Fourscore and six years have I been His servant, and He hath done me no wrong. How then can I blaspheme my King, who hath saved me?' As the games were over, death by fire was substituted for death by wild beasts, and Jews vied with heathens in providing fuel. But the fire arched itself about the martyr, and he had to be despatched with a dagger. The graphic *Letter of the Smyrnaeans* tells the story of the martyrdom to the Philomelan church. A chronological appendix to this letter has been elucidated by Waddington's skillful dating of the 'proconsul,' and his conclusions have been confirmed by the discovery of inscriptions relating to the 'high-priest,' also mentioned therein, so that the martyrdom may, with strong probability, be dated 23d February 155 A.D.

The only writing of Polycarp extant is the *Epistle to the Philippians*, incomplete in the original Greek, but complete in a Latin translation. Its genuineness has been assailed, but unaccessfully. Somewhat commonplace in itself, it is of great value for questions of the canon, the origin of the church, and the Ignatian Epistles. More New Testament phrases are here unweaved than are found in any other work of the time. Their wider range, and especially the prominence given to Paul and his epistles by this disciple of John, tell heavily against Tubingen theories of the origin of the church and the canon. The letter wears so closely on the Ignatian Epistles that, while apart from it the external evidence for their genuineness is weak, with it that evidence is very strong. The grounds, however, for assigning the epistles of Ignatius and Polycarp to the reign of Trajan are not beyond question, while among other things a certain inference to heresy in Polycarp's epistle would better accord with a time about 130 A.D., or even later.

For one of the best editions of the *Epistle* (first edited by Halloix in 1633 and frequently since), see *Patrum Apostolorum Opera* (ed. Gebhardt, &c., vol. ii, 1876); for the date of the martyrdom, Waddington's *Fastes des Provinces Asiatiques* (Paris, 1872), and the Oxford *Indica Biblica* (1885 and 1890). But the best and most exhaustive work on all the parts of the subject is Lightfoot's *Apostolic Fathers*, part ii. (2d ed. 1889). An ingenious, scholarly, and able attempt is made by the Rev. J. M. Cotterill in the *Cambridge Journal of Philology* (1891) to attribute the extant epistle to Ptochus, a monk of St Saba, who flourished under Heraclius, and from whose pen is still extant, 'if, in ribbon's phrase, "what no one reads may be said to be extant," a dull and feeble work entitled *Πανόδετος* or *ἄγλιος γράφας*, divided into 130 homilies.

Polycharta. See CHETOPODS.

Polycotyledonous Plants are those whose embryos have more than two seed-leaves (cotyledons). Examples are found occasionally (regu-

larly in *Acer Pseudo-Platanus*), or as monstrosities, among Dicotyledons. In the Pine group of the Conifere (q.v.) the polycotyledonous condition is the normal one, and the cotyledons occur in whorls of from three to eighteen. Multiplication of cotyledons occurs in a few other groups of the Conifere. Sometimes the numerous cotyledons unite in pairs, and this leads to the suggestion that they originally sprang from two; but many botanists believe that the cotyledons arise as separate leaves.

Polyrates, 'tyrant' of Samos from about 536 B.C. to 522. He conquered several islands of the Archipelago, and even some towns on the Asiatic mainland, waged war successfully against the inhabitants of Miletus, and defeated their allies, the Lesbians, in a great sea-fight. His intimate alliance with Amasis, king of Egypt, proves the importance in which this daring island-prince was held even by great monarchs. According to Herodotus, Amasis dreaded the misfortunes that the envious gods must be preparing for so lucky a mortal, and wrote a letter to Polyrates, earnestly advising him to throw away the possession that he deemed most valuable, and thereby avert the stroke of the splendid gods. Polyrates, in compliance with this friendly advice, cast a signet-ring of marvellously beautiful workmanship into the sea, but next day a fisherman presented the tyrant with an unusually big fish that he had caught, and in its belly was found the identical ring. It was quite clear to Amasis now that Polyrates was a doomed man, and he immediately broke off the alliance. When Cambyses invaded Egypt (525) Polyrates sent him a contingent of forty ships, in which he placed all the Samians disaffected towards his tyranny, hoping they might never come back; but mutinying they returned to Samos, and made war against the tyrant, but without success. Hereupon they went to Sparta, and succeeded in securing the help of both Spartans and Corinthians. A triple force of Samians, Spartans, and Corinthians embarked for Samos, and besieged Samos in vain, and Polyrates became more powerful than ever; but Nemesis overtook her victim after all. Oretes, the Persian satrap of Sardis, had conceived a deadly hatred against Polyrates, and, having enticed the latter to visit him at Magnesia by appealing to his enmity, he seized and crucified him.

Polydipsia. See DIABETES.

Polydore Vergil. See VERGIL (POLYDORE).

Polygalaceæ. See MILKWEEDS.

Polygamous, a term applied to plants which bear both unisexual and hermaphrodite flowers, either on the same or on different individual plants. For example, the maple produces male, female, and hermaphrodite flowers on the same tree; while some ash-trees sometimes bear male only, others female, and others hermaphrodite flowers.

Polygamy obtained at one time over a very large area of the world's surface; in general it may be said still to be the rule not merely amongst most African races, but amongst the peoples both more and less civilised, of the East generally, and to a certain extent in Australia and Polynesia, though it is rare amongst American Indians. The ancient Egyptians practised it. That this custom was usual in Old Testament times is obvious from many references; the New Testament seems to indicate that monogamy was universal amongst the Jews of the 1st century, though the Talmud contains no positive prohibition against a plurality of wives. Greeks and Romans did not practise polygamy within historical times, the ancient Germans were the only barbarians known to Tacitus who were content with a single wife. Moslem

law and usage permit a man to have four, but such plurality is confined to the rich; poor men can seldom afford more than one wife (see MOHAMMEDANISM). There is no limit to the number of wives a Hindu may keep, without taking account of concubines. A high-caste man of wealth may sometimes have a hundred wives. But in this connection it should be remembered that in hot countries girls become marriageable at an early age, and soon lose their youth and attractiveness; a man's first wife may remain his confidant and real companion through life, though he provides himself with a succession of girl favourites. In China there is but one rightful wife in a household, though a man may, if he will, keep secondary wives or concubines.

Christianity has never tolerated polygamy; even Concubinage (q.v.) has been always treated as sinful, and polygamy is a crime by the law of Christian states. Nevertheless there have occasionally been found divines to defend polygamy or something like it. The Anabaptists insisted on such freedom; Oehno (q.v.) wrote in defence of it. When in 1540 Philip the Magnanimous, the reforming landgrave of Hesse, resolved with the consent of his wife (then a confirmed invalid) to marry a second wife, Luther and Melancthon approved the step 'as his personal friends, though not as doctors of theology'; and Bucer (q.v.) promoted, approved, and witnessed the bigamous union. The first wife survived the second marriage for nine years. As late as 1667, when Catherine of Braganza miscarried, some Anglican divines suggested polygamy as the best way of securing a direct heir to the throne. In 1780 the Rev. Martin Madan, chaplain to the Lock Hospital in London, startled the world and raised a violent controversy by arguing in favour of polygamy as a means of diminishing prostitution and saving human souls from guilt; the work in which these views were advocated was called *Thelyphthora, or a Treatise on Female Run* (3 vols. 1780-81). In recent times the Mormons (q.v.) by their practice of polygamy created a troublesome question for the administrators of United States law. It has always been a difficulty for Christian missionaries when converts with several wives desired baptism. As a rule the convert was treated as married only to the first wife in point of date, and was required absolutely to put away all the others—a rule that was inevitably harsh and inequitable in its operation. Bishop Colenso declined to make the convert part from wives he had married in good faith, so have other missionaries done elsewhere. See BIGAMY, FAMILY, HAREM, MARRIAGE, and the works cited there; also Gallican. *Women under Polygamy* (1914).

Polyglot (Gr. *polys*, 'many,' and *glotta*, 'tongue') means a collection of versions in different languages of the same work, but is almost exclusively applied to manifold versions of the Bible. The Hexapla of Origen (q.v.) contained, besides the Hebrew text, several other Greek versions, but is not commonly reckoned among the polyglots. The most famous polyglots are (1) the Complutensian, published under the auspices of Cardinal Ximenes (q.v.) at Alcalá (*Lat. Complutense*), in 6 vols. folio, 1502-17, with Hebrew, Greek, Chaldee (each with Latin versions), and the Vulgate Latin; (2) the Antwerp Polyglot, printed at the Plantin press, at the cost of Philip II. of Spain, in 1569-72, edited by Arias Montanus; (3) the Paris Polyglot, edited by Le Jay in 1645, in 6 splendid volumes; and (4) the London Polyglot, edited by Brian Walton, in 6 vols. folio, 1654-57, and containing the Bible, or parts of it, in nine languages. Of modern works of this kind the most convenient is Bagster's Polyglot, first published by Bagster at London in 1831 (new eds.

1874, &c.), which gives the Old Testament in eight languages (Hebrew, Greek, Latin, English, German, Italian, French, and Spanish), and the New Testament in nine (the Syriac version being added).

Polygnotus, a Greek painter who flourished in the middle of the 5th century B.C., was born in the isle of Thasos, and belonged to a family of painters. He was a friend of the Athenian general Cimón, and is said to have been attached to his sister, Elpinice. His principal works were at Athens, at Delphi, and at Platæa. In the first-named city he executed paintings in the temple of Theseus; in the Stoa Poikile (or Painted Portico), the Greek Princes assembled to judge of the Violation of Cassandra by Ajax; in the temple of the Dioscuri, the Rape of the Daughters of Leucippus; and in the Propylæa on the Acropolis, a series from the old Greek legends. At Platæa he painted, in the temple of Athena, Ulysses and the Slain Suitors of Penelope. His greatest work is said to have been in the Lesche, a court or peristyle at Delphi, built by the Cnidians, the walls of which he covered with a series representing the Wars of Troy and the Visit of Ulysses to the Lower World. Polygnotus was a great advance on any of his predecessors. He was the first who gave life, character, and expression to painting. Aristotle extols the dignity and beauty of his conceptions.

Polygonaceæ, a family of dicotyledons, mostly herbs, but including a few shrubs. The leaves are alternate, with stipules cohoring around the stem, though sometimes reduced to a mere ring. The flowers are not unfrequently unisexual; the fruit generally a nut, often triangular, the seed with farinaceous albumen, which has an economic importance in buckwheat. The genus *Polygonum* comprises numerous species, of which several are natives of Britain. Knot-grass (*P. aviculare*) is a very common British weed, and is found in cultivated and waste places in all parts of the world from the tropics to the Arctic regions. The stems of *P. amphibium*, an inhabitant of ponds and watery ditches all over Britain and Europe, central Asia, and North America, have been used as a substitute for sarsaparilla on the continent of Europe. *P. hydropiper*, often called Water Pepper, a plant common by sides of lakes and ditches in Britain and North America, is acrid enough to be used as a vesicant. Several species are occasionally used for dyeing, as the Spotted Persicaria (*P. Persicaria*), a very common weed on dung-hills and in waste places in Britain; but the only species really important on this account is that called Dyer's Buckwheat (*P. tinctorium*), a native of China, the cultivation of which has been successful in France and Flanders. It yields a blue dye scarcely inferior to indigo. *P. orientale* has long been occasionally cultivated in flower-gardens in Britain, and is quite hardy, although a native of the West Indies. The Bistort (q.v.) belongs to the genus. *Fagopyrum cymosum*, a species of buckwheat abundant on the mountains of the north of India, affords an excellent substitute for spinach. *Fagopyrum esculentum* (Buckwheat) is cultivated for the sake of its fruit, which furnishes a nutritious diet used in the countries of northern Europe. The Garden Sorrel (*Rumex Acetosus*) and some other species of *Rumex* have a singular combination of properties in their roots and in their leaves. In the former there is greater or less astringency, due to the presence of tannic and gallic acid; the latter are more or less acidulous, owing to their containing oxalic acid. The Dock (q.v.) belongs to this family; so does Rhubarb (q.v.). The root of *Calligonum leucocladum*, a native of the sandy

steppes of Siberia, when cut exudes a clear viscid gum similar to Tragacanth (q.v.), which swells in water and forms a mucilage of a brownish-yellow colour; it is eaten by the Kalmucks in times of scarcity. Its fruit, which is acid, is eaten to quench thirst. *Triplaris americana* and *T. Bonplandiana*, both natives of South America, are small trees with hollow branches which are the haunts of small venomous ants that shelter themselves on the unwary who may attempt to shelter themselves under their shade. *Muhlenbeckia adpressa* is the Macquarie Harbour Vine of Tasmania, an evergreen climbing or trailing shrub of most rapid growth, sometimes 60 feet in length. It produces racemes of fruit somewhat resembling grapes or currants, the nut being invested with the large and fleshy segments of the calyx. The fruit is sweetish and subacid, and is used for tarts. *Coccoloba uvifera* is the Sesside Grape (q.v.) of the West Indies. See also CALLIGONUM.

Polyhymnia, one of the nine Muses (q.v.).

Polymerism. See ISOMERISM.

Polymorphism. See DIMORPHISM.

Polynesia, Micronesia, and Melanesia.

These three areas comprise the greater part of the Pacific, Australia and the groups of islands ringing the Pacific coasts of Asia and of America being excluded. It is an island world. The islands extend from the Pelews (134° 45' E.) to Easter Island (109° 17' W.), and from Hawaii (20° N.) to Stewart Island at the southern extremity of New Zealand (47° S.). They are mostly small, so that in an expanse of 11 million square miles the extent of land is about 170,000 sq. m., two-thirds of which are comprised in New Zealand. The total population falls short of 14 millions. The three divisions of Micronesia, Melanesia, and Polynesia differ from each other markedly in race, and to some extent in culture. Micronesia is in the extreme north-west, almost entirely north of the equator. It consists of small coral atolls and volcanic cones, and is divided into the Marianas or Ladrões, the Pelews, the Carolines, and the Marshalls. Melanesia lies in the extreme west, entirely south of the equator. It mainly consists of comparatively large, upraised, coralline, crystalline, and volcanic islands, disposed in parallel chains from north-west to south-east, and forming the archipelagoes of the Admiralty Islands, Bismarck (New Britain and New Ireland), D'Entrecasteaux, Louisiade, Solomons, Santa Cruz, Banks, New Hebrides, New Caledonia, Loyalty, and Fiji. Polynesia lies on both sides of the equator, mainly east of a line drawn from Fiji to New Zealand. It consists of several archipelagoes—Hawaii (Sandwich), Phoenix, Ellice, Tokelau, Samoa, Tonga, Kermadec, Austral (Tubuai), Cook, Tahiti, Tuamotu (Paumotu), and Marquesas. New Zealand belongs to Polynesia. There are also several isolated islands and small groups, such as Norfolk, Chatham, Penrhyn, Easter, Manihiki, and Uvea.

The Pacific is uniform in climatic and biological conditions, with the exception of New Zealand which differs from the rest owing to its much greater size, its lofty mountain ranges, geological history, and high southern latitude. The trades prevail throughout the greater part of the year, while in the summer westerly and north-westerly winds occur frequently. These trades bring considerable rainfall to the higher islands, due to the oceanic conditions of the region. The rainfall decreases away from the equator. Over 150 inches fall annually in the Solomons, only 60 in Hawaii, and but 40 in New Caledonia. The coral atolls, too low to arrest the air currents, are rainless. They owe their guano deposits to this fact. The temperature is everywhere mild for the latitude, and varies little during the year. Mean tempera-

POLYNESIA, MICRONESIA, AND MELANESIA

tures of about 90° occur near the equator. The average falls to 50° in New Zealand, where the annual range is considerably greater. The climate of the tropical islands is very relaxing, but New Zealand and New Caledonia are healthier.

The majority of the food-plants of Oceania have been introduced by man. The flora of the coralline groups is essentially tropical. The prevailing species are the coconut and one or two other palms, the pandanus, the bread-fruit tree, the banana, and edible fruits such as yams, taro, and sweet potatoes. The large archipelagoes of the west have a rich forest vegetation, mostly belonging to the Papuanian and Australian zones, with some American and a few indigenous plants. Hence the prevalence of casuarinas, dammaras, araucarias, tree-ferns, besides myrtles, ebony, and the banyan fig.

The fauna is remarkably poor. The only undoubtedly indigenous mammals in the Polynesian groups are two or three species of rats and mice, and a few varieties of the bat family. Reptiles and insects are rare. Fiji is the easternmost limit of the frog, and the Solomons of the crocodile, which here lives both in salt and fresh water. Bird-life used everywhere to be abundant, but has been much reduced owing to the ravages of plume-hunters.

The products of the Pacific include copra, coconuts, pearls, pearl-shell, bananas, pine-apples, sweet potatoes, yams, sugar, tobacco, coffee, phosphates, oranges, tonatoes, rubber, and manioc.

The discovery of the groups of the Pacific began in the 16th century. Balboa saw the Pacific on 25th September 1513; Mendana discovered Fiji and Tonga in 1643; Roggeveen discovered Easter Island in 1721, and Samoa in 1722; and Captain Wallis discovered Tahiti in 1767.

The population of the Pacific presents interesting features. That of Micronesia is not well studied. It is mixed, and varies from west to east. The people at the west are more round-headed than those of the east, their skins are darker, and their hair is often frizzly, although sometimes wavy or straight. The people at the east end are very tall, while the people of the west are short. The original population of Melanesia was probably negroid in type—that is, black-haired, dark-skinned, medium of stature, long-headed with retreating foreheads, broad-nosed and with protruding jaws. Negritos still live in New Guinea.

Many views have been put forward to account for the racial affinities of the Polynesians. They have been claimed as constituting a uniform physical, cultural, and linguistic group. Some relate them physically to the Malays. They are also claimed as Nordic and as Mongolian, but actually the Polynesians are a mixed stock, and they themselves recognise their differences of physical type. Sullivan, on the basis of a large series of measurements, concludes that there are three physical types in Polynesia, and that the population was divided into two main groups. The first type was characterised by taller stature, longer heads, higher faces, narrower noses, straighter hair, more beard, more body hair, lighter skin colour, and more frequent incisor rim. The second type was characterised by shorter stature, shorter heads, lower faces, wider noses, more wavy hair, scant beard, scant body hair, darker skins, infrequent incisor rims. The second type is certainly related to the populations of the regions of the western Pacific and south-eastern Asia. Sullivan terms them Indonesian. When these are subtracted the Polynesians belong definitely to that group of races formerly termed Caucasian, and comprising (1) the Nordic; (2) the Mediterranean or Brown; and (3) the Central, Alpine, or Armenoid divisions. Elliot Smith has claimed the Polynesians to be the result of a mixture between the Armenoid or

Central race and the Brown or Mediterranean race, the mixture having taken place in the neighbourhood of India. He was led to this conclusion by the recognition of a skull of Armenoid type coming from the Chatham Islands in the southern Pacific. Sullivan has also detected this type in the light-skinned population of Polynesia. He speaks of 'an extremely short-headed element in Polynesia' with 'extremely short heads, associated with narrow faces, narrow noses, light skin, and well-developed beard and body hair.' This type is therefore characteristic of the so-called Alpine, Armenoid, or Central race. (Sullivan, *Marquesan Somatology*, 233 *seq.*, Honolulu, 1923.)

The proportion of the different elements of population varies widely in the groups of Oceania. The negroid population of Melanesia must have arrived in Oceania long ago, and have remained there, in a food-gathering stage of culture, throughout many centuries. The light-skinned Polynesians, on the other hand, are of fairly recent origin in Oceania. They probably arrived not more than 2500 years ago. They came from the west, it seems, by way of the East Indian Archipelago, and wandered through Micronesia and down the coasts of New Guinea into Melanesia and Polynesia. They brought with them the fundamental food-plants of Polynesia, the bread-fruit, banana, and others. Nothing is known directly of their wanderings in Melanesia, though their history in Polynesia is well known. Samoa was a great centre of migration whence expeditions set out to colonise Tahiti. The first centre in Samoa was probably in the small group of islands at the east end named Mann'a, the principal island being Tau. Mann'a is said to have colonised the rest of Samoa. In the first period of colonisation of Polynesia, our knowledge of which is very obscure, there was constant intercourse between Fiji, Samoa, and Tonga. Expeditions went from Tahiti to Hawaii, and also from Tahiti to New Zealand by way of Rarotonga. Tahiti was the great centre for eastern Polynesia. Colonies also went from Samoa to the Gilberts and other groups of western Polynesia at later dates. The languages of the Polynesians have affinities with those of certain peoples of India, Burma, the Malay Peninsula, Indo-China, the East Indian Archipelago and Madagascar.

The ancestors of the Polynesians introduced a civilisation that is uniform in its essentials with that of Pre-Columbian America, and especially with that of Peru. Its most obtrusive material characteristics were the building of monuments of large stones, the carving of stone statues, the practice of terraced irrigation, the making of polished stone implements, and the great use of shells, especially pearl-shell, for ornamentation. The social organisation was originally based on what is called the Dual Organisation. Communities were divided into two distinct parts, associated sometimes with the seaward and the landward parts of the islands. In the more important settlements these two parts were ruled over by distinct chiefs. One, the superior, was the sacred chief; the other, the inferior, was the war chief. Their families intermarried in certain places, and it is probable that this formerly was the general rule. Communities with the dual organisation usually have the rule of intermarriage between the two sides. In addition a man was often bound to marry the daughter of his mother's brother, which constitutes the 'cross-cousin' marriage. The original superior chiefs were of the family of the Children of the Sun. This remarkable family can be traced in Ponape of the Carolines, in San Cristoval, in Samoa, in Tahiti, and vaguely in Fiji. They had a cult of their ancestor, the sun, which died out everywhere with them. They

were connected with the sky, and believed that the sun could have children by mortal women. The family with which they intermarried in Samoa was associated with an underground world. When the children of the sun died out in Samoa and elsewhere the underworld became the principal land of the dead for the Polynesians. The ruling groups of this early civilisation practised mummification. They also put their dead in megalithic tombs, while commoners were interred. Government was carried out principally by means of councils, and the council of the state was composed of the great land owning nobles.

The remains of this original civilisation are scattered throughout the Pacific, the most remarkable being those of Ponape and elsewhere in the Carolines. Ponape possesses the ruins of a town built out in the sea, and protected by immense breakwaters made of basalt blocks. It was divided into two parts—one for the priests, ruled over by the *Chau-te-teur*, the Children of the Sun, and the other for the warriors. The stone tombs of these rulers exist in the Carolines. The people of the archaic civilisation in the Pacific made stone images. Those of Easter Island are enormous in size, but are similar in design and structure to those of Tahiti, the

Marquesas, and elsewhere.

Certain areas of the Pacific formerly possessed secret societies. The most important of these were the *Urutao* or *Urutao* of the Mariannes, the *Arenai* of Tahiti and neighbourhood, the *Dulduk* and *Tuget* of the Bismarck Archipelago, the *Matanibala* of Florida in the Solomons, the *Sukve* and *Tamete* of the Banks Islands, and the *Mwage* of Ambrym. The organisation of these societies with their rites of initiation, masks, dances, and payments of shell money, is similar throughout the Pacific.

Oceanic civilisation was fundamentally uniform in most respects, but there are local divergences. The culture of the Micronesians is at a very high level, especially in the Carolines. They make splendid club houses. Their villages have paved paths, stone landing stages, and stone dancing platforms. They have elaborate irrigation canals. Their commerce was formerly highly developed. They had a currency of beads and shell, practised writing, and made charts of cane-work, which served them on their long voyages. The Melanesians practise tattooing, cicatrization and nose-boring, and wear armlets and necklaces of shells. Houses are rectangular or round, and pile-dwellings are common. Irrigation is widespread. Cannibalism occurs in various parts. Canoes are made, both dug-out and plank-built. Various forms of currency are in use, shell discs being universal. Pottery is made in Fiji, New Guinea, and in the New Hebrides. Looms occur in Santa Cruz. Various sorts of weapons are used, such as the club and the spear, the bow and arrow and the sling, while shields occur sporadically. Head-hunting is practised in the Solomons and in Torres Straits. Chieftainship is not common, but secret societies are very powerful. Much of the religion

centres round the cult of the ghosts of the dead. The Polynesians are great navigators, their canoes formerly making journeys of thousands of miles. Their houses are usually rectangular. They live chiefly on bread fruit and taro; the latter plant is usually grown by irrigation. Clothing was of bark-cloth made from the paper mulberry (*Morus papyrifera*). Tattooing was common. Ornaments were made of shell and whale ivory, and feathers were largely used to make cloaks and helmets for the chiefs. Polished stone implements were made, as in other parts of the Pacific. Clubs were the most important weapons, but spears and daggers were also used, whereas the bow and arrow was only a toy. The musical instruments were drums, shell trumpets, flutes, and whistles. Many dances were performed. The system of tabu was associated with the ruling groups, and with secret societies in other parts of Oceania. The most important gods of later times were the war gods, superseding the sun-cult as the dominant religion.

The following table gives the ascertainable populations of the various groups. The positive or negative sign denotes an increasing or decreasing native population:

	Area in sq. miles	Population (Native)	Increase or Decrease	State or Mandate
MICRONESIA—

Polyp, a name usually applied to an animal

like the fresh-water Hydra or like the Sea-anemone, having a tubular body and a wreath of many tentacles around the mouth. The name is equally applicable to an isolated individual or to a member (zoid or 'person') of a colony. Thus, the individuals which make up a zoophyte or a coral colony are called polyps, and the term is seldom used except in reference to Cœlenterate animals. But the history of the word has been strange. In Greek and Latin works on natural history the term *polyposus* or *polypos* is usually applied to the octopus (*poulpe*), or some other cuttle-fish, though sometimes to the many-footed wood-louse, *Oniscus*. Réaumur and Jussieu were the first to apply the word to zoophytes and the like; Lamarck used it more loosely, but gradually it has been narrowed to the signification above noted. See ANEMONE, CœLENTERATA, CORAL, HYDRA, HYDROZOA, &c.; and POLYPUS, for the surgical use of the term.

Polyphemus, in the Homeric mythology, the son of Poseidon and the nymph Thoosa, the most celebrated of the fabulous Cyclopes (q.v.), who inhabited the island of Sicily. He was of immense size, and had only one eye. When Ulysses landed on that island he entered the cave of Polyphemus with twelve companions, of which number this tremendous cannibal ate six. The others stood expecting the same fate, but their cunning leader made Polyphemus drunk, then burned out his single eye with a burning pole, and so escaped, leaving the blinded monster to grope about in the darkness. See ACI REALE.

Polyphonic (Gr. *polys*, 'many,' and *phōnē*, 'voice'). When a musical composition consists of two or more parts, each of which has an independent melody of its own, it is said to be polyphonic, in opposition to a homophonic composition consisting of a principal part with a leading idea, and accessory parts employed to strengthen it. Each part of a polyphonic composition aims at melodic perfection, and, while supporting the other, has an equal share in the entire effect. A Fugue (q.v.) is the most perfect example of polyphonic composition.

Polypodium (the Greek name, as old as Theophrastus, was *polypodion*, from *polys*, 'many,'

Polypodium :
1, *Polypodium Dryopteris*; 2, *P. vulgare*.

and *podion*, 'a little foot'—indicating the foot-like appendage of the rhizome, not the leaf), a genus of Ferns, with spore-cases on the back of the frond, distinct, ring-shaped, in roundish sori, destitute of *indusium*. It is the largest genus of

the Filices, comprising some 600 species; and amongst them are plants of different modes of growth, of different venation, and from almost all climates. Several species, differing very considerably in appearance, are natives of Britain, where no fern is more common than *P. vulgare*. It grows on rocks, trees, dry banks, &c., and has fronds 2 to 18 inches long, deeply pinnatifid, with large sori. *P. Dryopteris*, with delicate ternate bipinnate fronds, is a fine ornament of many dry stony places in Scotland. *P. calaguala*, a native of Peru, is said to possess important medicinal properties—solvent, deobstruent, sudorific, &c.

Polyporus, a genus of basidiomycete fungi, many of them large, hard, woody, bracket-like or hoof-like parasites on trees. The porous appearance is due to a closely-packed mass of tubes. See AMADOU, DRY ROT.

Polypterus, an interesting genus of African fishes, from the Nile, the Congo, and some other rivers. The various (10) species of *Polypterus*, along with one other fish, *Calamichthys calabaricus*, from the Niger, Old Calabar, and other West African rivers, are the only living representatives of the archaic Crossopterygii, and may be fairly called living fossils. See *Budgett Memorial Volume*, Cambridge (1910).

Polypus, in Surgery, is an ancient term employed to signify any sort of pedunculated tumour attached to the surface of a mucous membrane, to which it was supposed to adhere like a many-footed animal, as its name indicates. The most common seats of polypus are the nose and the uterus; but these tumours are also found in the rectum, the larynx, and the external auditory passage of the ear. The only satisfactory mode of treatment consists in their removal, which must be effected in various ways, according to their position, as by the forceps, *écraseur*, ligature, &c. The cause of the polypus is often some local inflammation which must also receive appropriate treatment.

Polytechnic (Gr. *polys*, 'many,' *technē*, 'art') is an institute in which the technical sciences that rest in great part upon a mathematical basis, such as engineering, architecture, &c., are taught. The first school of the kind was established in Paris (1794) by the National Convention, under the name of School of Public Works. No students were admitted but those who intended to enter the public service, especially the corps of civil and military engineers and the artillery. The *École Polytechnique*, as it was called from 1795, has been repeatedly reorganised as the different political parties have succeeded to power. At the present time it is the institute in which France trains her artillery and engineer officers, and all her officials who require to know something of the higher branches of technical science. Germany, too, has her polytechnics, or *Technische Hochschulen*. Those that came into being during the first half of the 19th century were in great part training-schools for the higher branches of the industrial arts; but since Zurich established (1856) a polytechnic modelled on the plan of the German universities, most of the German polytechnics have followed suit. In America the oldest institutions of the kind are the Rensselaer Polytechnic Institute at Troy, New York, and the Franklin Institute at Philadelphia, both founded in 1824. See TECHNICAL EDUCATION; also ART.

Polythelms. See RELIGION.

Polytrichum, a genus of Mosses (q.v.).

Polyzoa, or BRYOZOA, a class of small animals which, with one exception, form colonies, and are

almost always fixed. Most familiar are the sea-mats or horn-wracks (*Flnstra*), cast-up pieces of which are abundant on the beach. On these will be seen the hundreds of separate chambers in which the minute individuals live. Each individual has a sac-like or cup-shaped body, traversed by a food-canal bent like a U, crowned around the mouth by a wreath of tentacles, controlled by a single nerve-centre. The ctenicle which surrounds the body is usually horn-like, not unfrequently calcareous (*Cellepora*, *Leprelia*, &c.), and sometimes gelatinous (*Aleyonidium*, *Lophopus*). The individuals of a colony are not always all alike; thus, some of them are occasionally modified into strange birds-beak-like or whip-like structures. All *Polyzoa* multiply by budding, and thus the colonies increase. The individuals in the older parts of the colony usually degenerate or die. Fresh-water forms reproduce by peculiar winter-buds or statoblasts, which are liberated on the death of the parent, are floated away by currents, and after a winter's quiescence develop in spring. But all *Polyzoa* also reproduce sexually; the sexes may be separate or united; the larvæ developed from the eggs are free-swimming. The *Polyzoa* used to be ranked with zoophytes (among the *Hydrozoa*), but the individual animals are much more complex and are independent of one another. Often they are called molluscoid, because of apparent affinities with lamp-shells or Brachiopods, which used to be regarded as allied to molluscs. Most modern zoologists rank them as a distinct but heterogeneous class in the great assemblage of 'worms' or 'Vermes.' Representative genera are *Cristatella*, *Lophopus*, *Plumarella*—in fresh water; *Flustra*, *Membranipora*, *Aleyonidium*, *Cellepora*—marine; *Pediceolina* and *Loxosoma*—two marine genera, simpler than the others, the latter non-colonial. *Rhabdopleura*, a remarkable genus sometimes included in this class, shows at least hints of vertebrate affinities.

See Allman, *British Fresh-water Polyzoa* (Lond. 1886); Busk, *Challenger Report*, X. (1884); Hincks, *British Marine Polyzoa* (Lond. 1880); E. Ray Lankester, article 'Polyzoa' in *Ency. Brit.*

Pomaks, Mahomedan Bulgarians. See **BULGARIA**.

Pombal, SEBASTIAN JOSEPH DE CARVALHO E MELLO, MARQUIS OF, the greatest of Portuguese statesmen, was born 13th May 1699 at the castle of Soure, near Coimbra. In 1739 he was appointed ambassador in London, and six years later was sent to Vienna in a similar capacity. Just before Joseph I. ascended the throne of Portugal (1750) Pombal was appointed secretary for foreign affairs. Among his first acts was to re-attach to the crown a number of domains that had been unjustly alienated. When the great earthquake happened at Lisbon in 1755 Pombal displayed great calmness and fertile resource, so that next year the king made him prime-minister. He crushed a revolt instigated by the great nobles and the Jesuits, and in 1759 banished the latter from the kingdom. Then he set himself to establish good elementary schools, and published a new code of laws. Besides this, he reorganised the army, introduced fresh colonists into the Portuguese settlements, established an East India Company, and another for Brazil. The tyranny of the Inquisition was broken. Agriculture, commerce, and the finances were all improved. In 1758 he had been made Count of Oeyras, and in 1770 he was created Marquis of Pombal. On the accession of Joseph's daughter, Maria I. (in 1777), who was under clerical influence, Pombal, who had himself been high-handed, if not despotic, especially towards the Church, was banished from court, while many of his institutions

were abolished. He died at his castle of Pombal, 8th May 1782.

See *Life* by G. Moore (1819); John Smith, *Memoirs of Pombal* (2 vols. 1843); Carnota, *Marquis Pombal* (Eng. trans. 1871); and Carayon, *Prisons du Marquis de Pombal*—his diary (Paris, 1865).

Pomegranate (*Punica Granatum*), a fruit much cultivated in warm countries, and apparently a native of the warmer temperate parts of Asia and Europe, perhaps also of the north of Africa. It has been cultivated in Asia from the most ancient times. In a wild state the plant is a thorny bush, in cultivation it is a low tree, with twiggly branches, flowers at the extremities of the branches, the calyx red, the petals scarlet. It is generally referred to the family Myrtaceæ. The calyx is leathery, tubular, 5- to 7-cleft; there are 5 to 7 crumpled petals; the fruit (technically called *balausta*) is as large as a medium-sized orange, having a thick leathery rind of a fine golden yellow, with a rosy tinge on the sunny side, not bursting when ripe; the cells filled with numerous seeds, each of which is surrounded with pulp, and separately enclosed in a thin membrane; the upper and lower series of carpels being differently attached. Thus the pomegranate appears to be formed of a great number of reddish berries packed together and compressed

Pomegranate (*Punica granatum*).

into irregular angular forms. The pulp is sweet, sometimes subacid, and of a pleasant delicate flavour, very cooling, and particularly grateful in warm climates. It is often used for the preparation of cooling drinks. A kind of pomegranate without seeds is cultivated and much prized in India and Persia. Pomegranates have long been imported in small quantities into Britain from Portugal and the north of Africa, but have never become an article of general demand and commercial importance like oranges. There is an ornamental variety of the pomegranate with double flowers. The rind of the fruit is very astringent, and a decoction is used as a gargle in relaxed sore throat, and as a medicine in diarrhoea, dysentery, &c. Deriving its astringency from tannin, it is used to tan leather. The finest Morocco leather is said to be tanned with it, and small quantities are imported into Britain from the north of Africa for the preparation of the finest kinds of leather, under the name of *Pomegranate Bark*. The bark of the roots is used as an anthelmintic, and is often successfully administered in cases of tapeworm. It contains a peculiar principle called *punicin*, having the appearance of an oleo-resin, an acid taste, and affecting the nostrils like *Veratrum* (q.v.). Its value was known to the ancients, and it has long been in use in India. The pomegranate tree is occasionally cultivated in hothouses or greenhouses in Britain. It bears the winters of the latitude of London in the open air, and is very ornamental, but the fruit is worthless. In some parts of the north of Persia it is cultivated as a

American Union; even as far north as New York it will, if protected in winter, bear fruit, and in some seasons ripen it.

Pomelo. See SHADDOCK.

Pomerania (Ger. *Pommern*), a province of Prussia, bounded N. by the Baltic, E. by Poland, S. by Grenzmark and Brandenburg, and W. by Mecklenburg. Area, 11,661 sq. m. It is one of the lowest and flattest regions in Germany, and has few hills of even moderate height, but numerous lakes and ponds. The river Oder divides Hither Pomerania (next Mecklenburg) from Farther Pomerania. The shores of the latter are lined with sand-dunes. The islands of Wollin and Usedom form the northern side of the Stettiner Haff (Lagoon); and farther to the north-west lies the island of Rügen. Pomerania is essentially an agricultural province. Rye and potatoes are the principal products; in a secondary degree come wheat, barley, oats, flax, beet-root, tobacco, hops, and fruit. Commerce flourishes in the coast towns, Stettin and Stralsund being the most important. Apart from shipbuilding, machine-works, and the manufacture of sugar, chemicals, bricks, &c., carried on principally in the coast towns, the industries are paper, tobacco, glass, and woollen wares. The fisheries are valuable. Much poultry is reared, especially geese, in Farther Pomerania. Greifswald is the seat of a university; Stettin is the capital. Pop. (1919) 1,789,216. See PRUSSIA; and for the Pomeranian dog, SPRIZ.

Pomerania formed a part of the territory of the ancient Vandals. When they moved south in the 5th century, it was occupied by Slavic tribes, one of whom was called Pomerani; hence the name of the region. From about 1100 it had its own line of princely rulers, and about 1124 it adopted Christianity in consequence of the preaching of Bishop Otto of Bamberg. The native princes assumed the title of duke in 1170 and joined the German empire, being put under the suzerainty of Brandenburg. The duchy was overrun by the Imperialists in the Thirty Years' War, and Wallenstein besieged Stralsund; they were followed by the Swedes, who established themselves permanently in Hither Pomerania and in several towns of Farther Pomerania. In 1637 the last duke of the native dynasty died, whereupon Brandenburg claimed the duchy; the Swedes, however, stuck to what they held until 1720, and certain districts in Hither Pomerania were not given up to Prussia until 1815.

Pomerellia, POMMERELLIA, or LITTLE POMERANIA, Poland's north-western corridor to the Baltic in Pomerze (q.v.), inhabited by Kashubish (q.v.) speakers.

Pomeroy, capital of Meigs county, Ohio, between the Ohio River and a range of precipitous hills, 133 miles by rail SE. of Columbus. Coal and salt are produced. Pop. 4300.

Pomfret. See PONTEFRACT.

Pomfret, JOHN (1667-1702), son of the rector of Luton, Bedfordshire, was from 1695 rector of Maulden, also in Bedfordshire. The only piece of Pomfret's now remembered—we can hardly say read—is *The Choice*, a graceful but tame and monotonous celebration, in neat verse, of the mild joys of a country retirement. Dr Johnson said that perhaps no poem in our language had been oftener perused; and Southey still asked why Pomfret was the most popular among the English poets.

Pomona, the Roman divinity of the fruit (*pomum*) of trees. She was beloved by several of the rustic divinities, as Sylvanus, Picus, and Vertumnus. Propertius tells us that the last, after vainly trying to approach her under various forms,

at last succeeded by assuming the figure of an old woman. In this guise he recounted to her the lamentable histories of women who had despised love, and, having touched her heart to pity, suddenly transformed himself into a blooming youth. Varro tells us that at Rome the worship of Pomona was under the care of a special priest, the *flamen Pomonalis*. In works of art she was generally represented with fruits in her lap, or in a basket, with a garland of fruits in her hair, and a pruning-knife in her right hand.

Pomona, or MAINLAND. See ORKNEY.

Pomorze, a Polish county or voivodeship consisting of the greater part of the former Prussian province of West Prussia. A continuation of the North German plain, it is cut across, in the south, by the Vistula, which farther north separates it from the Marienwerder district of Germany and from Danzig, and then enters the territory of Danzig. The north of Pomorze is thus narrowed to a strip (Pomerellia) which reaches the Baltic between Danzig and Pomerania. On its coast a seaport is being constructed at Gdynia, adjoining Danzig. Area, 6302 sq. m.; pop. (1921) 939,495; capital, Thorn (Polish Toruń).

Pompadour, JEANNE ANTOINETTE POISSON, MARQUISE DE, the most famous among the mistresses of Louis XV., was born in Paris, 29th December 1721. She was baptised as the child of François Poisson and his wife Madeleine de la Motte, but it was suspected that her father was Le Normant de Tournehem, a wealthy *fermier-général*, who provided for her education. She grew up a woman of remarkable grace and beauty, devoted to music and painting, and charmed every one by her vivacity and wit. But her mind was early depraved by her mother, who constantly dinned into her ears that she was 'un morceau de roi,' and habituated her to see in the rôle of king's favourite the ideal of feminine ambition. In 1741 she was married to her protector's nephew, Le Normant d'Étiolles, and soon became a queen of fashion in the financial world of Paris. But neither this nor a devoted husband's love could satisfy her heart, and as it was impossible to hope for an introduction at court, for two years she sought to attract the eye of the king by waylaying him when he went out hunting. At length in February 1745 she attained her object at a ball given by the city on the occasion of the dauphin's nuptials, and ere long she was installed at Versailles, and ennobled by the title of Marquise de Pompadour. Her husband, to whom she had already borne a daughter, was removed from Paris, but later had his loss recompensed with lucrative offices; her brother was afterwards made Marquis de Marigny. Ere long she assumed the entire control of public affairs, the king being merely an indolent *fainéant* who assisted at the spectacle of his reign without even taking an interest in it. For twenty years the mistress swayed the whole policy of the state, and lavished its treasures on the gratification of her artistic tastes, and in carrying out her own ambitious schemes. She reversed the traditional policy of France because Frederick the Great had spoiled her, and the proud Maria Theresa addressed her in a letter under the royal style as *Ma cousine*. She filled all public offices with her nominees, corresponded with the generals in the field, and made her own creatures ministers of France, the Abbé de Bernis and the Duc de Choiseul. Her policy was disastrous, her wars unfortunate; still the ministry of Choiseul was the only fairly creditable portion of the reign, which owed to her twenty years of relative dignity. She was a lavish patroness of the arts, and heaped her bounty upon poets and painters, yet did not escape showers of

lampoons—the famous *Poissardes*, for a suspected share in which many a wit went to the Bastille. She loved china, fine buildings, books, and sumptuous bindings, and it is said printed with her own hands a fine edition of the *Rodogune* of Corneille. Indeed, she was an artist in everything—‘elle était des nôtres,’ as Voltaire said truly when he heard of her death. The king remained faithful to her from habit rather than affection, and from the rôle of mistress she passed into that of *amie nécessaire*, and retained her difficult position to the end, by relieving him of all business, by diverting him with private theatricals in her famous ‘théâtre des petits cabinets,’ where she acted charmingly, and at last even by countenancing his infamous debaucheries and providing him with mistresses too insignificant to be rivals. She herself said with the pathos of truth, ‘ma vie est un combat,’ and at last her nerves gave way under the strain, and after a languor of twenty days she died, 15th April 1764. She met the inevitable with that queenly dignity that marked everything she did. Her breath fled on the wings of a playful sally—‘Stay, Monsieur le Curé,’ she said to the priest who was leaving her room, ‘wait a little; we shall go out together.’

Madame de Pompadour was the last mistress of the king worthy of the name; the descent from her reign of grace and decorum to the boisterous vulgarities of Dubarry was profound. She was ‘froide comme une macreense,’ says Madame du Hausset, her *femme-de-chambre*, in her silly but interesting memoirs, and there can be no doubt that throughout life ambition was the one passion of her heart. She secured her reign till her last hour—no sooner had she closed her eyes than she was forgotten.

The *Mémoires* (Liège, 1766) attributed to her are of no value. See the studies by Capeigne (1858) and Campardon (1867); E. and J. de Goncourt, *Les Maîtresses de Louis XV.* (vol. ii. 1860); Beaumont’s *Secret Memoirs of La Marquise de Pompadour* (1885); her *Correspondance*, edited by Malassis (1878) and Bonhomme (1880); books by H. Noel Williams (1903), Pierre de Nolhac (1913), Marcel Tinayre (trans. 1925).

Pompeii, an ancient seaport town of Campania, originally situated near the mouth of the Sarnus, which now, however, enters the sea nearly 2 miles distant. It occupies the top of a small hill of lava, and was situated on the line of a trade route, which, from the earliest times, connected the districts of Naples and Capua with the Sorrento promontory. The original settlement is represented by a small, irregularly-planned nucleus of streets in the south-west portion of the town, which was founded by the Oscans; while the regular street plan of the enlarged town is probably due to the Etruscans, though Pompeii was also largely influenced by the Greek civilisation of the coast. In the second half of the 5th century B.C. the Samnites from the mountains of the interior swept over Campania, but adopted the arts and customs which they found there. Pompeii passed under the sway of Rome with the rest of Campania in the early 3d century B.C., but took a prominent part in the Social War (91–89 B.C.), and was one of the last cities of Italy to be reduced by siege. In 80 B.C. Sulla settled a military colony in its territory, and the population was rapidly Romanised, the neighbourhood becoming a favourite resort of the Roman nobles, among them Cicero, who alludes frequently to his Pompeian villa. Its prosperity continued under the empire, but was checked by a serious earthquake in 63 A.D. A large part of the town, including most of the public buildings, was so seriously damaged as to require reconstruction, which was still in progress when the whole city was overwhelmed by the great eruption of Vesuvius in 79 A.D.

G. Fiorelli (d. 1896) was responsible for the

division of the city (for convenience of reference) into nine regions (now only six), for their subdivision into *insulae*, or blocks, consisting of one or more buildings or houses, and for the names of the streets and houses. About one-half of the whole extent has been cleared; but of recent years attention has been concentrated entirely on the careful investigation of the north-eastern portion of the Strada dell’ Abbondanza, and the slowness of progress has been compensated for by the exceptionally interesting discoveries made, coupled with the greater care with which the work of preservation has been carried out. The greatest gain has been our increased knowledge of the upper stories of the façades of the houses, which (contrary to what was hitherto believed) were diversified by numerous openings—balconies, open loggias, &c. Some interesting paintings have been found on the *acades* themselves, and have been most carefully reserved. But at the present rate of progress there is no likelihood that the work will be completed during the present century.

The city forms an irregular ellipse, rather less than 1 mile in circumference, extending from the amphitheatre on the east to the Herculaneum gate on the west, where the street of tombs begins. Seven other gates traversed the walls, the line of which had, however, been obliterated on the south-west, inasmuch as they were no longer required for purposes of defence. A *trattoir* borders the streets, which are straight and narrow—the broader 24 feet wide, the narrower 14 feet only—and admirably paved with polygonal blocks of lava. High stepping-stones, placed mostly at the corners, lead across from one *rottoir* to another, and these retain the impressions of horses’ hoofs, while, in the causeway between the wagons have left deep ruts. The street-corners are provided with fountains, ornamented usually with the head of a god or a mask. Notices painted in red letters, and referring to municipal elections for which some particular candidate is recommended, occur frequently on the street walls, while trade signs and advertisements are rarer. An occasional phallus, to avert the evil eye, projects from over a doorway, and, much more common, one or two large snakes, emblems of the Lares, are to be seen. The stuccoed walls, to judge from the *Graffiti* (q.v.) or roughly-scratched drawings on them, were as tempting to the Pompeian *ganym* as to our own, though adult lovers often gave way to the temptation.

The portion of the city which has been excavated includes the more important public buildings—the forum (the centre of the life of the city), with the edifices adjacent to it, the Capitolium, which every Roman colony possessed, dedicated to Jupiter, Juno, and Minerva, and the temples of Apollo and Vespasian, the Basilica, the *Atrium* or Senate-house, and other municipal buildings; also the temples of Hercules (so-called), Isis, Zeus Melichios, Fortuna Augusta, and Venus Pompeiana, the two theatres and the amphitheatre, the barracks of the gladiators, three public baths, &c., and a large number of fine private houses. The nucleus of their plan is the *atrium*, or central space, with an opening (the *impluvium*) of greater or less size in the centre, sometimes indeed developed into a peristyle courtyard, and rooms all round it, with a garden at the back; while the larger houses have one or more *peristyles* in place of the garden. Elaborate precautions were thus taken against heat, but hypocausts are only found in connection with baths, as at Rome itself; though the scanty use of window-glass must have made the houses very cold—as the wallings of the poorer classes still are. Recent discoveries at Ostia (q.v.) have shown that the Pompeian house is not to be regarded as the main type of Roman domestic architecture.

House-construction consists mainly of concrete (rubble held together by cement) or brick, and sometimes of stone blocks, especially at the corners. Two-storied houses are numerous, though the upper floors, built of wood, have been consumed by the eruption. Shops usually occupied the ground floors of dwelling-houses, on their street aspect, let out to merchants or dealers as at the present day, but not connected with the back part of the house. They could be separated from the street by large wooden doors, while inside they had tables covered with marble, in which earthen vessels for wine or oil were inserted. The shopkeeper had sometimes a second room at the back, when he did not live on an upper floor or in another part of the town. Retail traffic must have been considerable at Pompeii, to judge from the number of shops along the streets.

An exhaustive study has recently been made of the occupants of the various houses, and the names given to the latter have in many cases been shown to be incorrect. Especially as rebuilt after 63, Pompeii shows little marble facing (and what had been used was in some cases removed after the destruction of the city), the walls and columns being covered with a coating of stucco, which presented an ample field for ornamental painting. This has been divided into four styles—a classification which can only be regarded as provisional; for far finer contemporary examples from Rome itself still await study and publication. The earliest or structural style came in from Asia Minor or Greece (perhaps by way of Sicily) about the end of the 2d century B.C. In it marble facing is imitated in aetna relief, but in the second style only by painting on a flat surface, while in it architectural designs begin to appear, framing pictorial scenes, which are supposed to be seen through openings in the wall. While this style may have developed in Italy itself, it is probably modelled on Hellenistic stage decoration, in which columns with screens between them were placed in front of the back wall of the stage.

If we follow the traditional classification we shall find the third style characterised by a free use of ornament, whereas the architecture has become quite fantastic; while the fourth is distinguished from it by a return to architectural forms, though these are of far greater intricacy than before. Some of the floor-mosaics, especially those corresponding with the first period of mural decoration, are very fine.

A number of houses, many of them farmhouses, have also been discovered in the vicinity of Pompeii. One of them, in the so-called Villa Itern, has some very fine life-size figures representing scenes in the mysteries of Dionysus.

Owing to the circumstances of the burial of Pompeii, the works of art found, and especially the statues, are exceptionally numerous. Many of them, and especially those found in the earlier excavations, have been removed to the Naples Museum; but latterly they have been left on the spot, and this, especially when the buildings found have (as recently) been carefully repaired and reconstructed as far as is possible, adds greatly to the vividness of the picture of ancient life which this wonderful city presents. Perfect casts in plaster of Paris have been obtained, not only of the bodies of those who perished, but of doors, ladders, roots of trees, &c. The best work on the subject for the English reader is Mau's *Pompeii: its Life and Art*, translated by F. W. Kelsey (1902; a new edition is in preparation). A useful summary of recent work by A. W. Van Buren will be found in the *Classical Journal* (of America), xv. (1920), pp. 404 *sqq.*

Pompelmoose, or POMELO (Dut. *pompelmoes*), also 'pumelon' and 'pomelo,' a kind of Shaddock (q.v.), *Citrus decumana*, var. *Pompelmoes*.

Pompey. Cneius Pompeius Magnus, the rival of Caesar, was born in 106 B.C., and at seventeen fought along with his father in the Social or Italian war on the side of Sulla against the faction of Marius and Cinna. When Sulla returned from Greece to Italy to oppose Marius (84) Pompey hastened into Picenum, and there raised an army of three legions, with which he drove the soldiers of Marius out of the district, and then joined Sulla. For his prudence, valour, and good fortune throughout the war he was sent to destroy the remains of the Marian faction in Africa and Sicily. On his triumphant return to Rome he was honoured with the name of Magnus, or the Great. His triumph was an unprecedented distinction for one who had not yet held any public office and was merely an *eques*. His next exploits were the reduction of the followers of Lepidus, whom he drove out of Italy, and the extinction of the Marian party in Spain under the brave Sertorius (76-71). Pompey suffered some severe defeats from Sertorius, and, indeed, put an end to the war only after his antagonist's assassination. Returning to Italy, he fell in with the remnants of the army of Spartacus, and thus closed the Seville war. He was now the idol of the people, and, though legally ineligible for the consulship, was elected for the year 70, the senate relieving him of his disabilities rather than provoke him to extremities. Hitherto Pompey had belonged to the aristocratic party, but of late years he had been looked upon with suspicion by some of the leading men, and he now publicly espoused the people's cause. He carried a law restoring the tribunician power to the people; and aided largely in introducing the *Lex Aurelia*, by which the *judices* should for the future be taken from the *senate*, the *equites*, and the *tribuni aerarii*, instead of from the senate alone. In 67-66 Pompey cleared the Mediterranean of the pirates who infested it; and during the next four years (65-62) conquered Mithridates, king of Pontus, Tigranes, king of Armenia, and Antiochus, king of Syria. At the same time he subdued the Jews and captured Jerusalem. On his return to Italy he disbanded his army, and entered Rome in triumph for the third time in 61. But now his star began to wane. Henceforward we find him distrusted by the aristocracy, and second to Caesar in popular favour. After his return he was anxious that his acts in Asia should be ratified by the senate, and certain lands apportioned among his veterans. But the senate declined to accede to his wish, and he therefore formed a close intimacy with Caesar, and the pair, together with the plutocrat Crassus, formed that coalition which is commonly called 'the First Triumvirate,' and which for a time frustrated all the efforts of the aristocratic party. This small oligarchy carried all before them: Pompey's acts in Asia were ratified, and his promises to his troops fulfilled; Caesar's designs were all gained, and his agrarian law, distributing land in Campania among the poorer citizens, was passed. Caesar's daughter, Julia, was given in marriage to Pompey, and private relationship was thus made to bind tighter the tie of political interest. In the year following Caesar repaired to Gaul, and there for nine years carried on a career of conquest that covered him with glory, while Pompey was idly wasting his time and his energies at Rome. But Pompey could not bear a rival. Jealousies arose between the two; Julia died in 54, and thus father-in-law and son-in-law were sundered by a yet wider gulf, which no bridge could span. Pompey now returned to the aristocratic

party, whose great desire was to check *Cæsar's* views, and strip him of his command. *Cæsar* was ordered to lay down his office and return to Rome, which he consented to do, provided Pompey, who had an army near Rome, would do the same. The senate insisted on an unconditional resignation, and ordered him to disband his army by a certain day, otherwise he would be declared a public enemy. To this resolution two of the tribunes in vain objected; they therefore left the city and cast themselves on *Cæsar* for protection. It was on this memorable occasion that he crossed the Rubicon, and thus defied the senate and its armies, which were under Pompey's command. The events of the civil war which followed have already been recorded in the life of *Cæsar*. It remains only to mention that, after being finally defeated at Pharsalia in 48, Pompey escaped to Egypt, where, according to the order of the king's ministers, he was treacherously murdered by a former centurion of his own, as he was landing from the boat. His head was cut off, and afterwards presented to *Cæsar* on his arrival in Egypt. But *Cæsar* was too magnanimous to delight in such a sight, and the murderer of Pompey was by his orders put to death. The body lay on the beach for some time, but was at length buried by a freedman, Philippus, who had accompanied his master to the shore.

Pompey's younger son, Sextus, by his third wife, endeavoured after his father's death to prolong the struggle with *Cæsar*. He secured a large fleet, manned largely by slaves and political exiles, and, occupying Sicily, ravaged the coasts of Italy. But in 36 B.C. he was defeated at sea by Agrippa, and next year was slain at Mitylene.

Pompey's Pillar, a red granite Corinthian monolith at Alexandria, 73 feet high (with pedestal, 98 ft. 9 in.), 29 ft. 8 in. in circumference. On the summit is a circular depression for the base of a statue. The name was given by old travellers; the Greek inscription on the base shows that it was erected by Pablinus, prefect of Egypt, in honour of Diocletian, perhaps to record his conquest of Alexandria, 296 A.D.

Pomponatius, PETRUS (Pietro Pomponazzi; 1462-1525), 'last of the Schoolmen and first of the Aristotelians', was born at Mantua, taught philosophy in Padua and Bologna, and maintained that the doctrine of individual immortality, though contrary to reason, might be received by faith. See monograph on his psychology and philosophy by Halliday Douglas (1910).

Pomptine, or **Pontine Marshes**, the southern part of the province of Rome, extending SE. from Velletri to the sea of Terracina, but separated from the sea by sand-dunes. Many attempts have been made to drain these marshes, from that of Appian Claudius (312 B.C.) till a law of 1899 provided for reclamation in twenty-four years, under which considerable progress has been made, the installation of electric pumping stations and the boring of artesian wells being the principal factors in making cultivation and habitation possible.

Ponapé. See CAROLINE ISLANDS.

Ponce de León, FRAY LUIS, otherwise FRAY LUIS DE LEON, one of the greatest of Spanish poets, was born in 1527, probably at Gramada. He studied at Salamanca, entered the order of St. Augustine, and became professor of Theology there in 1561. His translation and interpretation of the Song of Solomon brought him five years' imprisonment from the tribunal of the Inquisition at Valladolid. Released at length and reinstated in his chair, he quietly resumed his lectures with the words: 'As we observed in our last discourse' In 1580 he published a satisfactorily orthodox Latin

commentary on the Song of Solomon, later his *De los Nombres de Cristo* (1583-85) and *La Perfecta Casada* (1583), full of imagery, eloquence, and enthusiasm, and both in prose. Shortly before his death, which occurred in August 1591, he had been appointed general of his order. His poetical remains were first published by Quevedo at Madrid in 1631, under the title *Obras Proprias y Traducciones*. The latter consist of translations from Virgil's *Eclagues* and *Georgics*, the *Odes* of Horace, and the *Psalms*. His original poems are few, but they are among the masterpieces of Spanish lyrical poetry.

See studies by Fitzmaurice-Kelly (1921) and Aubrey Bell (1925); and the *Poesias Originales* (Oxford, 1925).

Ponce de León, JUAN, the discoverer of Florida, was born at San Servas, in Spain, in 1460, was a court page, served against the Moors, and in 1502 sailed with Ovando to Hispaniola, and became governor of the eastern part of the island. In 1510 he obtained the government of Porto Rico, and had conquered the whole island by 1512, when he was deprived of his post. He then, broken in health, set out on a quest for the fountain of perpetual youth, and on Palm Sunday 1513 found Florida, landing a little to the north of where St. Augustine now stands. He secured the appointment of adelantado of the country, and, after staying on his way back to drive the Caribs out of Porto Rico, he returned in 1521 to conquer his new subjects; in this, however, he failed, and lost nearly all his followers. He retired to Cuba, and died there in July from the wound of a poisoned arrow.

Poncho, an important article of male attire in Chile, the Argentine Republic, and some other parts of South America (see GAUCHOS). It consists of a piece of woollen or alpaca cloth, 5 to 7 feet long, 3 to 4 feet broad, having in the middle a slit through which the wearer passes his head, so that the poncho rests upon the shoulders and hangs down before and behind.

Pond, JOHN, was born in London in 1767, studied at Cambridge, and succeeded Maskelyne as astronomer-royal in 1811. His name is identified with numerous improvements in the methods and instruments of observation; he translated Laplace's *Système*, and published a star catalogue and many valuable papers. He died 7th September 1836.

Pondicherry (Fr. *Pondichéry*), the chief of the French settlements in India, situated on the Coromandel Coast, 83 miles S. by W. of Madras City, is divided into two parts by a canal, White (European) town being next the sea. It has handsome streets, a government house, a college, a lighthouse, and cotton-mills. Pop. 47,000. It exports chiefly oil-seeds. The French colony of Pondicherry has an area of 115 sq. m. and a pop. of 174,000. The governor of Pondicherry is governor-general of the French possessions in India. The French first settled here in 1674. The Dutch took the town in 1693, but restored it to the French in 1697. In 1748 Admiral Boscawen besieged Pondicherry for two months, but was compelled to raise the siege. Eyre Coote, however, took it in 1761, yet it was restored to the French in 1763 with reduced territory. It was taken by the English under Sir Hector Monro in 1778, and given back in 1783. In 1793 the English again repossessed themselves of it, but it was a third time restored to the French by the peace of Amiens; taken again in 1803, and a fourth time restored in 1816.

Pondoland, a district of Kaffraria, on the Natal frontier, 65 miles long by 30 wide, was annexed to Cape Colony in 1884-84. Pop. about 265,000.

Pond-weed. See AQUATIC PLANTS, ANACHARIS, POTAMOGETON.

Pongwe. See PUNGWE.

Poniatowski, a princely family of Poland. STANISLAS (1677-1762) joined Charles XII. of Sweden in supporting Stanislas Leszczynski, and was the chief instrument in saving the Swedish king at Pultowa. He held his administrative offices under Augustus II. and Augustus III.—His son STANISLAS AUGUSTUS (1732-98) was the last king of Poland (q.v.).—JOSEPH ANTONY, son of Andrew, brother of king Stanislas Augustus, was commander of the Polish legion in the army of Napoleon. He was born at Warsaw, 7th May 1762, and trained in the Austrian army. In 1789 the Polish Assembly appointed him commander-in-chief of the army of the south, with which he gained brilliant victories over the Russian invaders (1792); but the convention of Targowice (see POLAND) put an end to the contest in 1793. On the outbreak of the following year he joined the army as a volunteer, but Kosciuszko put him in command of the division charged to defend Warsaw on the north. On its fall he withdrew to Vienna. In 1806 the Prussians evacuated Warsaw before the invasion of the French; and when the duchy of Warsaw was constituted (1807) Poniatowski was appointed minister of war and commander-in-chief for the duchy. In 1809, in the course of the war between Austria and France, he invaded Galicia, after having previously retired before stronger forces. Three years later he joined, with a large body of Poles, the French army in its invasion of Russia, and rendered distinguished service at Smolensk and Borodino, but more especially in the great battle of Leipzig (1813), when he valiantly held his ground on the right wing of the French battle array. Napoleon rewarded him by making him marshal of France. After the battle he was left to cover the retreat of the French army, and, whilst attempting to swim his horse over the river Elster to join the main body of his troops, he perished in its waters, 19th October 1813. His body was recovered, taken to Warsaw, and in 1816 removed to Cracow, and placed beside the ashes of Sobieski and Kosciuszko. See (German) Biography by Boguslawski (Cracow, 1831).

Pont, TIMOTHY (c. 1560-c. 1630), a pioneer in Scottish geography and map-making, was the son of Robert Pont (1524-1606), a celebrated Edinburgh minister. He graduated at St Andrews in 1584, became minister of Dunnet in Caithness (1601), and in 1609 subscribed for 2000 acres of forfeited lands in Ulster. 'He was,' says Bishop Nicholson, 'by nature and education a complete mathematician, and the first projector of a Scotch atlas. To that great purpose he personally surveyed all the several counties and isles of the kingdom; took draughts of 'em upon the spot, and added such cursory observations on the monuments of antiquity and other curiosities as were proper for the furnishing out of future descriptions. He was unhappily surpris'd by death;' but his collections were rescued from destruction and oblivion by Sir John Scott of Scotstarvet, and his maps at last appeared in Blaeu's magnificent *Theatrum Orbis Terrarum* (vol. v. Amst. 1654). See Dobie's *Cunningham's Topographised by Timothy Pont* (1876).

Pontac, an old name for a kind of red Bordeaux wine, from a family owning large vineyards.

Ponta Delgada, the largest town of the Azores (q.v.), in São Miguel; pop. 20,000.

Pont-à-Mousson, a town of France (dept. Meurthe-et-Moselle), on the Moselle, 18 miles SSE. of Metz, with a 13th-c. Gothic church; pop. 14,000.

Pontarlier, a French town (dept. Doubs), 35 miles SE. of Besançon, on the Jura route; pop. 9000.

Pontchartrain, LAKE, in Louisiana, about 5 miles N. of New Orleans, is 40 miles long and 25 wide, and communicates with the Gulf of Mexico.

Pontecorvo, a city of the Italian province of Caserta, on the Garigliano, 37 miles NW. of Capua; pop. 12,000.

Pontederia, a genus of aquatic monocotyledons comprising *P. cordifolia*, in North America, and *P. rotundifolia* in South America. It is the type of the small family of Pontederiaceae, distributed in six genera and a score of species over the tropics. Monochoria serves in India as a vegetable, whilst *Eichhornia azurea* is much cultivated in hot houses for its showy flowers.

Pontefract, or POMFRET, an ancient and not unpleasant market-town in the industrial area of the West Riding of Yorkshire, on an eminence near the influx of the Calder to the Aire, 13 miles SE. of Leeds, 8 E. by N. of Wakefield, and 14 NNW. of Doncaster. It stands on the line of a Roman road, but seems to have arisen round its Norman castle, which, founded about 1076 by Ilbert de Lacy, was the scene of the execution or murder of the Earl of Lancaster (1322), Richard II. (1400), and Earl Rivers (1483), was taken in the Pilgrimage of Grace (1536), and during the Great Rebellion sustained four sieges, being finally dismantled in 1649, after its capture by Lambert. There are two old churches, a town-hall (rebuilt 1796), a market-hall (1860), two secondary schools, and large market-gardens and nurseries, the growing of liquorice for the lozenges called 'Pomfret cakes' being a speciality as old as about 1562. At Ackworth, 3 miles south, is a large Quaker school (1778). The borough, which was chartered by Richard III., lost one of its two members in 1885, the other in 1918. Pop. (1921) 16,790.

Pontevedra, a cathedral town of Spain, capital of a like-named province in Galicia, on a bay 30 miles S. of Santiago; pop. 27,000.

Pontiac, capital of Oakland county, Michigan, on Clinton River, surrounded by many small and beautiful lakes, 26 miles NNW. of Detroit, with a large asylum for the insane; pop. 34,000.

Pontiac, chief of the Ottawa Indians, in 1746 defended Detroit for the French, and was said to have led his warriors at Braddock's defeat in 1755. After the French had surrendered Canada, his hatred of the English prompted him to organise an Indian conspiracy to exterminate 'those dogs dressed in red.' In 1763 eight garrisons were massacred; but at Detroit, where Pontiac led in person, the commander was forewarned, and a five months' siege ensued. Peace was made in 1766. Pontiac was murdered in 1769 by a Kaskaskia Indian. See Parkman's *Conspiracy of Pontiac* (1851).

Pontianak, capital of the western division of Dutch Borneo, on the equator, near the mouth of river Kapuas; pop. 30,000.

Pontifex, a member of the sacred college which in ancient Rome had supreme authority in all that concerned religion. Under the monarchy they were the legal advisers of the king as to the duties of the people to the recognised gods of the state, and under the republic took over the whole responsibility. They were not attached to the service of any one particular deity. From their decrees there was no appeal. Their number gradually increased from three to fifteen, including their chief or *pontifex maximus*, and they held office for life. The *pontifex maximus* (the others acting as his council) controlled (but did not perform) sacrifices and ceremonials, consecrated temples, regulated the calendar, ad-

ministered the law as to burials and graveyards, and had control of adoption and of some parts of the marriage law. The college had charge of the state archives and lists of magistrates, and kept records of the events of the year (*annales*) as well as of their own proceedings. Originally co-opted, they were ultimately chosen by a form of popular election. Associated with them were the *Flamines* (q.v.) and Vestal Virgins (q.v.), who were chosen by the *pontifex maximus*. The name—once assumed to be from *pons* and *facere*, and in some way associated with bridges—may be from an Oscan-Umbrian word *puntis*, 'propitiatory offering,' assimilated to *pons*, *pontis*. Julius Caesar was *pontifex maximus* for the last twenty years of his life, and after Augustus the office was held by the emperor *ex officio* till Theodosius finally resigned it. Later the title of *pontifex maximus* naturally passed to the popes, all bishops coming to be called *pontifices*.

Pontifical, one of the service-books of the Church of Rome, in which are contained the services in which the bishop or a priest delegated by the bishop officiates, with rules for the ceremonial to be observed. That which is now in universal use throughout the Western Church is the *Pontificale Romanum* of 1485, as revised under Clement VIII. in 1596. It contains the services for ordinations, for religious professions and receptions of monks and nuns, consecrations, benedictions, as well as of the solemn administration by a bishop of those sacraments which are ordinarily administered by priests.

Pontigny, a village of the French department of Yonne, 18 miles S.E. of Auxerre, with a famous 12th century Cistercian monastery, devastated by the Huguenots in 1567, and finally destroyed at the Revolution; but the church (mainly 1150-70) is the most perfect Cistercian church in existence. Hither three English archbishops retired—Becket, Langton, and St Edmund, the last being buried here.

Pontine Marshes, the southern part of the Campagna of Rome, extending S.E. from Velletri to the sea at Terracina, but separated from the sea by sand-dunes. Many attempts have been made to drain these marshes, from that of Appius Claudius (312 B.C.) till a law of 1899 provided for reclamation in twenty-four years.

Pontoon, a buoyant vessel used in military operations for supporting a temporary bridge (see BRIDGE); and for pontoons in connection with floating docks, see DOCKS.

Pontoppidan, ERIC (1698 1764), born at Aarhus, was professor of Theology at Copenhagen, and from 1747 bishop of Bergen in Norway. He wrote on Danish history and topography and antiquities, and a *Natural History of Norway* (trans. 1755), containing accounts of the kraken, the sea-serpent, and other marvels.

Pontoppidan, HENRIK, Danish novelist, was born 24th July 1857, at his father's parsonage in Fredericia, and studied at Copenhagen. From short tales he passed to novels of great length, culminating in *Lykke Per* (1898 *et seq.*) He was awarded a Nobel prize in 1917.

Pontresina, a tourist centre of the Swiss canton of Grisons, in the Upper Engadine.

Pontus, a country in the north-east of Asia Minor, bordering on the Pontus Euxinus (whence its name), and extending from the Halys to Colchis and Armenia, and southward to the Anti-Taurus. It was long governed by Persian satraps, one of whom, Ariobarzanes, in the 4th century B.C., laid the foundations of an independent sovereignty. One of his successors (see MITHRADATES), one of

the most formidable enemies that Rome ever encountered in the east, was overthrown by Pompey (65 B.C.), and in 63 A.D. Pontus constituted two Roman provinces. On the coast there had long been Greek colonies—Sinope, Cerasus, Trapezus amongst them.

Pontypool, an urban district of Monmouthshire, 9 miles N. by W. of Newport, with collieries, iron and tinplate works, and markets; pop. 6900.

Pontypridd, a town of Glamorgan, at the junction of the Rhondda and Taff valleys, 12 miles NW. of Cardiff, with a famous bridge, and coal mines; pop. 47,200.

Pood. See PUD.

Poodle, a breed of dog almost unknown in Britain until the beginning of the 19th century. From his great intelligence and cleverness in learning tricks, he was generally adopted as a circus or 'trick dog'; but on the Continent the large variety of poodle had long been the hunter sportsman's companion, as he combines the properties of a land and a water dog. Poodles have been loosely divided into the large and small varieties, or the corded-coated and fleecy-coated varieties, as also into black Russian and white German poodles. The large black Russian poodle is much the most handsome and agile specimen of the race, and may be easily trained to retrieve. The small white poodle is only fit for a house dog, but is extremely

Black Corded Poodle.
(From a Photograph by Gamber Bolton, F.Z.S.)

clever and apt. For some unknown reason the poodle has usually been clipped in a peculiar manner; with the exception of a few tufts, his body and hindquarters are shaved entirely bare, while the coat on his shoulders sometimes grows to an enormous length. On the Continent the poodle is humanely left with his natural coat during the winter.

Pool, a game played on a billiard-table. Any number may play. Each is provided with a ball of distinctive colour (taken at random from a pool-basket), with which he tries to pocket the balls of the other players in a certain order (white, red, yellow, &c.); each player contributing an agreed sum, the whole of which falls to the winner at the end of the game. The American game is played with balls numbered 1 to 15, and the number of each ball a player pockets is added to his score. See also PYRAMIDS.

Poole, a seaport of Dorsetshire, 5 miles W. of Bournemouth and 30 E. of Dorchester. It stands on the north side of Poole Harbour (7 by 4½ miles), an irregular inlet, formed by the projection of the

'isle' of Purbeck, with four tides a day. On Brownsea or Branksea Island, just within the narrow entrance to the harbour, is a castle of Henry VIII.'s time. Poole has an old town-hall (1572), a guild-hall (1761), a town-house (1822), considerable shipping, some yacht-building, and a large trade in clays, tiles, and pottery. The men of Poole were great fighters by land and sea, as buccaneers, smugglers, and Cromwellian soldiery. Till 1867 the borough returned two members, and then till 1885 one. Pop. 44,000.

Poole, JOHN (c. 1786-1872), wrote the immortal *Paul Pry*, first produced at the Haymarket in 1825, and several other farces and comedies, also the satirical *Little Piddington* (1839), and other books of a light, humorous kind.

Poole (or POLE), MATTHEW (1624-79), born at York, and educated at Emmanuel College, Cambridge, held a London rectory from 1648 till the passing of the Act of Uniformity (1662), when he retired to Holland. In his *Synopsis Criticorum Biblicorum* (5 vols. fol. 1669-76) the opinions of 150 biblical critics were summarised. The *Annotations on the Holy Bible* were completed by his friends (2 vols. fol. 1685). He also wrote on the Romish controversy.

Poole, REGINALD STUART (1832-95), lived some years in Cairo with his uncle, E. W. Lane, and became keeper of arms and medals in the British Museum, and professor of Archaeology at University College. He wrote on matters Egyptian and numismatics. His nephews, STANLEY LANE POOLE (b. 1854), professor of Arabic in Trinity College, Dublin (1898-1904), and REGINALD LANE POOLE (b. 1857), lecturer on diplomacies at Oxford, and keeper of the Bodleian (1914), are well-known authors.

Poole, WILLIAM FREDERICK (1821-94), born at Salem, Mass., as a student at Yale prepared an index to periodical literature, which was greatly extended in 1853 and again in 1882, supplements from time to time increasing its value. He died librarian at Chicago.

Poona, or PUNA, a town of British India, 119 miles by rail SE. of Bombay, is the military capital of the Deccan and the seat of the government of the presidency during the last half of the year. Under the peshwas the city was the capital of the Marhatta princes and power; it was occupied and annexed by the British in 1818. Here have been built the Deccan College, colleges of science and agriculture, a technical school, and other educational establishments. The Europeans live chiefly at the cantonments, north-west of the city. Jewellery and brass-work, cotton, paper, and mineral waters are manufactured. In 1897 and later Poona was severely visited by plague. Pop. (1851) 73,209; (1911) 158,856; (1921) 214,796.

Poon-wood, the timber of *Calophyllum Inophyllum* and other Indian species of the genus. Poon-oil is expressed from the seeds.

Poor Clares. See CLARE (ST.).

Poor-law. THE BRITISH EMPIRE—*England and Wales.*—The responsibility of the state for its destitute citizens has been recognised in England by three centuries of legislation. The system of poor-law relief as at present in force had its genesis in the often-quoted provisions of the Poor Relief Act of 1601 (43 Eliz., chap. 2). This law was originally temporary, but was made perpetual in 1641. To a certain extent it embodied the experience gained through administration of previous acts of the Tudor period designed to suppress vagabondage and mendicancy. Its object was to compel the provision of work for unemployed able-bodied adults 'having no means to maintain

them,' and of maintenance for the aged and incapacitated poor, and to provide for the apprenticing of the children of such persons, through the agency of the parochial authorities and the magistrates. A new executive officer was created, styled overseer of the poor, who, with the churchwardens, was to administer relief. For refractory persons, houses of correction had been required by 18 Eliz., chap. 3, to be erected. The Settlement Act (14 Car. II., chap. 12) almost destroyed all fluidity of labour by empowering parochial officials to send immigrant labourers back to their last place of settlement within forty days from their coming into the parish. The 9 Geo. I., chap. 7, passed in 1722, empowered parochial authorities to erect houses in which to maintain their paupers, and introduced the principle of the workhouse test by enacting that 'no poor who refused to be lodged and kept in such houses should be entitled to parochial relief.' Gilbert's Act (22 Geo. III., chap. 83) of 1782, however, ordered that the able-bodied should be found employment near their own homes, and that only the aged and incapacitated and orphans should be placed in poor-houses. In 1796 the act of 1722 was repealed.

During the half-century following the passing of Gilbert's Act, the various abuses crept in which were afterwards brought to light by the Royal Commission of 1832. The expenditure in poor relief rose from £2,000,000 in 1785 to £7,870,000 in 1818. Not only did the rates in many parishes approximate to 20s. in the pound, but the labouring classes were demoralised by a system of out-relief, originated in 1795 by the justices of Speenhamland (now part of Newbury in Berkshire), and subsequently widely copied. Under this system wages were supplemented from the rates, and in a way which put the industrious and the idle on a common level. The Royal Commission urged a return to a sounder policy by enouncing as the guiding principle of reform that the situation of the (able-bodied) pauper should not be made on the whole 'really or apparently so eligible as the situation of the independent labourer of the lowest class.'

The recommendations of the Royal Commission were partially embodied in the Poor-law Amendment Act of 1834 (4 and 5 Wm. IV., chap. 76). The principle of central control over the action of the local authorities was for the first time reduced to practice by the creation of a special government department. This statute, as modified and extended by numerous later acts, and elaborated in a host of administrative orders, constitutes the present law of public assistance, of which the General Consolidated Order of 24th July 1847 is the chief summary.

This law is carried into effect by Boards of Guardians elected *ad hoc* by household suffrage of both sexes in groups of parishes styled unions. Overseers (see PARISH) are still appointed, but their duties as to poor-relief are nominal. Populous parishes have each their own board. Till 1894 a certain proportion of the guardians held office *ex officio*, the remainder being elected by the rate-payers and owners, the voting power of each voter rising with his property qualification. Since that date all have been elected on the wider franchise. They meet weekly or fortnightly to supervise the management of the establishments belonging to them, and to decide applications for relief. They have the assistance of a salaried staff, consisting of the clerk to the guardians, who discharges the functions of legal adviser and secretary; the master and matron of the workhouse; the relieving officers, who inquire into applications and dispense out-relief; medical officers for indoor and out paupers; a nursing and sometimes a teaching staff; and

minor officers, such as porters, labour-masters, and dispensers. Responsibility for the consequences of withholding or delaying out-relief, enforceable by criminal proceedings, rests with the relieving officer, even when in so doing he carries out the instructions of his board. A Board of Guardians which refuses relief may be compelled by writ of *mandamus* to justify its action in court. On the other hand, relief improperly granted may be surcharged against the guardians or their officer; and by act of 1926 the Minister of Health is empowered to supersede a defaulting Board of Guardians, e.g. a board insolvent, or threatening to become insolvent, on account of an alleged extravagant administration of out-relief.

Inefficiency and maladministration by the guardians is, to a great extent, checked by the supervision of the Ministry, or Board, of Health, formerly the Local Government Board (hereafter called the central authority), exercised through a staff of inspectors who attend the meetings of the guardians and visit the establishments in their charge. Its powers of control are large.

The policy has long been adopted of protecting the children of pauper parents from being contaminated in character or injured in their future prospects by any taint of pauperism. This principle, already recognised in a statute of 1844 enabling unions to combine to erect district schools apart from the workhouse, was put slowly into practice. Official inquiries have, however, since disclosed disadvantages in massing large numbers of children in big institutions. One of these had accommodation for 2000 inmates. Three alternatives have been introduced: to place children in groups of ten to twenty in scattered homes within the town, or, secondly, outside the town in cottage homes, in both cases under a foster-mother; to board children out among carefully selected cottagers under conditions prescribed by the Boarding Out Order, 1911. Only orphans, deserted children, and children to whom the guardians stand *in loco parentis* may be thus boarded out. They are supervised either by a committee appointed by the guardians or by an independent committee approved by the central authority. At least one member must be a woman. With lapse of time the type of smaller home was found to possess defects of its own. As between this type and the so-called 'harrack' schools, according to a Board of Education report of 1908, 'the success of the school depends almost entirely on the character of the supervision and the *personnel* of the staff.' A few blind and other defective children can be placed in special schools. A proportion of orphan and deserted children are emigrated to Canada.

The sick may be treated in institutions belonging to or utilised by the guardians, or in their own homes, according to their circumstances and the nature of the malady. The accommodation provided for in-patients may be either a sick-ward in the workhouse building itself, or a building adjacent to, but distinct from, the workhouse, or an infirmary entirely separated from other poor-law establishments, and occasionally the joint property of several unions. Trained nurses are now usually employed, and infirmaries of the latter type are generally equipped as modern hospitals. Persons of a higher class than would enter the sick or ordinary wards of a workhouse are said frequently to avail themselves of them. Patients suffering from serious infectious disorders are usually removed, whether indigent or not, to isolation hospitals, which, though supported from the rates and managed by committees on which the guardians are represented, are not poor-law institutions. So with county lunatic asylums, to which both pauper and non-pauper insane are committed. The hospi-

tals are under the sanitary, the asylums under the county and municipal, authorities.

The medical men in charge of large separate infirmaries usually give their whole time. Those who attend the poor at home are generally in private practice. The latter are termed district medical officers. They have power to order medicines, and to recommend special diet to be granted by the guardians, or, in emergencies, by the relieving officer. In London and other large towns dispensaries have been opened under the charge of the district medical officers. The effect of the National Insurance Act (1 and 2 Geo. V., chap. 55), which came into force on 15th July 1912 (see INSURANCE), has been greatly to modify this department of the poor-law system.

The Poor Law Institutions Order, 1913, was designed to consolidate the regulations governing indoor relief. Admission to the workhouse is granted on the written order of the guardians or by a provisional order of the overseers or relieving officer. In urgent cases the master or warden can admit without an order. Except in cases of sickness, accident, or infirmity affecting himself or one of his family, institutional relief is only to be granted, as a general rule, to an applicant together with his dependants. (See below on out-relief.) Separate quarters are required to be provided for the infirm and the able-bodied above the age of fifteen of both sexes, for boys between seven and fifteen, for girls of the same age, and for younger children. The last-mentioned, however, may be placed in the women's quarters; and married couples are allowed to live together if either of them is over sixty or not able-bodied, a privilege not always appreciated. Further classification of the old according to character is effected in some workhouses. An inmate may leave the workhouse at any time on giving notice. Generally twenty-four hours suffices; but inmates in the habit of leaving and returning at short intervals may be required to give up to seven days' notice. Such 'ins and outs' are partly responsible for the large number of children temporarily retained in workhouses. The head of a family is required to take his dependants with him (or her) on leaving, and the difficulty of moving children to or from separate establishments is obvious.

Special dietary and other privileges are conceded to old inmates of superior character in many unions. For loafers and the able-bodied of bad character special test workhouses have in a very few localities been set apart, where more rigorous discipline is enforced. Great differences prevail locally in the arrangements made for keeping able-bodied male inmates occupied. In some instances they are engaged in making articles or raising vegetables required in the establishments of the union, but in others they are practically unemployed. A more liberal diet, but no cash remuneration, is sometimes allowed the more industrious. Female inmates are engaged in the laundry and other household work of the institution. There is no generally accepted definition of the term 'able-bodied,' and many included under it are unfit for an average day's work. Indoor paupers so classed are practically those to whom the medical officer assigns what is termed 'able-bodied diet.'

The Relief Regulation Order of 28th December 1911, superseding the Outdoor Relief Prohibition and Regulation Orders of 1844 and 1852, codifies the rules of the central authority regarding domiciliary relief. Certain restrictions are imposed upon granting assistance in this form to men or single women in health. But, on the ground of 'special circumstances,' a Board of Guardians may temporarily give out-relief to the family of a man in the workhouse, or to a man himself when set to work and kept employed by the guardians. These

alternatives had been sanctioned by previous orders, and have been generally known as the Modified Workhouse Test and the Labour Test respectively. Relief given under the latter order must be half in kind. Guardians exercising this power must notify the central authority of the circumstances attending their action. The measure was intended to provide a test of destitution alternative to the workhouse whenever, owing to exceptional causes, that institution could receive no more inmates. The task set has usually been stone-breaking, but has occasionally taken other forms, as reclaiming waste land. In some unions a labour-yard has formed one of the permanent establishments of the guardians. Now, however, the class whom the authors of the order of 1844 had in view has been, to a very large extent, provided for by voluntary means or, more recently, through relief-works provided under the Unemployed Workmen Act of 1905 (5 Edw. VII., chap. 18). Relief may not be given to men on strike so long as they are physically fit to work, but may be given to their wives and children when destitute, in which case the men are liable to prosecution for neglecting their families. The Children Act (8 Edw. VII., chap. 67) makes it a penal offence for a parent to abstain from applying for relief if he cannot otherwise supply his child with adequate necessities, including medical aid.

The Relief (School Children) Order of 1905, left intact by the Relief Regulation Order of 1911, authorises school managers to apply for out-relief for any child attending their school in want of sufficient nourishment, whose father is not already in receipt of poor-law relief. This is the sole case in which relief may be given without an application from the recipient. The National Insurance Act of 1911 (1 and 2 Geo. V., chap. 55, sec. 109) provided that, in fixing the amount of out-relief to be granted to a person in receipt of benefit under the act, guardians should not take into consideration such benefit except in so far as it exceeded 5s. a week; and by the National Health Insurance Act of 1924 (14 and 15 Geo. V., chap. 38, sec. 105.1) the figure was raised to 7s. 6d. A similar provision is made regarding members of friendly societies. The history of every application for relief of any kind must be preserved on a form styled a 'case-paper.'

Vagrants and tramps form a distinct class of pauper, for whom separate treatment is prescribed. They must be lodged apart from other inmates of the workhouse, or in distinct buildings known as casual wards. They must remain at least one clear day, and must complete a stint of work before leaving. Their diet is scantier than that of other inmates. The guardians have power to lengthen the detention of habitués. Paupers who are lunatic or idiot may be detained in workhouses, provided a magistrate is satisfied on medical evidence, including the workhouse medical officer's certificate, that separate accommodation is provided for them, or that they can mix with the other inmates without inconvenience. Acute cases are placed in county or borough asylums for the insane. All lunatics found wandering or not under proper care must be brought, irrespective of the question of means, by the police or the relieving officer before a magistrate, to be dealt with according to medical evidence. As a rule the district medical officer's certificate is necessary.

In the view of the reformers of 1834, official relief was designed for the destitute only, and of the genuineness of the destitution admission to the workhouse was to be the test, at least wherever the applicant was able to work. For the impotent or unable to work, the system of out-relief was continued where necessary. The central authority

has pointed out that a person may be destitute in some particular—e.g. medical treatment—'without being destitute in all respects.' Where a family is admitted into the workhouse, it is in the discretion of the guardians to store their household effects in order that they may have them on leaving the house. The right of guardians to recover cost of relief from a pauper or those legally liable for his maintenance is regulated by 12 and 13 Vict., chap. 103, and several subsequent statutes. There is also a common-law right to recover six years' maintenance. Receipt of relief formerly entailed parliamentary and local disenfranchisement during its receipt and thereafter within the registration year, but in 1885 the disqualification, so far as relief ordered by the medical officer was concerned, was removed by 48 and 49 Vict., chap. 46, and in 1918 was completely done away by 8 Geo. V., chap. 64, except in the case of persons actually inmates of a poor-law institution at the time of an election. The introduction by the Act of Settlement, already referred to, of the principle of removability became the cause of great hardship to the labouring class, and of vast litigation and expense to parochial authorities. The law on the subject is still highly complicated, but it now recognises that a person is to be relieved in the place where he becomes destitute, and at the cost of that union, if (*inter alia*) he be legally settled there or have resided within the union for a complete year without break, or if his destitution result from accident or temporary sickness. The qualifications conferring settlement are too numerous to be set forth here, but three years' residence is one of these. The Royal Commission reporting in 1909 expressed the opinion that settlement in its present form 'neither restricts the mobility of labour, nor makes it more difficult for the poor to find houses in their union.' The cost of relief is met by a rate levied on owners of real property and occupiers of land and buildings of every description, whether for purposes of residence or business (see RATES). The effect of the Old Age Pensions Acts, especially following the removal in 1911 of the pauper disqualification, was greatly to reduce the number of old persons in receipt of poor-relief.

Scotland.—The Poor-law Act of 1834 relates to England and Wales alone. In Scotland the principles as well as the machinery of official relief differ in some important respects from those adopted in England. The principal act relating to Scotland is the 8 and 9 Vict., chap. 83. Previous to the passing of this act in 1845 the poor in most parishes were supported out of voluntary collections at the parish church, administered by the heritors and kirk-session; parishes if they chose might levy a tax, but up to 1845 no poor-rate had been levied over the whole of Scotland. In Scotland no claim on the part of the able-bodied to relief of any kind, even on behalf of a sick dependant, is recognised in law, though to a considerable but varying extent it is in practice. No special provision is made for homeless persons or vagrants. Since 1894 the local relief authority has been the Parish Council. The assessment for cost of relief is divided equally between owners and occupiers of lands and buildings. The erection of a poorhouse is discretionary. Parishes having a less population than 5000 can only erect a poorhouse in combination with other parishes. The Parish Council adjudicates on applications for relief upon the report of the inspector of the poor, an official who combines the functions of clerk to the guardians and relieving officer. Bodily or mental inability to earn a subsistence is in law a condition precedent to relief. It is sometimes disregarded in practice. An in-pauper, when certified by the medical officer as in good health, is liable to be

discharged. The inspector has power to refuse relief, but must in that case give the applicant a certificate stating the grounds of refusal. The applicant may appeal against such a refusal to the sheriff, or against inadequate relief to the central authority.

Ireland.—Different systems obtain in Northern Ireland and in the Irish Free State. Previous to its break up as a single legislative unit the principal poor law enactment affecting Ireland was that of 1838. It established Boards of Guardians and was modelled on the English act, though differing in details. Only indoor-relief was to be given. This prohibition, however, was later relaxed, the position coming to be that out-relief might not be given to occupiers of land or to able-bodied men, and this restriction itself was liable to suspension in times of exceptional distress. In Northern Ireland the system continues along these lines, but in the Irish Free State the inauguration of a county system of administration involved the disappearance of Boards of Guardians and the vesting of control in county councils and committees thereof, as also the abolition of union workhouses and the establishment of county homes and county hospitals.

Royal Commission of 1905-9.—On 14 December 1905 a royal warrant was issued appointing a commission of inquiry into the poor-laws and relief of distress in the United Kingdom. A vast amount of evidence was collected, and in 1909 a majority and a minority report were presented.

The Majority Report proposed that the existing Boards of Guardians should be abolished and that in each county or county-borough a new body (Public Assistance Authority) should be established, assisted by local committees and by voluntary aid committees, the second designed to procure co-operation with local and private charities; that one uniform order regarding out-relief should apply to the entire country, and that voluntary agencies should be utilised for the care of individual cases; that out-relief to the able-bodied should not be prohibited, but regulated according to special conditions; that general workhouses should be abolished, and that separate institutions should be set apart for (1) children, (2) aged and infirm, (3) sick, (4) able-bodied men, (5) able-bodied women, (6) vagrants, (7) feeble-minded and epileptics; that the authority should possess powers of removal to and detention in institutions, and should establish labour and detention colonies for the able-bodied and unemployed; that medical assistance should be reorganised on a provident basis with the aim that all preventive and curative methods approved by science and reasonably accessible to the citizen of average means should be 'obtainable by his poorer neighbour upon payment of a contribution according to his means, and . . . available for the very poor without any payment'; that inability to earn a livelihood should cease to be a condition of relief in Scotland. Stress was laid also upon making the administration of relief of educational value in strengthening the moral fibre of those relieved. The proposals relating to unemployment, that a national system of labour bureaux should be established and that a scheme of government unemployment insurance should be instituted, passed into legislation in the Labour Exchanges Act of 1909 (see LABOUR) and in the unemployment insurance measures of 1912 and of 1920 (see INSURANCE).

The Minority Report agreed with the Majority in advocating the transference of the functions now entrusted to the Boards of Guardians, so far as they concerned the non-able-bodied, to the county and county-borough councils, but differed from it in recommending the apportionment of such functions among the existing committees (education, health,

asylums, pensions) of the councils instead of the creation of a new department, the work of the committees to be supervised by the appropriate national government departments. The measures proposed for dealing with the destitution of the able-bodied included the appointment of a Ministry of Labour (such a ministry was established in 1917), whose chief should be responsible to parliament for organising the labour-market so as to minimise unemployment. This department should manage a network of labour exchanges, should subsidise trade union and other societies giving out-of-work benefit (government insurance against unemployment being rejected in view of its probable adverse effects on trade unions), and maintain labour colonies and day training depôts, where able-bodied men applying for assistance might, without disfranchisement, receive 'such varied beneficial training of body and mind as they proved capable of' while their families received domiciliary relief, and also detention colonies for the refractory. To ensure greater continuity of employment, the Board of Agriculture should put into operation during periods of slackness schemes of afforestation, coast protection, and land reclamation at an outlay not below an average of £40,000,000 per decade.

The keynote of the Majority Report was the unification of the administration of public relief on certain main lines that would tend to further independence and self-maintenance among those assisted. That of the Minority Report was to divide and departmentalise the administration of relief with a view to ensuring 'a national minimum of efficiency.' One would deal with those who make application; the other would seek out and relieve those who do not. No fundamental changes in the poor-law system resulted immediately from either of the reports, but the poor-law orders of 1911 and of 1913 mentioned above introduced minor administrative reforms.

The Local Government Committee of the Ministry of Reconstruction issued an important report ('Maclean Report') in 1918, endorsing the principles advocated in 1909 by the Royal Commission. The committee included representatives of both majority and minority of the Royal Commission, and officials of the Local Government Board. It recommended not merely the abolition of the workhouse and the Board of Guardians, but the sweeping away of the whole existing system of poor-law; and legislation was promised along these lines, later definitely for 1927. In 1919 the Local Government Boards were superseded by the Ministry of Health and Board of Health.

The Dominions.—Throughout French-speaking Canada and the greater part of Australasia public relief has taken the form of state subsidies towards private charities, and has not become the concern of local authorities except to a limited extent in New Zealand. A claim to relief on the ground of destitution alone is not recognised. Nova Scotia and New Brunswick retain the English localised system under overseers. Ontario blends the recognition of local liability with a system of subsidised charity. The newer provinces of the dominion tend to adopt United States methods. Generally speaking, children and the aged are the principal objects of relief. Indoor medical aid consists in subsidies to voluntary hospitals. There appears to be no public system of domiciliary relief except in Ontario. An old age pension system operates in Australasia independently of the poor-law.

FOREIGN COUNTRIES.—The highly involved question of settlement can only arise where responsibility for relief is localised. In the British colonies, where official relief is either centralised or unorganised, it hardly exists. Settlement may

usually be acquired either by birth, residence, or, in the case of females, by marriage. The qualifying term of residence lies between one month, as in some of the United States, and five years, as in Denmark or Italy. The principle that destitution, when relievable, is to be immediately relieved at the spot where it occurs, regardless of settlement, is recognised in France and Germany, and in most of western and central Europe. The chief points of difference arise with regard to removability and chargeability. The laws of the New England states are especially rigid on these points. The liability of relatives to contribute is generally enforceable wherever the system of relief rests on local obligation. There is power to recover the cost of relief, when the pauper is in a position to pay, in France, Austria, Holland, and Denmark, but not in Belgium or Germany.

Austria.—The right to public relief is recognised by law of 1863. The administration is in the hands of the communal authorities in the first instance, and those wholly or partially unfit for work may be provided for in such manner as the commune judges propose. Besides poorhouses and out-relief, the practice exists in certain provinces of quartering paupers on householders in fixed succession. Funds for poor-relief are derived from endowments, voluntary contributions, the third of the property left by intestate secular priests, certain percentages on the proceeds of voluntary sales, and in some provinces from hunting licences, dog certificates, theatre money, and in some large towns from percentages on legacies over a fixed amount. By act of 1920 unemployment insurance was introduced.

Belgium.—A law of 1891 enacts that 'public relief shall be furnished to poor persons by the commune.' Every communal council is made responsible for the existence of a *Bureau de Bienfaisance*, or committee for furnishing out-relief, within its jurisdiction. Another committee is formed for the management of hospices and other institutions in communes where such establishments exist. Neglected children and juvenile offenders are placed in state schools styled *Écoles de Bienfaisance*. The relief of the aged indigent rests with the *Bureau de Bienfaisance* and the committees of the hospices. Vagrants and, to a certain extent, the able-bodied poor are dealt with by the police. Habitual vagrants or drunkards are committed to the penal colonies at Merselas and elsewhere, styled *Dépôts de Mendicité*, for a term of years.

Denmark.—The poor-law of 1891 affirms the duty of the relief authority to provide the destitute with necessities, and when sick with suitable treatment. The communal authority is the relief authority. Exclusive of municipalities, few communes possess institutions. In the towns there are almshouses (*fattighuus*) for the more respectable paupers, and penal workhouses (*tvangsarbejdsanstalten*) for vagrants and bad characters. Children are almost universally boarded out, and, by law of 1913, assistance is granted to children living with their widowed mothers. Poor-law institutions include very small infirmary accommodation. Hospitals are provided by charity and by municipalities, the cost not being included in poor-relief expenditure. An old age pensions system is in being. It is controlled by law of 1922, which in 1923 displaced the original law of 1891. The assistance granted may be in money, or in kind, or by residence in hospital.

France.—A general right to relief from the state is not recognised, except with regard to certain categories of indigents which have steadily increased in number and comprehensiveness from the date of the Directory till now. The principal

relief authorities are the *Direction de l'Assistance et de l'Hygiène publique* (aided by the *Conseil Supérieur de l'Assistance*, an advisory body of experts), corresponding to the Ministry of Health in England; the prefect and *Conseil Général* of the department, corresponding to the County Council in England; the mayor and council of the commune. Under the communal council are the *Bureau d'Assistance* for relief in sickness or old age, and the *Bureau de Bienfaisance* for out-relief in ordinary cases for which obligatory provision has not been made. The *Bureaux de Bienfaisance* are quasi-independent charitable bodies enjoying a certain legal status. Relief is obligatory upon the authorities, though not enforceable by the applicant, as regards (1) orphan, deserted, and neglected children; (2) widows, single, or divorced women burdened with children whom they cannot support; (3) the sick; (4) persons above the age of sixteen suffering from infirmity or incurable disease; (5) persons above the age of sixty-five; and (6) the insane. The law on the subject of child-relief was consolidated by an act of 1904. Children may be taken over either permanently or temporarily. When permanently adopted, they are usually boarded out in rural districts, and apprenticed at the age of thirteen to some agricultural occupation under inspectorial supervision. Institutional care is avoided unless it is necessitated by the health or bad character of the child. On the other hand, if the mother is living and the home surroundings are satisfactory, she is granted out-relief for the child's support. No distinction is made between legitimate and illegitimate children. Medical relief, obligatory under a law of 1893, is dispensed through the *Bureau d'Assistance*, which draw up annual lists of persons 'who ought in the event of sickness to be admitted to free medical relief.' Domiciliary relief is preferred, whenever practicable, to hospital treatment. Paris and over 500 other towns, termed *communes autonomes*, are exempt from the general system. The cost of maintaining the insane poor is divided between the departments and the communes. The organisation of relief for the aged and infirm is on lines similar to that of free medical relief. Lists are drawn up and the benefit of the law is not confined to the destitute. An applicant may, with his consent, be maintained in a hospice, but out-relief is the rule, allowances varying within fixed limits. An old age pensions law of 1910, amended in 1912, provides for all wage earners old age pensions towards which both employers and workers contribute. The expense of relief is met by local and general taxation, supplemented by the proceeds of certain taxes on amusements specially allocated to this purpose, income from endowments, and gifts and charitable bequests. In Paris the administration of the poor-law is confided to an authority distinct from that of the rest of France, consisting of a director, assisted by a Council of Supervision and a staff of inspectors.

Germany.—The relief of the poor is governed by law of 1924. Under it relief is granted by District Unions (*Bezirksfuersorgeverbände*) or by Provincial and State Unions (*Landesfuersorgeverbände*); in the first are united the larger and smaller municipalities, in the second the provincial or state authorities. Relief is given in the ordinary place of residence of the recipient, usually by the District Union; but where the recipient has no ordinary place of residence the State Union makes the grant. The sick, the infirm, the unemployed, the aged poor are mainly provided for through the state system of insurance, and the burden on the poor-law system is thus lightened. Relief may be made dependent on labour. In most large towns the Elberfeld (q.v.) system of unpaid district almoners

is in force. The mode of raising funds for relief varies among the several states, but as a rule poor-rates are not levied. The cost may be defrayed out of revenues derived from general taxation or from certain fines, fees, and taxes specially allocated to the purpose; and in some localities the income from endowments is also available.

Holland.—Until 1912 public assistance was regulated by law of 1854, which lays down that no communal authority shall give relief until assured that the applicant is unable to obtain it from ecclesiastical or private sources. This law was profoundly modified by enactment of 1912, which decrees that relief is to be granted to those only who cannot provide for themselves, and are assisted neither by churches or charities, nor by persons legally liable for their support. Special provision is made for medical relief. No poor-rate is levied. Mendicity and vagabondage are treated as offences and offenders may be placed in a state-work establishment. There are very few work-houses. Unemployment insurance was introduced in 1916.

Hungary.—The right to public relief is recognised by law of 1886. Administration is mainly communal. In the smaller communes orphans and the indigent are cared for by official guardians and overseers, while in the larger there are poorhouses. The funds are chiefly derived from fines and taxes. The church and charitable societies also provide assistance.

Italy.—A general right to public relief is not expressly recognised by law, which, however, requires local authorities to relieve the sick and children, and also 'persons incapable of work,' if a local charity cannot be required under its constitution to do so. In general public charity is exercised through the permanent charitable foundations known as *opere pie*. Sick-relief is administered on a system similar to that imposed by the law of 1893 in France.

Poland.—After the attainment in 1918 of independence the regulations and institutions of poor-relief in what had been Austrian and Prussian Poland continued as in Austria and in Germany; and in what had been Russian Poland, the care of the poor was by private charity. An act of 1923, however, relating to social welfare as a whole, made general regulations as to poor-relief. Provision was made for children, old persons, invalids, cripples, &c.; a campaign against begging and loitering was undertaken; and a scheme of co-operation with charitable institutions supported by private subscriptions was instituted. In principle the duty of social protection lies with local government; the state, however, covers expenses connected with the welfare of persons towards whom it owes a special duty, and also such expenditure as exceeds the financial capacity of a local government unit. The right to social care appertains to all citizens domiciled in one commune for at least one year. The national Ministry of Labour and Social Welfare (a Council of Social Welfare acts as an advisory body) is in the last instance the controlling authority. An old age pensions scheme, and health, accident, and unemployment insurance schemes are also in operation, most transferred with former Austrian and German territories, the later tendency being to extension and unification.

Russia.—The system existing before the Revolution was inaugurated by the Tsaritsas Catherine II. and Marie, the wife of the Tsar Paul I. The former appointed a Committee of Assistance in each province under the presidency of the governor; the latter founded hospices for children and other establishments. The law imposed on communal and municipal authorities, including the police,

the duty of suppressing mendicity and of setting the able-bodied destitute to work. The efficiency of relief administration varied immensely. In provinces not possessing *Zemstvos* (provincial councils), and in towns below the rank of *chefs lieux*, the organisation of relief was very defective or else non-existent. Among the first acts of the Revolution was one for industrial insurance at the cost of the employer, but in the first phase of communism this was ended, the whole economic system implying the support by the state of the population. The expenditure so involved was ruinously large yet the individual did not receive as much as under the old system, and with the new economic policy a return was made to more usual methods of relief. There are rural relief committees with power to raise a rate; the state does not contribute though to some extent it controls. For all wage-earners there is compulsory contributory social insurance, and for the remainder state relief together with pensions.

Sweden.—According to ordinances of 1918, the communes are obliged to assist children under 16 years of age if their circumstances require it, and all who from age, disease, or physical or mental infirmity are unable to support themselves. Each commune and each town constitutes a poor district and in each is a board of public assistance. These boards possess workhouses and similar establishments, including cottages assigned as pauper dwellings.

United States.—There is no federal poor-law or poor-law system in the United States. Poor-relief is under the control of the individual state. There is great variety in the form of administration. The county system is probably the predominant system. Under it administration is in the hands either of the county committee, or of specially elected county officers, or, more usually, of the board of county commissioners or supervisors, which is the general county authority. In the New England states the township is the unit of administration. In the large cities relief is usually administered by overseers or salaried officers, either appointed by the mayor or Town Council or else elected *ad hoc* by the citizens. An express recognition of the individual claim to relief appears in the legislation of some only of the states—e.g. Connecticut and New York. Supervision over poor-relief is exercised in many states through the State Boards of Charities, and in New York and New Jersey through the State Charities Aid Associations of those states, officially recognised. Out-relief, absolutely prohibited in only a very few areas, is generally much restricted both in amount and in the class of cases eligible for it. In some states, however, the numbers in receipt of out-relief exceed those in institutions. The almshouse, answering to the old English poorhouse, is provided in most of the states. Institutions for the insane and other special classes of defectives are increasing in number, and relieve the almshouses of the burden of defective paupers. A labour test for the able-bodied is common, and vagrants are dealt with penally. Generally speaking, there is no separate organisation of medical relief. In some localities separate hospital wards have been added to the almshouses. Pauper in-patients are, however, very commonly maintained in municipal or private hospitals at the expense of the poor-law authority. The retention of children in almshouses is restricted in many states, and in several, including New York, is prohibited. In some instances the state or county authorities establish institutions for such children; more usually they are maintained at the public expense in private charitable institutions, which in some cases are subjected to state inspection. Large numbers of children are boarded out for payment, or 'placed out' with-

out payment.' This is sometimes done through the agency of Children's Aid Societies, sometimes through officers of the state or poor-law authority, who exercise supervision during the period of boarding out. Indiana and some other states have created Boards of Children's Guardians, which can bring delinquent or neglected children before the courts. The courts then transfer the children from the custody of their parents to that of the board. The funds required by poor-law authorities are in most instances raised by taxation. At the same time, the numbers of poor relieved by private charity, and particularly in charitable institutions, are exceptionally large when compared with charitable activity in other countries.

Popayán, a town in Colombia, in a fertile plain, 5700 feet above sea-level, near the river Cauca, is an archbishop's see, with a college, seminary, and convent; pop. 20,000.

Pope. See RUFFE.

Pope (Gr. *papapas*, Lat. *papa*, 'father'; at first used of all bishops, from the 5th century gradually appropriated in the West to the Bishop of Rome, though still used of priests of the Greek Church), the Bishop of Rome, and supreme pontiff of the Roman Catholic Church. In this article an historic sketch will be given of the papacy as an institution. While the empire remained pagan the history of the bishops of Rome is obscure. Tradition confirmed by the faith of the church represents St Peter as the first Bishop of Rome. His immediate successors must have been recognised by Christians as the heads of Christ's church in the imperial city. Rome, the mistress of the world, was regarded by all men with reverence; all men came thither. So among Christians its bishop held a position of special dignity, and his judgment in ecclesiastical controversies was regarded as weighty. The heresy of Novatian, irregularly ordained Bishop of Rome during the lifetime of Cornelius (251), illustrated the importance of ecclesiastical unity, and so in the end tended to exalt the Bishop of Rome as the visible head of the church.

Under Constantine the empire became Christian, and Rome ceased to be the sole imperial city. The first of these changes vastly increased the dignity of its bishop; the second separated Latin from Eastern Christendom; the heresies of the speculative East found no acceptance in the West; the Bishop of Rome became the champion of orthodoxy, and was recognised by the Council of Sardica (347) as having appellate jurisdiction. Before the end of the 4th century Siricius, in publishing his decretal on clerical celibacy, assumed that the law of the Roman Church was binding everywhere. A great increase in power may be dated from the reign of Innocent I. (402-417), who claimed, as the successor of St Peter, superiority over western Christendom. The weakness of the western empire,

the sack of Rome by the Visigoths, and the reverence which they paid to all things Christian, combined to make Innocent the most powerful person in the Christian city which rose upon the ashes of pagan Rome. Leo I. (440-461) maintained the claim of his see to the patriarchate of the West, while in Rome and Italy his fearlessness and prudence during the invasions of the Huns and Vandals gave him commanding influence. In 476 the empire of the west came to an end; the sole emperor of the Romans reigned at Constantinople. As long as he left Italy alone the papal power was the stronger for his absence. Amid the political disintegration of the West the church remained a stable bond of union; its centre was Rome, and the head of Rome was the pope, who became more and more regarded as the leader and defender of the people. Though Theodoric the Ostrogoth, while master of Italy, abstained from interference with the bishops of Rome until shortly before his death, some trouble arose from disputed elections. The election anciently lay with the clergy and people of the city, but as the interference of the laity led to violence, Symmachus decreed (498) that thenceforward the election should be decided by the votes of the Roman clergy. The reconquest of Italy by the generals of Justinian impaired the papal power, for he treated the pope like a rebellious servant. As the imperial power waned in Italy before the invasion of the Lombards, the pope again became pre-eminent. Neglected by her emperor, Rome found a protector in Gregory the Great (590-604), who was forced by the sufferings of the people to deal with the Lombards as a temporal prince. Yet his work was chiefly spiritual. Under him the right to the patriarchate of the West was firmly established; his holiness, his writings, and his reforms were universally admired; he exercised ecclesiastical discipline over the bishops of other lands, and he resented the indignity put upon his see by the assumption of the title 'Universal Bishop' by the Patriarch of Constantinople. Under him the Arian invaders of Italy, the Lombards, were converted to Catholicism; so, too, were the Arian Visigoths of Spain; while the heathen English first received the gospel from missionaries whom he sent out. Gregory completed the work of Innocent and Leo, and was the greatest of the three founders of the papacy of the middle ages.

During the 7th century the popes were much troubled by the eastern emperors, who were still lords of Rome and some parts of Italy. The emperors caused elections to the papacy to be submitted to themselves for confirmation, tried to force the popes to concur in their heresy concerning the will of Christ, and treated them as mere officers of their state. Martin I. (649-654), a strenuous opponent of the Monothelite heresy, was seized, carried off to Constantinople, and, after suffering ill-usage, died in exile. Even when the emperors again became orthodox they still humiliated the popes. Meanwhile the papal power was growing in western lands: the English turned from Columban usages, and professed obedience to Rome (664); the Burgundians and Frieslanders received the gospel; and early in the 8th century Boniface won over a large part of Germany to the faith, acting on a commission from Gregory II. (715-731). In Gregory's time the Emperor Leo III. forbade the worship and even the use of images throughout his empire, whence he and his successors who adopted the same policy are called Iconoclasts (image-breakers). Gregory refused to obey his decree, and was upheld by the Italians and the West generally. The imperial governor in Italy, called the exarch, sought to compel the pope to obey his master, and the Italians rose in the pope's defence. The Lom-

bards took advantage of the confusion to conquer the exarchate. They threatened the lands of the church; no help was to be had from the emperor; Italy was virtually severed from the empire. In

the Lombards; he won back from them all that had belonged to the exarchate in Northern Italy, and bestowed it on the Roman see (754). This was the beginning of the temporal power of the popes. In return Pepin accepted from the pope the title of Patrician of the Romans, an acknowledgment of his rights in Rome, and of his duty as the defender of the church. He had already received the papal sanction for the deposition of the Frankish king and his own coronation; the pope's action in this matter formed a precedent not forgotten by his successors. Pepin's son, Charles (Charlemagne), again routed the Lombards, and renewed his father's donation. At another visit he declared Leo III. (795-816) guiltless of certain crimes with which he was charged, and on Christmas Day, 800, Leo crowned him emperor. It was contrary to the feelings of the age that the church should lack an imperial protector; the breach with the eastern empire was complete, and the imperial throne at Constantinople was held to be occupied unlawfully. While Leo had allowed his cause to be judged by a temporal prince, and had accepted him as master of Rome and emperor, he had assumed as God's vicar the right to bestow the imperial crown, which carried with it the lordship of the world.

During the struggles that preceded the break-up of the Frankish empire the popes generally favoured the princes of the West (or Gaulish) Franks, rather than of the East (or German) Franks. The rise of separate nations threw political power into the hands of the great churchmen of the new states. The pontificate of Nicolas I. (858-867) was marked by the successful assertion of the authority of Rome in correcting the vices of princes, and compelling the submission of the most powerful prelates of the West, such as the Archbishop of Ravenna, certain German bishops who upheld their king in his evil ways, and even Hincmar of Rheims. His chief weapon against the bishops was a series of early decretals, now known to have been forgeries not emanating from Rome. The lofty policy of Nicolas was pursued, though with less success, by Hadrian II. (867-872). Meanwhile a dispute begun in the time of Nicolas was leading the Greek Church towards schism. During the papacy of John VIII. (872-882) the Saracens established themselves in Southern Italy and threatened Rome, and the courageous pope sought help on all sides against them and his Christian enemies. The anarchy in Italy which followed the extinction of the Carolingian empire had the worst effects on the papacy. Things were darkest in the first half of the 10th century. Competitors for power treated the popes as their tools, and elections to the papacy were decided either by the nobles of Rome, or the mob, or any foreign power which chanced to be master of the city. No reverence was paid to the papal office, and several of those raised to it were men of fierce and unholy lives. Pressed by enemies, John XII. sent for help to Otto the Great, king of Germany, and, by crowning him emperor in 962, revived the empire; he acknowledged Otto as his sovereign, and the Romans swore to elect no pope without the emperor's consent. Though Otto, his son, and his grandson did something towards restoring to the papacy its proper dignity, the attempt to regenerate it failed; and, after the death of Otto III., it was again degraded by falling under the control of the counts of Tusculum.

The emperor Henry III. regenerated the papacy by releasing it from the control of the Roman nobles, and conferring it on German churchmen of high character. One of these, Leo IX. (1049-55), commanded the respect of Christendom by his revival of ecclesiastical discipline. He was taken prisoner when attempting to check the Norman invaders of Italy, but the Normans revered their captive, and after his death acknowledged the pope as the feudal lord of their conquests, Sicily and Southern Italy. Under the guidance of Hildebrand (see GREGORY VII.) the papacy advanced rapidly in power and repute. By a decree of Nicolas II. (1059-61) in 1059 the right of election was vested in the cardinals. After a severe struggle clerical celibacy was enforced, and the clergy thus separated from worldly ties became devoted to the interests of their order and its earthly head. Simony was strictly repressed. A further advance was made when Gregory VII. (1073-86) forbade churchmen to receive investiture of their benefices from lay hands. This touched the sovereignty of lay princes. He was opposed by the Emperor Henry IV. (q.v.). The principle at stake was the church's independence of the lay power, its dependence on its own visible head, and its consequent salvation from feudal bonds and abuses. Gregory asserted the highest claims, and deposed the emperor, who made a humiliating submission at Canossa in 1077. Pope and emperor each found support, the pope in the discontent of the Germans and in the Normans. War broke out, an antipope and rivals to the emperor were set up. The struggle lasted beyond the lives of Gregory and Henry IV., and was decided in 1122 by the Concordat of Worms, which, though a compromise, was a substantial victory for the papacy. During the struggle the Crusades brought a vast increase of power to the pope, for they made him the head of Christendom in arms and the director of its forces. Though disturbed for a few years by a schism, the result of Roman faction, the reign of Innocent II. (1130-43) was a time of greatness. The religious orders had from the first rise of western monasticism been strong upholders of the papacy, and each order as it was founded laid its new-born zeal at the disposal of Rome. Innocent gained much from the support of St Bernard, backed by all the strength of the Cistercian order. Under Hadrian IV. (1154-59), a native of St Albans, named Nicolas Breakspear, the only Englishman who has been raised to the papal chair, the papacy entered on a struggle with the Emperor Frederick I., who was determined fully to enforce his imperial rights. In theory pope and emperor supplied each the complement of the other's power, the one being God's viceregent in spiritual, the other in worldly things; but the limits dividing their spheres of action were undefinable, and when both were strong they were almost forced into hostility. Among the definite causes of dispute was the sovereignty of the pope over certain parts of Italy which had been bequeathed to the papacy by the Countess Matilda of Tuscany (died 1115). The popes were upheld by a league of the Lombard cities, which carried on a long war with the emperor; he was defeated, and in 1177 submitted to Alexander III.

The papal authority reached its greatest height under Innocent III. (1198-1216), who ruled as the head of a vast spiritual empire, founded on the reverence of mankind for righteousness. He was master in Italy. His strife with two emperors ended in the success of his ward, Frederick II., inheritor of the Sicilian throne, whom he crowned emperor. By excommunication he forced the king of France to put away his paramour; he deposed John of England, and compelled him to become his

vassal. The kings of many nations submitted to his reukes. The Latin conquest of Constantinople brought the East for a while under the papal obedience, and a crusading army began to extirpate the heretics of Languedoc. More important than all was the foundation of the orders of St Dominic and St Francis, which gave the pope well-organised and generally devoted forces in every land. Innocent was the first pope that exercised full dominion over the States of the Church. Their position as temporal sovereigns brought his successors into collision with Frederick II., who, already king of Sicily and Naples, wished to gain Central Italy. Had he done so he would have made the papacy dependent on himself. Gregory IX. (1227-41) and Innocent IV. (1243-54) resisted him by every means, spiritual and temporal, at their disposal. The Italian cities of the Guelph or papal party were their strongest allies. Innocent declared the emperor deposed, and found allies against him in Germany. The papal resources were strained; money was extorted from foreign countries, especially from England, and the papacy lost in repute by its demands. The struggle was continued against Frederick's house until it was extinguished. All danger of subjection to the empire was past; but the papacy owed its final success to Charles of Anjou, who was invested with the kingship of Sicily and Naples. This gave France an interest in Italy, and led to the subjection of the papacy to the French king. The imperial power having fallen, Boniface VIII. (1294-1303) sought to take the emperor's place as head of Europe. His aims were secular and his temper violent. National monarchies were being built up in England and France by strong kings. The claims of Boniface were subversive of their domestic policy; they refused to admit them, and he quarrelled with both kings. The Italian partisans of Philip IV. of France seized him; he was brutally treated, and died soon afterwards.

Philip procured the election of a Frenchman, Clement V. (1305-16), who resided at Avignon in Provence, afterwards sold to the papacy. There the papal court remained for about seventy years, a period called the 'Babylonish Captivity,' during which the popes were much under the influence of their powerful neighbour of France. A long struggle with the Emperor Louis IV., in which the popes were successful, injured the reputation of the papacy. During its course men began to criticise the character and claims of the papacy. It was attacked on ecclesiastical grounds by the 'Spiritual Franciscans,' and by scholars like Ockham, and on political by the imperial legists. The court at Avignon was luxurious and venal. Little revenue came from the States of the Church, which fell into disorder during the pope's absence, and large sums were raised from national churches and by corrupt means. Fearing to lose all authority in Italy, Gregory XI. returned to Rome in 1378, but died there immediately afterwards. Urban VI. was elected, but the French cardinals, supported by the king of France and the Angevin queen of Naples, rebelled, and elected Clement VII. During the schism which ensued the obedience of Europe was divided between rival popes. In order to heal the schism the cardinals revived the long disused authority of a general council. The Council of Pisa (1409) failed of its object. The reformation as well as the reunion of the church was largely desired. In England Wyclif urged apostolic poverty as the only cure for abuses. His teaching was of little practical importance, save that it helped forward the revolt of Bohemia, where the Slavs regarded the Latin liturgy as a badge of German superiority. Many orthodox churchmen desired to see the abuses of

the papal court reformed and the churches of the several countries preserved from undue papal interference. By the Council of Constance the schism was closed, and Martin V. (1417-31) was elected pope; the council proved unequal to deal with reform. Martin's wise administration raised the papacy from its low estate; he regained its possessions, and made its power widely felt. The Bohemian war made another council inevitable; it met at Basel in 1432, it attacked Eugenius IV. (1431-47), raised up an antipope, and ended in contempt. Meanwhile the Greeks, hoping for help against the Turks, submitted to the holy see. In another respect the papacy was specially affected by the troubles of the Greeks. It readily adopted the learning and culture brought by the Greeks to Italy. The genius of Nicolas V. (1447-55) conceived a new ideal. The 15th century was an age of splendour; its magnificence was conspicuous in the lives not merely of princes, but even of nobles, merchants, and bankers. As the papacy outstripped all earthly powers in greatness, so in the mind of the pontiff was Rome its seat to impose on the imagination of all the world by an exterior grandeur which should outline that of the city of any earthly potentate. But his was no vulgar ideal of mere magnificence; Rome to him was to be the protectress of the arts, the home of learning, the central point of culture in the Christian world; and all this was but to typify and render sensible the supremacy of religion.

Under Pius II. (1458-63) the pope again appeared as the natural head of the forces of Christendom united in arms against the infidel. Pius died when actually setting out on a crusade, and his plans failed, but they gave the papacy renewed importance in the eyes of Europe. His successors, inheriting generally the views of Nicolas V. in regard to Rome as the material expression of papal greatness, did not inherit the loftiness of his spirit. Whilst pursuing the idea of surrounding the papal dignity with pre-eminent splendour, some, like Paul II. (1464-71), betrayed a sympathy for the pagan renaissance which is unmistakable, and which cannot fail to have diminished the veneration due to the head of the church. Other popes, like Alexander VI. (1492-1503) or Julius II. (1503-13), were bent on founding in the Italian states princedom either for their relatives or for the papal chair. This is specially true of Alexander (Borgia), whose earlier life had been immoral, and who as pope caused scandal by his undisguised love of worldly pleasures; whilst his son Cesar, an able, unscrupulous man, made matters worse by his crimes.

Meantime the idea of reform had not slept—witness the activity of such a man as Cardinal Nicolas of Casa; but efforts like his were inspired by individual minds of a specially lofty turn, and at most had the countenance of supreme authority; however widespread, they were local and were not that general 'reformation in head and members' which had been so loudly and so earnestly called for. The inevitable day of reckoning came, but in a guise which none expected. In place of reform the Protestant Reformation effected a ruthless breach with the past, and instead of the enforcement of the law of the church that law itself was repudiated. Events now convinced, but too late, the most unwilling minds that what priests and bishops, regulars and seculars, theologians and zealous laymen had pressed for had been indeed the need of the time. Rome itself furnished a lamentable illustration of the ruin that had come upon the church. Clement VII. (1523-34), though he had his own political aims, was as a man not unworthy of his office, and by character the least able to bear the brunt of the storm; yet it was he who witnessed Rome ruthlessly sacked (1527), and

that by the troops of Charles V., who during the first half of the 16th century was the mainstay of the Catholic cause, and by his dignity as then emperor-elect the recognised protector of the Roman Church. The impression made by this event on all religious minds is well expressed in the measured but weighty words of Cardinal Sadoletto. 'If those,' he writes, 'had done their duty on whom the obligation chiefly rested (I speak not of the pontiff whose virtues, mildness, and uprightness are known not as great merely but as admirable), the priesthood would still be venerated as of old, and not now exposed to injury and contempt. I say what I feel, and God and man are my witnesses, that this best of pontiffs desired to cure these corrupt morals; but the thing needed the knife, not a salve, and his nature and kindly spirit shrank from strong measures.'

From this point the history of the papacy to the close of the 18th century falls naturally into three divisions. From 1530 to the early years of the 17th century there takes place a reconstitution of the papacy on the basis of Catholic reform; next follows a century of normal activity on the new basis thus formed; thirdly, a century of decline in influence, the term of which is marked by the conclave in Venice which resulted in the election of Pope Pius VII.

(1) No time was lost in setting about the work which now all recognised as the imperative need. The papacy was not prominent in the work of reform; but the countenance given by Rome to men like Contarini, Pole, and Ghiberti is sufficient evidence that the popes themselves did not intend to be behindhand. The pontificate of Paul III. (1534-50) witnessed two events of considerable importance to the future of the church—the institution of the Jesuits, and the commencement of the Council of Trent. In 1534 Ignatius of Loyola pronounced his vows in the presence of the pope, and thus laid the foundations of a society of men specially devoted to the service of the holy see, with which its fortunes have subsequently been intimately associated. The ideal conceived by Ignatius was that of an order governed by 'a general whom all should be bound to obey under vow, who should be perpetual, possessed of absolute authority, subject entirely to the pope, but not liable to be restrained by any chapters of the order.' Paul III., on September 27, 1540, by the bull *Regimini militantis*, gave the papal approval to the 'form of life' designed by the founder. The Council of Trent, whatever be the import of its dogmatic definitions, is essentially a council of disciplinary reform; but in this place it requires notice as being a council of which, though held at a distance from Rome, the control and effective action really vested in the pope. After long negotiations the council convoked by Paul III. met at Trent in December 1545. As early as 1542 the papal legates had reached that city; but the war between France and Germany which then broke out made the further delay inevitable. It is worth remarking, as showing the influence already possessed by the newly-founded Society of Jesus, that two of its members came to the council as papal theologians. On April 28, 1552, the sittings of the fathers were suspended for two years. On November 29, 1560, the then pope, Pius IV., convoked it for the following Easter. The decree of reformation of morals and government, consisting of eighteen chapters, was adopted in the 23d session. It contained a number of important provisions on the residence of bishops and parish priests, upon the qualifications for the priesthood, and for the erection of seminaries for clerical training. In the 25th session was passed a series of regulations for the regular clergy and nuns. The decrees of the council were formally confirmed by Pius IV. in

1564. By its declarations on dogmatic theology the council gave prominence to the differences existing between Catholics and non-Catholics, and thus more sharply divided Christendom into the spiritual subjects and the enemies of the papacy. The cause of Catholic reform dominated the policy of Paul IV. (1555-59), and from his time the constitution of the Roman see in its modern aspect progressed practically without a check. In this period, too, falls the establishment of administrative bodies called 'sacred congregations,' which henceforth are the recognised and usual organs for the exercise of papal power in the government of the church. Lesser objects were not neglected. If modern Rome has been for so long the city in Europe which has attracted and deserved to attract the curiosity and admiration of all men, this is largely due to the continuation during this period of the works begun under the inspiration of Nicolas V. It is often forgotten that St Peter's itself was not completed till 1626.

(2) By the beginning of the 17th century the papacy as an institution had reconstituted itself in accordance with the circumstances induced by the Protestant Reformation. Its history in this second period shows no such stirring events as had marked the preceding age. But for its future the transfer of the weight of political power from the House of Austria to that of France was of decisive importance. The full consequences of the change were not, of course, perceived immediately, but it is certain it was recognised in Rome as momentous, and was not viewed with satisfaction.

(3) The conclave which assembled in Rome in the year 1700 determined the history of the papacy in the third period. Among the cardinals the one who enjoyed the most respect was the Dominican Cardinal Orsini, the head of a body of cardinals whose views are sufficiently indicated by the name given to them—the *Zelanti*. He was a man of illustrious family, dominated by a sense of duty in all things great and small, of slender intellectual capacity indeed, but endowed with a rare gift of discerning merit and capacity in others; free from petty jealousy, he knew how to gather round him men of ability, and how to use them when he had them. But the change in the balance of power effected during the 17th century determined the election of Cardinal Albani, to whom was given the whole weight of the influence of France. As Clement XI. (1700-21) he was in the most important acts of his reign inspired by Louis XIV. To outward appearance, in the first half of the 18th century, the position of the papacy in its relations with princes and peoples remained as it had been before. To some extent also it is certain that Benedict XIV. (1740-58), by a charm of character which impressed even one so keenly alive to the weak side of humanity as Walpole, staved off the evil day. But before his death the signs of disintegration were unmistakable. Throughout Europe luxury and an accompanying dissoluteness of manners had increased to shamelessness, whilst the school of infidelity in France was now fully organised and confident of victory. The full effect, moreover, of the displacement of the imperial House of Austria as the political prop of the church in favour of France now made itself manifest, and the Jansenist troubles of the 17th century bore bitter fruit. The whole church of France had become involved in the quarrel. On the one side the bishops nominated by the king insisted, as in duty bound, upon the acceptance of the bull *Unigenitus* issued by Clement XI. in 1713, whilst on the other a large body of the clergy and a not less large body of the laity resisted a bull involving assent to a lengthy series of abstract theological propositions. Of the violence of these

theological quarrels it is now almost impossible to form an idea, and more than one cool observer believed schism in France to be imminent. Thus, whilst the papacy needed every aid to stem the rising tide of infidelity, it found those on whose help it should have been able to depend involved in intestine conflict. The second half of the 18th century was for the papacy a slow agony, the successive stages of which do not call for notice here. By the suppression of the Jesuits the papacy not merely deprived itself of an able body of strenuous defenders, but cast by the very act dismay among the ranks of many devoted to the church. Moreover, the manner of the fall of the Society of Jesus was not calculated to lessen the weight of responsibility, or it may be said the odium, attaching to so grave an act. It fell with dignity, and the cruelties inflicted upon many of its members called forth in unlikely quarters sympathy for the victims. It was natural that onlookers should be more impressed by these more recent occurrences than by the long chain of events which had brought the holy see to view the suppression of the Order as inevitable.

Even the faithful House of Austria now fell away, and the Emperor Joseph II. assumed to himself and exercised functions which the popes had ever claimed as pertaining to the supreme ecclesiastical power. The fruitless journey of Pius VI. (1775-99) to confer with Joseph II. at Vienna in 1782 is the outward evidence of the humiliation of the papacy. Before long the Revolution which broke forth in France swept away king and priest and all established institutions in church and state, involving Catholic Europe in disorder. An outbreak in Rome, fomented by the agents of the French ambassador, forced the pope from Rome as a prisoner (1798); and, after his removal from one place of confinement to another, Pius VI. died at Valence on 29th August 1799, Napoleon having, two years before, in anticipation of his death, given orders that no successor should be elected, and that the papacy should be abolished.

A few words must still be given to the present and fourth period of the modern age of the papacy. Through the instrumentality of schismatic Russia the conclave of cardinals met in the monastery of St Giorgio Maggiore at Venice on the 1st of December 1799. The conclave lasted for nearly four months. Just as the conclave of 1700 was decisive as regards the fortunes of the papacy in the 18th century, so was this of 1800 as regards the 19th century. The possible candidates were numerous; the choice finally rested on the Benedictine cardinal, Chiaramonti. Nothing better illustrates the confusion of ecclesiastical ideas in the 18th century, or a chief source of the weakness of the church, induced by universal suspicion, than an accidental expression used by a member of the conclave, Cardinal Langini, in his private diary. Explaining the objections felt by some in the conclave to Chiaramonti, he notes under 12th March 1800, only two days before the election, 'Chiaramonti, as a Benedictine, being suspected of Janseism.'

No one who reviews the history of the 19th century can doubt that events have justified the choice of the cardinals. After enduring shocks which to human eyes seemed to threaten its very existence, the papacy has become once more a factor of the greatest potency in the civilised world. That this is so is largely the result of the personal character of Chiaramonti, the new pope, who as Pius VII. (1800-23) combined a conciliatory temper with an unconquerable inflexibility when vital principles were involved. The history of his relations with Napoleon I. is sufficient of itself to explain how he, destitute apparently of all human help, won for himself the respect

of those who would naturally have been the first to contest his spiritual authority. In the space of his pontificate he was able to restore the papacy to the position which it had held a hundred years before. Under him began that restoration of Catholic life and Catholic aim which has attracted some of the ablest intellects and most statesmanlike minds of the century to the service of the church; and under him and his successors was accumulated a reserve of Catholic strength which is one of the most interesting and remarkable features of the 19th century.

The successors of Pius VII. by the personal purity of their lives contributed greatly to advance this Catholic revival. The reigns of Leo XII. (1823-29), Pius VIII. (1829-30), and Gregory XVI. (1831-46) witnessed an increase of zeal on the part of the Roman Catholic clergy everywhere, and a marked development of the spirit of loyalty to the holy see both in them and in the ranks of the Catholic laity. In France the exertions of Montalembert, Lamennais, and others firmly established a new school, which, whilst professing enlightened liberal doctrines, was founded on the principle that complete and loyal submission to the teachings and direction of Rome was the first duty of every Catholic. In England the passing of the act for Catholic emancipation in 1829 gave liberty, and with it new life, to Roman Catholics.

Pius IX. (1846-78) was chosen to succeed Gregory XVI. He had generally been credited with advanced liberal views, and had exerted himself during the civil disturbances under his predecessor to secure some mitigation of the punishments meted out to the political prisoners. He began his rule with a proclamation of general amnesty for such offenders, and for the first two years he maintained a policy of liberal political reform. At the end of that time he had practically become a prisoner in the hands of the revolutionary party, and on November 24, 1848, he escaped in disguise from Rome to Gaeta. Here he remained till in April 1850 he was brought back to Rome by the French troops. On September 29, 1850, he took the important step, as regards the English Catholics, of establishing a hierarchy of bishops in communion with the Roman see. On December 8, 1854, he issued the bull *Ineffabilis Deus*, by which the doctrine of the Immaculate Conception of the Blessed Virgin Mary was declared to be a dogma of the Christian faith. Ten years later (December 1864) he published the famous encyclical *Quanta cura*, together with the *Syllabus*, or catalogue of errors of the day which called for special condemnation. Romagna, a portion of the pontifical states, was occupied by the Sardinian troops in 1860, and in September of the same year, after a stubborn resistance made by the pope's troops at Ancona, most of the States of the Church were annexed to the kingdom of Victor Emmanuel. From that time till 1870 Pius IX. was maintained in Rome by a French garrison. On the 18th of July of that year (1870) the Vatican Council, which the pope had assembled at Rome, decreed the dogma of Papal Infallibility part of the faith of the church. Upon the outbreak of the war between France and Prussia the French garrison was withdrawn from Rome, and on the news of the defeat of the French the Sardinian troops moved upon Rome. After a slight show of resistance Victor Emmanuel's army entered the city on the 20th September 1870, and from that time the temporal power of the pope has ceased to exist. Pius IX. for the rest of his life remained in the Vatican, refusing to recognise what had been done. See the article Pius.

Leo XIII. (1878-1903) continued to maintain towards the kingdom of Italy the attitude taken up by Pius IX., secured an influence which made itself felt, and won for himself the respect of Euro-

pean powers. In Germany his wise diplomacy brought about a mitigation of the anti-Catholic 'May Laws.' In a question of disputed rights over the Caroline Islands his arbitration was sought by Germany and Spain, and his award accepted as final. The state of Ireland caused him to despatch thither a special envoy to study on the spot and report to him the nature of the agrarian difficulties which had arisen there, and in 1888 he condemned boycotting and the Plan of Campaign. In 1891 came the encyclical on capital and labour. Other facts are recorded in the article LEO.

Pius X. (1903-14) forbade the use in church services of any music later than Palestrina; appointed a commission to codify the canon law (1904), and another to restore the text of the Vulgate (1907); refused to allow the French bishops to accept the church policy of the French republic; condemned Loisy's works and 'modernism' in every form. See PIUS.

Benedict XV. (1914-22) attempted, unsuccessful-

fully, to open peace negotiations during the Great War. See BENEDICT.

Pius XI. began his pontificate (1922) with the reputation of a cultured and capable administrator, imbued with liberal ideas.

Pope, ALEXANDER, the greatest poet of his age, and the most brilliant satirist that England, or perhaps the world, has ever produced, was born in London on the 21st of May 1688. He was of good middle-class parentage, but not, as he afterwards characteristically endeavoured to make out, of aristocratic descent. His grandfather, Alexander Pope the elder—whose pedigree he attempted to derive, though on very inadequate evidence, from the earls of Donne—was a clergyman of the Church of England. His son, the poet's father, was placed with a merchant at Lisbon, where he became a convert to the Roman Catholic Church. On his return from Lisbon he seems to have followed the trade of a linen-draper in Broad Street, whence, after his marriage with Edith Turner, the poet's mother, he migrated to Lombard Street. There Alexander the younger first saw the light. In his infancy, and indeed up to the age of ten, he does not seem to have been either weakly or deformed. In the opinion of a kinsman, 'it was the perpetual application he fell into in his twelfth year that changed his form and ruined his constitution'; and it is possible that this may have contributed to and aggravated a misfortune which could hardly have been due to any such cause alone. It is at any rate certain that Pope's application to study must have been both early and intense, for deep traces of thought and culture are no less conspicuous than natural precocity of genius even in his most juvenile poems; and he certainly owed little to his teachers. His education, thanks no doubt to the disabilities created by his inherited creed, was unmethodical and imperfect to the last degree. He seems to have passed from one incapable Catholic priest and ill-ordered Catholic seminary to another, until at twelve years of age he was removed, knowing little more apparently than the Latin and Greek rudiments, to Binfield near Wokingham, to which place his father had by that time retired. Yet in this very year he wrote his *Ode on Solitude*, an insignificant but not unpromising performance, and at fourteen, according to his own account, he composed the poem on *Silence*, in imitation of Rochester's *Nothing*, which both in manner and matter is astonishingly mature. It was at the same age that he produced the first of his works which attracted attention, a *Translation of the First Book of the Thebais of Statius*, a poem memorable above its intrinsic merits from the fact that in it the English heroism-complex is already beginning to take the new mould into which, in his hands, it was destined to be recast. It is during the next two years, that is to say, at the marvellously early age of from sixteen to eighteen, that Pope's career as a recognised English poet may be said to begin. For it was at some time during these years (1704-6) that he wrote his *Pastorals*, which, though not published till 1709, were shown to and highly commended by all the leading critics of the day, and were the means of bringing their young author acquainted with the dramatist Wycherley, then advanced in years, with whom he commenced a singular correspondence, the tenor of which he audaciously misrepresented in later life.

It was to Wycherley, too, that Pope owed his first introduction, which took place a little later, to London life, where the youth's extraordinary talents were quickly recognised, and where he was not long in establishing a friendship with Addison, Steele, Swift, Arbuthnot, and other famous wits and poets of the day. In 1711 he published his *Essay on Criticism*, a poem which, whether written in 1709 or 1707—and it may have been his invincible habit of committing small acts of dishonesty for still smaller gains that suggested the antedating of the composition—was a sufficiently splendid achievement for the age either of nineteen or

twenty-one. It at once, or nearly at once—for it hung for a little at first at the booksellers—placed him in the front rank of the men of letters of his time. Critical opinions differed, and down to our own day have continued to differ, as to the degree of merit possessed by this remarkable poem in respect of its matter—some depreciating its critical aphorisms as platitudes, others elevating them into utterances of gnomic wisdom; but its excellences of form and maturity of style are not open to question in any competent judgment. The year 1713 witnessed the publication of *Windsor Forest* (written, according to Pope's account adopted by Warburton, in 1709), and this was succeeded in the following year by the poem on which Pope's claim to the gift of poetic imagination may perhaps be most securely rested, *The Rape of the Lock*. Necessarily precluded by the deliberate triviality of its subject from appealing to the higher emotions which imaginative poetry of the serious order arouses, this piece displays, in addition to the exquisite charm of its versification, a grace of delicate fancy which at times almost recalls the creator of Puck and Ariel, and the diviner of the dream-whispers of Queen Mab.

We now reach the commencement of what was probably the happiest and most prosperous period of the poet's life. His brilliant success had not yet brought with it much pecuniary profit, but in the year 1713 a project was set on foot by him, and warmly supported by Swift and others of his friends, which was destined not only to add to his fame, but to place his fortunes on a substantial basis for life. This was the translation of the *Iliad*, a work published by subscription, of which the last volumes were issued in 1720. The time of its composition was among the fullest and busiest of Pope's life. In 1716 his father removed from Binfield to a house at Chiswick, where he resided till his death in the following year. Pope was now the foremost of the literary lions of fashionable London, and almost as conspicuous a personage in the drawing-rooms of ministers and magistrates as in the coffee-houses of the wits. Political differences, aggravated by well or ill-founded suspicions of the elder writer's jealousy of the younger, had alienated Pope from Addison; but, though he had already begun his almost life-long quarrel with the eccentric John Dennis, it had not yet taken on a character of any very extreme virulence. In 1718 he purchased out of the early profits of the *Iliad* the famous villa and grounds of Twickenham, which he occupied till his death.

A translation of the *Odyssey*, less successful because largely 'farmed out' to inferior hands, was published in 1725 and the following years; and in 1727 appeared the first two volumes of a collection of *Miscellanies*, from the joint authorship of Pope and Swift, a work famous as being the first shot fired in the war between the poet and 'the Dunces.' In March 1728 the third volume appeared, and the furious and scurrilous retorts wrung from the persons ridiculed in it elicited the retaliatory publication of the first three books of the *Dunciad*. This work Pope represented as having been written in reply to their attacks, but it (or a first draft) has been ascertained to have been in existence as early as 1725, and to have been merely withheld until its author had deliberately stung his enemies into a blind and headlong charge. 'Martianus Scribblers,' in fact, played the part of the lance with which the Spanish picador irritates the bull to frenzy; the *Dunciad* was the blade poised ready to transfix him. In this immortal lampoon—for it is too personal in all senses of the word to deserve the title of satire—Pope has rescued the names of a host of insignificant enemies from oblivion. The fourth book, added twelve years later, is of a more serious cast

and of a more general application, and it contains one at least of the poet's most admired passages. But its incorporation with the earlier poem, with its infelicitous substitution of Gibber for Theobald as the personification of Dullness, is to be regretted. The *Essay on Man*, the first part of which was published in 1733, the *Moral Essays*, and *The Imitation of Horace* conclude the catalogue of Pope's poetic works. The first, a didactic poem, intended to commend to the world the not very profound philosophy which Pope had borrowed from Bolingbroke, is from the point of view of execution a master-piece of weight and wit. The poet's mastery of terse and epigrammatic expression is here seen at its highest; and it has been declared, no doubt with truth, that the *Essay on Man* contains more lines which have won their way to the rank of universally familiar quotation than any poem of equal length in the language. The *Moral Essays* and the *Imitations* exhibited the same qualities exercised upon a series of selected subjects, for the most part, a lighter order.

The last few years of Pope's life were marked by no new creative activity, but devoted to the revision of his published works. He suffered during this period from asthma, which in time developed dropsy, a disease which ultimately proved fatal to him. He died on the 30th of May 1744. As a man the figure which he presented to all but a few close friends was always an unamiable one, and modern research into the facts of his life has unfortunately only tended to deepen the impression. It cannot be denied that many of the smaller and meaner vices of humanity were painfully prominent in the character of Pope. His vanity was insatiable, and his vindictiveness came near to be so: he committed acts of treachery to men, brutality to women, and ingratitude to both. He showed an extraordinary and at times an almost ludicrous preference for the crooked to the straight path, and much of his time was occupied in laying elaborate plots for the deception of posterity and his contemporary public, including sometimes his most intimate friends. Yet it is certain that to these last he must have revealed many lovable qualities. He was undoubtedly capable of warm attachment, and his disposition when appealed to by the sight of want or suffering was genuinely benevolent. It should be remembered, too, in excuse for the acrimony of his satire, that physical misfortune and accidents of bringing up had combined to render him morbidly sensitive to the insults of his adversaries, and that his revenge was not more cruel than his sufferings.

The position of Pope in the history of poetry is easier to fix than his rank among English poets, for the importance and splendour of Pope's contribution to the development of English poetic art are beyond the denial of anyone conversant with the facts. It is a truth superior to and independent of the endless and irreconcilable controversy as to the essence and 'true inwardness' of poetic matter. The poets of the naturalist revival at the end of the 18th century regarded Pope as the brilliant exponent of a false and artificial theory of poetry who had systematically, though of course unconsciously, led men away from the contemplation of the 'true truth' of things. It has on the other hand been contended with much learning and ingenuity by W. J. Courthope that Pope's theory of poetry, if compared with that which it displaced, was a no less distinct and salutary return to nature than that of which Cowper became the pioneer in the later half of the century, and which Wordsworth preached and practised with such notable results towards its close. But even if this contention leaves us unconvinced, we can still find abundant reason for recognising as invaluable the services rendered by Pope to English poetry.

Considered from the point of view of its descriptive and emotional capabilities, the heroic couplet as he received it from the hands of Dryden was an instrument of vast compass but of modulations few and rude. By force of exquisite sensibility wedded to untiring study Pope theoretically deduced and practically educed its hidden powers; discovered, formulated, and imminutely applied the rules for 'discoursing' upon it; and handed it on to posterity in a form whose easy mechanical perfection is attested by the fact that its powers are but too much within the reach of the inferior performer. Considered as a weapon of expression, the heroic couplet of Dryden was a mediæval broadsword which only the mighty thews of its master could wield with any effect. In the hands of Pope it became a rapier of perfect flexibility and temper; and he himself discovered, and acquired mastery over, every trick of fence which it was capable of executing. To have accomplished this alone would have sufficed to perpetuate his name; but Pope has lived and will live in English literature, not only as the virtual inventor of a new poetic form, but as an artist without a rival in any age or language in the adaptation of speech to thought. No one who brings a fairly sympathetic mind to the perusal of the *Epistle of Eloisa to Abelard* will deny to Pope a measure of the lyrical gift and no mean power over the softer emotions. But one must admit that to the taste of the present age there occurs a certain coldness and artificiality in his portrayals alike of the face of nature and of the passions of man. He appeals rather to the brain than to the heart. Ideas and not emotions are his province; but to the metric presentment of ideas he imparts a charm of musical utterance unachieved before his time, and a lucidity of illustration, a brilliancy of wit, a command of apt and terse expression, and a combined ease and dignity of manner which have never been equalled since. To have done this is to have well deserved immortality as a man of letters; whether it is also to have established a title to the name of 'poet,' as understood in these days, every man who frames his own definition of poetry must decide for himself.

The editions of Pope have been fairly numerous. The first, by his friend Bishop Warburton, was an answer to Bolingbroke's attack on Pope's memory, and appeared within a few years of his death. Dr Joseph Warton's was virtually a reply to Warburton's; and the controversy on the power of the poet was revived in the 19th century by Bowles and Roscoe, who each published an edition of his works, and in whose polemics Byron took a memorable part. All other editions, however, were superseded by that of Elwin and Courthope, which was founded on a mass of documentary material collected by J. W. Croker; the concluding volume, containing Courthope's biography of the author, was published in 1880. See also George Paston, *Mr Pope, his Life and Times* (1909). Mr (as *London Mercury*, October 1924) attributes to Pope a number of pieces in *Poems on Several Occasions* (1717).

POPE, JOHN (1822-92), an American general, was born in Louisville, Kentucky, graduated at West Point in 1842, and entered the engineers. He served in Florida (1842-44) and in the Mexican war, and was breveted captain for gallantry. He was afterwards employed in exploring and surveying in the west, until the outbreak of the civil war, when he was appointed brigadier-general of volunteers. In 1861 he drove the guerrillas out of Missouri; in 1862 he captured New Madrid in March and was made major-general, commanded the Army of the Mississippi in the operations against Corinth, and was assigned to the command of the Army of Virginia, with the rank of brigadier in the regular army. For fifteen days in August he faced Lee, but was defeated at the second battle of Bull Run, on the 29th and 30th. He then requested to be relieved, and was transferred to Minnesota, where he kept the Indians in check.

He held various commands until 1886, when he retired. In 1882 he became major-general. Pope attributed his defeat at Bull Run to the conduct of General Fitz-John Porter, who was tried by court-martial and cashiered; but this verdict occasioned much controversy, in which General Grant ultimately took Porter's side (*American Review*, December 1882), and in 1886 the latter was restored to the army with the rank of colonel.

Poperinghe, an old commercial town of Belgium, in the province of West Flanders, 4 miles from the French frontier, and 8 miles W. of Ypres by rail. The town has manufactures of lace, linens, and woollen cloths. It figured prominently in the Great War. See WAR (GREAT). Pop. 12,000.

Popinjay (Fr. *papegai*, Ital. *papugallo*, Low Gr. *papagais*), a parrot; a figure of a bird put up as a mark for archers to shoot at (*papings* being a Scottish form for this sense); see KILWINNING. The green woodpecker is also sometimes called popinjay.

Popish Plot, the name given to an imaginary plot on the part of the Roman Catholics in England during the reign of Charles II., the object of which was believed to be a general massacre of the Protestants. See OATES.

Poplar, a metropolitan and parliamentary borough in east London, between Stepney and West Ham, has two parliamentary divisions (Bow and Bromley, South Poplar); pop. (1921) 162,618.

Poplar (*Populus*), a genus of trees, forming along with willows the family Salicaceæ, and having dioecious flowers arranged in catkins, both male and female flowers with an oblique cup-shaped perianth. The seeds have silky hairs, as in willows, and are readily wafted about by the wind. The species are chiefly natives of the temperate and cold regions of the northern hemisphere. They are large trees of rapid growth, with soft wood, and broad, heart-shaped, ovate, triangular, or lozenge-shaped, deciduous leaves, on rather long stalks.

Branch and Male Catkin of
Populus alba canescens.

Many of them are very beautiful trees. The catkins appear long before the leaves. Few poplars are of much value for their timber, which is generally white, soft, and light; but from their rapid growth they are useful as yielding firewood, where the scarcity of other fuel renders it necessary to plant trees for this purpose, and they are often planted as ornamental trees, producing an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. Besides the species known by the name Aspen (q.v.), or Tremulous Poplar, the following seem the most worthy of notice. The White Poplar, or Abele

(*P. alba*), a native of the southern parts of Europe, and reckoned among British trees, but probably not indigenous in Britain, is a tree of 80 feet or upwards, with a fine spreading head, and roundish, heart-shaped, lobed, and toothed leaves, which are smooth, shining, and dark-green above, downy and silvery-white beneath. The tree loves low situations and clay soils. Its variety, the Gray

Poplar (*P. alba canescens*), is of more vigorous growth, a large spreading tree, the leaves not so dark green above or so white beneath. It is not of so rapid growth as the white poplar; and its wood is harder and better. The tree generally begins to rot in the heart when forty or fifty years old. Like most of the other poplars, it fills the ground around it with suckers. The Black Poplar (*P. nigra*), a native of most parts of Europe, and perhaps of England, is a tree 50 to 80 feet high, with an ample spreading head, viscous leaf-buds, and deltoid or unequally quadrangular, perfectly smooth leaves. The 'cotton' from the seeds has been tried (unsuccessfully) in France and Germany for making cloth hats and paper. The Lombardy Poplar (*P. nigra*, var. *pyramidalis*) has erect instead of spreading branches. It attains a height of 100, or even 150 feet, and is remarkable for its erect form, contracted head, and very rapid growth. It is often planted as an ornamental tree, although not so generally as in the end of the 18th century, when it was thought preferable for ornamental purposes to every other tree. *P. diversifolia* forms forests along the rivers of Turkestan. Widely distributed on the Pacific coast of Asia, *P. Maximowiczii* attains 100 feet in height and 6 feet in diameter of trunk. Perhaps most interesting of all poplars is *P. euphratica*, a polymorphic species which some divide into many sub-species, showing a wonderful variety, especially in leaf-form. Its geographical range is extraordinary. It extends from northern China through Tibet (where it is the chief tree planted), India (whose only indigenous poplar it is), Afghanistan, Turkestan, Mesopotamia, Syria, and Egypt, whence it branches southwards to Kenya and westwards by the oases of the Sahara to Algeria and south-east Spain. It is held to be the tree on which the Jews hung their harps in their exile. 18 to 30 feet high, it branches low enough for this to be quite easy. (There is, indeed, a weeping willow called *Salix babylonica*, but it comes not from Babylon, but from China and Japan.) The wood is almost of no value. It is generally propagated by layers. The Cottonwood of North America, absurdly known as Black Italian Poplar (*P. monilifera*), particularly abundant on the upper parts of the Mississippi and Missouri, is valued as a timber-tree, and has been pretty extensively planted in Britain. The female catkins resemble a string of pearls. The leaves are deltoid. It is of very rapid growth, and attains a height of 100 to 120 feet. The Balsam Poplar, or Tacamahac (*P. balsamifera*), a common ornamental tree in Britain, is a native both of North America and of Siberia, and has ovate-oblong leaves, which in spring are of a delicate yellow tint, and have an agreeable fragrance. The leaf-buds are viscid. In size of leaf no other species equals Swamp Cottonwood (*P. heterophylla*), a native of the southern states of North America, the leaves of which are often 6 inches long. See ASPEN, TACAMAHAC.

Poplin (Fr. *papelaine*; possibly from the papal town of Avignon, where it was formerly made), a fabric which has been long made in France, from which country the manufacture was introduced into England and Ireland in the 17th century by Protestant refugees. Poplin consists of a warp of silk and a weft of worsted, and the latter being thicker than the former produces a corded appearance. The worsted yarn gives substance to the fabric, and a soft silky face is produced by the way in which it is woven. Poplins may be either plain or figured. The latter were much used about 1870 for curtains and for covering furniture.

Popocatepetl ('smoking mountain'), a volcano about 40 miles S.E. of the city of Mexico. It

rises in the form of a cone to a height of 17,784 feet above the sea-level. No great eruption has been recorded since 1540; it still smokes, however. It is often sealed, and in and around its crater (5165 feet in diameter, and nearly 1000 deep) a good deal of sulphur is obtained.

Poppy (*Papaver*), a genus of Papaveraceæ, with two (rarely three) sepals, which very soon fall off; four (rarely six) petals; numerous stamens seated on a receptacle; the stigma crowning the ovary (without a style) in the form of 4 to 20 rays; the capsule opening by pores under the persistent stigma, imperfectly divided into cells by partitions as numerous as the rays of the stigma, but which do not reach the centre, and the seeds extremely numerous. There are numerous species of poppy, mostly natives of Europe and Asia, some of them found even in very northern regions, but most of them in the warmer temperate parts. They are herbaceous plants, annual, biennial, or perennial, mostly sprinkled with bristly hairs. They have a white milky juice; a disagreeable narcotic smell, particularly when bruised; pinnatifid or bipinnatifid leaves, more rarely jagged or toothed leaves; and large showy flowers, which readily

plentifully sprinkled on the top. The seeds yield 30 to 40 per cent. or more of oil, and the oil-cake is useful for manure or for feeding cattle. The oil is sometimes used by painters and by soap-boilers. Some farmers in Flanders sow poppies in alternate rows with carrots. The variety chiefly cultivated as an oil-plant has dull reddish flowers, large oblong capsules, and brownish seeds; but the white-flowered variety, with globular capsules and white seeds, is also used. The Oriental Poppy (*P. orientale*), a native of Armenia and the Caucasus, a perennial species, is often planted in gardens on account of its very large, fiery-red flowers. Its unripe capsules have an acrid, almost burning taste, but are eaten by the Turks, and opium is extracted from them. Several species are British, all of them local, rare in some places, and troublesome corn-field weeds in others. Among them is the Corn Poppy or Common Red Poppy (*P. Rhœas*), with bright red flowers, and deeply pinnatifid leaves. A variety with double flowers is cultivated in flower-gardens under the name of *Carnation Poppy*. Among the ancients the poppy was sacred to Demeter.

Poppy-head. See PEWS.

Populonia, an ancient city of Etruria (q.v.), near Piombino (q.v.).

Porbeagle, sometimes called 'Beaumaris Shark' (*Lamna cornubica*), is a shark found on the British coasts, in the Atlantic, Mediterranean, on the American coast, and in Japanese waters. Its usual length is 4 feet, but it sometimes attains a length of 10 feet, and is sometimes caught in mackerel and salmon nets, and even on haddock lines. It lives on cuttle-fish, pilchards, herrings, hake, and smaller cartilaginous fishes. In Mediterranean countries it is eaten as human food.

Porcelain. See POTTERY.

Porcellanite, a very hard, impure, jaspideous rock, frequently met with in the immediate vicinity of intrusive eruptive masses. In most cases porcellanite is simply a highly baked and altered argillaceous rock—shales being frequently converted into porcellanite along their line of junction with an igneous rock.

Porch, a building forming an enclosure or protection for a doorway. In mediæval and Elizabethan architecture the porch was very common in domestic architecture. In churches it was almost universal in England, most often on the south side

Opium Poppy (*Papaver somniferum*):
a, whole plant; b, flower and leaf; c, ripe capsule; d, seed and section of do. enlarged. (Bentley and Trimen.)

become double by cultivation. The capsules are curious in the manner in which they fling out their seeds when the plant is shaken by the wind; each capsule being somewhat like a round or oval pepper-box, with holes, however, not in the top, where rain might get in by them, but under the projecting rim. By far the most important species is that known as the Opium Poppy (*P. somniferum*), also called the White Poppy and the Oil Poppy (see OPIUM). But the same species is important on account of the bland fixed oil of the seeds, and is much cultivated as an oil-plant. Poppy-oil is as sweet as olive-oil, and is used for similar purposes. It is imported into Britain in considerable quantities from India. The poppy is also extensively cultivated for it in France, Belgium, and Germany. The seed contains no opium or any narcotic principle, and was well known to the ancients as a pleasant article of food, fit to be eaten by itself or with bread; some German cakes have poppy-seed

Porch of Aldham, Essex (1350).

of the nave, of stone or flint-work (in East Anglia), but sometimes also of wood. See also GALLER.

Porcupine, the chief gold-producing district of Canada, in Ontario, 150 miles NW. of Cobalt.

Porcupine is the name given to a large family of Rodentia—the Hystricidae—with numerous well-defined genera and species. The Common Porcupine (*Hystrix cristata*) is found in southern Europe, as well as in Asia and Africa, and is one of the largest of rodents; it has a heavy aspect and a grunting voice, whence the name Porcupine (from O' French *porc*, 'a hog,' and *espin*, 'a spine'). The porcupines of the New World are sometimes included in a separate family; they comprise two well-marked forms—the Urson (*Erethizon dorsatus*) of North America and the Prehensile-tailed Tree Porcupines (Cercalabes) of South America. The most marked peculiarity of the porcupine is of course the presence of the quills, which are simply thickened hairs; gradations between ordinary hairs and the thickest and longest spines exist to prove this statement. Occasionally the spines end in a peculiar cup-shaped extremity. The armature of spines is of the greatest value to the porcupine, though their use is entirely for defensive purposes. It is hardly necessary to deny the popular belief that the animal can shoot out its quills like so many arrows; the notion has arisen from the fact

Common Porcupine (*Hystrix cristata*).

that when the animal erects its spines loose ones sometimes fall out. See ECHIDNA, GLOBE FISH.

Portage. See PHILADELPHIANS.

Pordenone, LL, a name for the religious painter Giovanni Antonio Licinio (1483-1539), born near Pordenone in Venetia.

Porl. See BJORNEBOEG.

Porifera. See SPONGES.

Porism is defined by Simson as a proposition to demonstrate that some one thing or more things are given, to which, as also to each of innumerable other things, not indeed given, but having the same relation to those which are given, it is to be shown that there belongs some common affection described in the proposition. Playfair defined a porism to be a proposition affirming the possibility of finding such conditions as will render a certain problem capable of innumerable solutions. Owing to the loss of Euclid's three books on porisms, and the obscurity of the account given by Pappus of their contents, there has been much discussion among geometers as to the nature of a porism. The two most important books on the subject are Simson's *De Porismatibus* in his *Opera Reliqua* (1776), and Charles's *Les trois livres de Porismes d'Euclide* (1860). Charles is of opinion that the porisms were closely allied to the modern theories of anharmonic ratio, homographic division, and involution.

Pork. See PIG, CHICAGO, DIET, FOOD, HAM, TRICHINOSIS.

Porosity. By this term we express the experimental fact that no kind of matter completely fills the space it occupies. On the atomic theory it is obvious that this must be the case if the atoms of matter have any form save one or two special ones, such as cubes or rhombic dodecahedrons. The Florentine Academicians, in their attempts to compress water, proved the porosity of silver by flattening a sphere of that metal, filled with water and soldered. The water escaped through the silver, and stood in fine drops on its surface. The porosity of liquids is easily shown by mixing alcohol and water. The bulk of the mixture is considerably less than the sum of the bulks of the components.

Porous Jars. See REFRIGERATION.

Porphyrite, a petrographical term the precise limitation of which, owing to diversity of usage, is somewhat difficult to define. By geologists who favour a classification of igneous rocks in which the time factor is recognised, it has been used to designate Andesites (q.v.) of pre-Tertiary age. Others use it as meaning merely a more or less highly-weathered andesite. In recent petrographical literature it is applied to hypabyssal igneous rocks in which the dominant colourless porphyritic constituents are soda-line feldspars, types with porphyritic orthoclase being designated porphyry. Most porphyrites have the same chemical and mineralogical characters as diorites and andesites, but differ in texture. They are, as a rule, strongly porphyritic, and the ground-mass of the rock is usually holocrystalline. Some ferro-magnesian mineral is always a prominent constituent, and thus one may distinguish mica-, hornblende-, and augite-porphyrites; other types contain quartz in addition, and those are named quartz-mica-porphyrite, &c.

Porphyrogenitus (Gr., 'born in the purple'), a title given to the Byzantine emperor Constantine VII. (912-959).

Porphyry (Gr., 'purple'), a term originally confined to an Egyptian rock used in sculpture and known as *porfido rosso antico*. It occurs as a dyke or vein some 65 to 85 feet thick in the granite of Jebel Dokhan (formerly called *Mons Porphyrites*) in Egypt, between Siont and the Red Sea. It is composed of a felspathic base, in which are disseminated crystals of oligoclase feldspar, with some plates of dark hornblende, and grains of an iron oxide. The beautiful pink or red colour of the porphyritic feldspar and the fine-grained base is due to the diffusion of the red variety of epidote, called Withanite or Piedmontite. The term porphyry is not now used to denote any particular rock, but is applied by architects and others to any igneous rock which, like the *porfido rosso antico*, has a homogeneous, compact base or fine-grained ground-mass, through which are scattered distinct crystals of one or more minerals. By geologists the term porphyry is seldom used without some descriptive word bracketed with it, as quartz-porphyry, orthoclase-porphyry, augite-porphyry, &c. See PORPHYRITE.

Porphyry, one of the greatest Neoplatonist philosophers, was born at Tyre, or at Batanea, in the year 233 A.D. His original name was Malechus (Heb. *Melech*, 'king'); and *Porphyrios* ('one clad in purple') is but a kind of playful synonym for this royal name. He is said by Socrates the historian and by St Augustine to have been originally a Christian; but this seems improbable, although it is certain that in his youth he was a hearer of Origen, or at least held some intercourse with him at Caesarea in Palestine. What is more certain is that he passed at a later time to Athens, where he studied rhetoric under Longinus, the well-known author of the treatise *On the Sublime*.

It was at Rome, however, whither he repaired about 263, that he found the master who permanently moulded his life. Here he became the most trusted of the disciples of the Neoplatonist Plotinus. After a few years in Rome he went to Sicily, where, if St Jerome's account is to be relied on, he wrote his once celebrated treatise in fifteen books against the Christians, now known only from the replies—themselves lost—which it elicited from Methodius of Tyre, Ensebius of Caesarea, and Apollinaris of Laodicea. His book itself was burned by order of the emperors Theodosius II. and Valentinian in 448. He then returned to Rome, and taught there, where he is said to have died, probably about 303. His own most famous pupil was Iamblicus. For a view of Porphyry's position in the history of the Neoplatonic school, see NEOPLATONISM. He was a very voluminous writer, and, though no very profound thinker, a learned, capable, earnest, and high-minded man. His philosophy keeps close to life and practical duties, its object the salvation of the soul, to be effected by the extinction of impure desires through strict asceticism together with knowledge of God. He was a determined opponent of Christianity, and in his trenchant criticism exposed many of its supposed errors and imperfections.

Of his writings the chief are the *Lives of Plotinus and Pythagoras*; *Sententiae*; *De Abstinentia*; and the *Epistola ad Marcellum*, addressed to his wife. There is a complete list in Fabricius's *Bibliotheca Græca*, v., ed. Harless. See the works on the Alexandrian school by Vacherot and Jules Simon, and Zeller's *Philos. der Griechen*, vol. ii.; also the monograph by Bouillet (Paris, 1864).

Porpoise (*Phocæna*), a genus of Cetacea in the family Delphinidae. The species are like dolphins, but have shorter snouts. The Common Porpoise (*P. communis*) is the most familiar Cetacean on the British coasts, especially to the west of Ireland and Scotland. It is found also on all the coasts of Europe from the Mediterranean

Porpoise (*Phocæna communis*).

northwards, on the coasts of North America, and in the Arctic regions. It is one of the smallest of the Cetacea, its average length not exceeding four feet, although individuals may measure six feet in length. The body is spindle-shaped, its greatest diameter being near the triangular dorsal fin. The skin is perfectly smooth, and destitute of hair. The upper surface is black with a bluish shimmer, but the under side is grayish white. There are from forty to fifty teeth in each jaw, not conical, as in most of the Cetacea, but compressed. The eye is small; the opening of the ear is very minute, like a hole made with a pin. The crescent-shaped blow-hole, with the horns of the crescent directed forwards, is situated exactly over the eyes.

The porpoise is gregarious, and large numbers are often seen together, sometimes swimming in file, when their backs, appearing above the surface of the water, suggest the idea of a great sea-serpent; sometimes gambolling in fine weather, or when a

storm is approaching, or even in the midst of a storm. They feed on fish, which the teeth are admirably adapted to catch, and schools of porpoises pursue the vast shoals of herring, mackerel, &c. into bays and estuaries. They sometimes ascend rivers, apparently in pursuit of salmon, as far as the water is brackish, and are not unfrequently caught on such occasions. The skin, the oil, and the flesh are all useful. The skin is nearly an inch thick, but is planed down until it becomes translucent, and is made into excellent leather, which is used for covering carriages and for other purposes. But much 'porpoise' leather is obtained from the Beluga (q.v.), or white whale, whence come also the so-called 'porpoise laces.' Under the skin is a layer of fat, about an inch in depth, which yields oil of the finest quality. The flesh was in former times highly esteemed, and reckoned fit for the table of royalty, perhaps partly because among Roman Catholics it was accounted *fish*. In the time of Queen Elizabeth it was still used by the nobles of England, and was served up with bread-crumbs and vinegar. It is now used only in very northern regions. An entirely black Porpoise (*P. melas*) from Japan has no dorsal fin and only seventy-two teeth in all. The name porpoise is from the old French *porpeis*, from the Latin *porcus*, 'hog,' and *piscis*, 'fish,' corresponding therefore in meaning to the modern French *marcassin*, a corrupt form of the German *meerschwein* ('sea-hog').

Porpora, NICCOLA, musical composer, was born at Naples, on 19th August 1686, trained there in music, and, having produced some successful operas, was appointed master of the conservatorio of San Onofrio (1722). Shortly before that he had established a school for singing, from which came some of the greatest singers the world has known, as Farinelli, Caffarelli, Salimbene, and Uberti. From 1725 to after 1755 he led an unsettled life, though he stayed some time at Dresden, at Venice, in London (with Farinelli, 1734-36), and in Vienna, composing music, chiefly operas (though none rises above the level of conventional respectability), and teaching singing; at Vienna he taught Haydn. Of his other musical compositions a series of cantatas (twelve published in London in 1735), several sonatas for the violin, and six fugues for the clavicord are written with considerable freshness. He died at Naples in 1766 or 1767, and now is chiefly known through George Sand's *Consuelo*.

Porridge, a highly nutritious kind of food made by boiling oatmeal in water, formerly at least one of the chief elements of diet of the Scottish peasantry. Besides oatmeal, porridge may be made of barley, beans, or the like, and instead of water milk may be used.

Porriço. See FAVUS, and RINGWORM.

Porsena. See ETRURIA. The story of the defence of the bridge across the Tiber at Rome against Laus Porsena of Clusium in the time of Tarquin has been told in spirited verse by Macaulay in his *Lays of Ancient Rome*.

Porson, RICHARD, perhaps our greatest Greek scholar, was born on Christmas Day 1759, at East Ruston in Norfolk, where his father was parish clerk. The Rev. T. Hewitt, curate of the parish, noticing the boy's omnivorous appetite for books and his marvellous memory, had him educated along with his own sons, and brought him under the notice of a neighbouring squire, Mr Norris, the founder of the Norrisian professorship at Cambridge, who sent him to Eton in August 1774. Here he remained four years, and in 1778 was entered at Trinity College, Cambridge, mainly by the help of the physician Sir George Baker. He was elected a scholar in 1780, next year won the Craven Scholarship, and subsequently the first

chancellor's medal. In 1782 he was elected a Fellow of Trinity. He now began to contribute to *Maty's Review*, his first critique being on Schütz's *Æschylus*, and his finest on Brunk's *Aristophanes*. He also opened a correspondence with the veteran scholar David Ruhnken of Leyden. His *Notæ breves ad Toupit Emendationes in Suidam* (1790) first carried his name beyond England as a scholar of the highest rank. In 1787 appeared in the *Gentleman's Magazine* his three sarcastic letters on *Hawkins' Life of Johnson*; and during 1788 and 1789, in the same periodical, his far more famous and trenchant *Letters to Archdeacon Travis, on the Spurious Verse 1 John v. 7* (coll. 1790)—'the most acute and accurate piece of criticism since the days of Bentley,' says Gibbon. Porson naturally incurred great odium on account of the side which he took in this controversy, and it is said that one old Norwich lady, who had him in her will for a legacy of £300, cut it down to £30 when she heard that he had written a book against Christianity. In 1792 his fellowship ceased to be tenable by a layman, whereupon some friends raised a fund to preserve him from want, and about £100 a year was secured. This he accepted on condition that after his death the money should be returned to the donors, but when they refused to take it back it was used to form a foundation for the Porson prize at Cambridge. He was also appointed to the regius professorship of Greek in the university of Cambridge, an office worth £40 a year. In 1795 he edited the plays of *Æschylus* for the Foulis press at Glasgow, and between 1797 and 1801 four of Euripides, the *Hecuba*, the *Orestes*, the *Phœnissæ*, and the *Medæa*. He also collected the Harleian MS. of the *Odyssey* for the Grenville *Homæ*. He married in 1796, but his wife died five months later, too soon to cure him of his dilatory and slovenly habits and his thirst for drink. In 1806 he was appointed librarian of the newly-founded London Institution, with a salary of £200, but neglected his duties. He was suddenly struck down with apoplexy in the Strand, 19th September 1808, and died six days later. He was buried in the chapel of Trinity College, Cambridge. Porson possessed a stupendous memory, unwearied industry, great acuteness, fearless honesty, and masculine sense, but was hindered all his life by poverty, ill-health, dilatoriness, and fits of intemperance. With all his powers he achieved but little, and to justify contemporary admiration there remain, besides the works already named, but a few *bons-mots*, some brilliant emendations, the posthumous *Adversaria* (1812), and notes on *Aristophanes* (1820), the lexicon of Photius (1822), *Pausanias* (1820), and *Suidas* (1834). His *Tracts and Criticisms* were collected by Kidd (1815).

See 'Porsoniana' in Rogers's *Table-Talk* (1856), H. R. Luard in *Cambridge Essays* (1857), and the Rev. J. Selby Watson's *Life* (1861). His *Correspondence* was edited by Luard for the Cambridge Antiq. Soc. (1867).

Port. See STEERING; also PORT WINE.

Porta. GIAMBATTISTA DELLA (1543-1615), Neapolitan physician, wrote numerous works on physiology, gardening, arboriculture, pneumatics, and refraction, besides several comedies; his best-known books being *Magia Naturalis* (1569) and *De Humana Physiognomia*.—For Baccio della Porta, see BARTOLOMEO.

Port Adelaide. See ADELAIDE.

Portadown, a market-town of Armagh, Ireland, on the Bann, 6 miles S. of Lough Neagh and 25 miles by rail SW. of Belfast. It is a place of considerable trade in agricultural produce, and manufactures linen, caubric, and sheeting. Pop. 11,700.

393

Portage, capital of Columbia county, Wisconsin, is at the head of navigation on the Wisconsin River, and on the ship-canal which connects it with the Fox River, 37 miles N. of Madison. Portage trades in grain, and has hosiery and iron-works, &c. Pop. 5600.

Portage la Prairie, the market-town of a rich agricultural district in Manitoba, on the Assiniboine River, 56 miles by rail W. of Winnipeg. It has flour-mills and grain-elevators, railway shops, brick-yards, &c. Pop. 6800.—In North America *portage* means a place where boats or canoes have to be carried past rapids or across from one navigable stream to another.

Portalis, JEAN ÉTIENNE MARIE (1745-1807), jurist, practised law in Paris, was imprisoned during the Revolution, but under Napoleon was chief author of the *Code Civil*. See CODE.

Portal vein. See LIVER, CIRCULATION.

Portarlinton, a market-town of Ireland, partly in King's County, partly in Queen's County, on the Barrow, 44 miles by rail SW. of Dublin. It was granted by Charles II. to the Earl of Arlington; and here William III. planted a colony of French and Flemish Protestants. Pop. 2000.

Port Arthur, a city of Texas, on Sabine Lake, 20 miles SE. of Beaumont, is an oil-refining and shipping centre, in a rice-growing district; pop. (1900) 900; (1920) 22,251.

Port Arthur, the terminus of the eastern division of the Canadian Pacific Railway, on Thunder Bay, Lake Superior, 993 miles WNW. of Montreal; pop. 15,000.

Port Arthur, by the Chinese called LU-SHUN-KOW, a fortress and port on the Manchurian peninsula of Liao-tung, stretching south into the Gulf of Pe-chi-li, opposite that of Wei hai-wei, on the Shantung promontory to the south. The English name is derived from a naval lieutenant on a ship engaged in surveying here in 1860. The port, which had been fortified and provided with docks by German engineers, was taken by the Japanese in 1894; and in 1898 it and Ta-lien-wan (Dairen), on the east coast of the peninsula, were 'leased' to Russia. The ice-free harbour, surrounded by rocky hills, and with a very narrow entrance, was deepened by dredging and blasting. Docks, barracks, and warehouses had been built, and the place, elaborately fortified, became a great Russian naval station, and a terminus of the Manchurian section of the great Trans-Siberian Railway. The war of 1904 began (8th February) with the successful Japanese attack by torpedoes on the Russian fleet in the outer harbour; in June the town was invested by Nog's troops, while at sea it was blockaded by Togo; in spite of stubborn resistance by the Russians under Stoessel, the Japanese by desperate valour, and at fearful sacrifices, took defence after defence; and on 2d January 1905 the place surrendered. See DAIREN, JAPAN.

Port-au-Prince, the capital of Hayti (q.v.), on a large bay on the west of the island, has an excellent harbour. Pop. 125,000, mostly negroes.

Port Darwin, a magnificent landlocked deep-water harbour of the Northern Territory of Australia. Darwin, or Palmerston, the chief town and port on its shores, is the terminus of the overland telegraph, 2230 miles from Adelaide, and of the cable to Java, and the starting-point of a railway (200 miles) to Emungulen. Extension to Daly Waters (365) has been authorised by the Commonwealth, which, in taking over the territory, undertook to connect Darwin with Adelaide. Pop. 2600.

Porte, SUBLIME. See CONSTANTINOPE.

Port Elizabeth, a seaport of the Cape Province of the Union of South Africa, founded in 1820, stands on the western shore of Algoa Bay, by rail 85 miles S.W. of Graham's Town and 350 S. of Kimberley. It is the principal seaport for the east part of the Cape Province, and also of the Orange Free State. Its public buildings, solid and substantial edifices, are the town-honse, the provincial hospital, churches, the Grey Institute, a college, a library, a museum, &c. There are parks and tree-planted squares. The harbour is under the Harbour and Railway Board of the Union. A great outer harbour was begun in 1922. An aqueduct, 28 miles long, has brought good water to the town since 1878. Pop. (1875) 13,049; (1921) 46,094 (one-half white).

Porteous Mob. At Pittenweem in Fife, on the night of 9th January 1736, three smugglers, Andrew Wilson of Kirkcaldy, George Robertson, an Edinburgh innkeeper, and William Hall, robbed the Kirkcaldy excise-collector of over £100. All three were at once arrested, and on 11th March were sentenced to death. In an attempt to break out of the Edinburgh Tolbooth (the 'Heart of Midlothian'), Wilson, 'a squat round man,' stuck fast in a grating, preventing also the escape of Robertson; but the following Sunday, being taken with him to hear the condemned sermon in St Giles' Church, he suddenly seized two of the four soldiers guarding them, and fastened with his teeth upon a third, at the same time crying, 'Run, Geordie, run for your life.' Robertson did get clear off; Wilson on 14th April was hanged in the Grassmarket. There was some disturbance and stone-throwing, when Captain John Porteous, the brutal commander of the City Guard, fired on the crowd, and killed or wounded sixteen or more men and women. For this he himself was tried and sentenced to death (20th July), but on 26th August was respited by Queen Caroline. However, on the night of 7th September an orderly mob burst open the tolbooth, dragged Porteous out, bore him, pleading for mercy, to the Grassmarket, and lynched him—hanged him from a dyer's pole, and slashed at him with Lochaber axes. A drunken footman of Lady Wemyss and one other man were tried next year for their share in the riot; but both were acquitted, and none of the ringleaders ever was brought to justice. A bill passed the Lords to disqualify the Lord Provost of Edinburgh from ever again holding office, to imprison him for a twelvemonth, to abolish the City Guard, to raze the Nether Port, and to fine the city in £1500 for Porteous' widow; but only the first and last clauses were carried in the Commons, and these only by a casting vote and after the fiercest opposition from all the Scottish members. Indeed, the Porteous Riot paved the way for the rebellion of the '45.

See vol. xvii. of the *State Trials* (1815); Scott's *Heart of Midlothian* (1818); Roughhead, *Trial of Captain Porteous* (1909).

Porter, a kind of Beer (q.v.) favoured by London porters, hence so called about 1750.

Porter, DAVID, an American naval officer, was born at Boston, Massachusetts, 1st February 1780, the son of a naval officer who fought through the Revolution. He was appointed midshipman in 1798, and lieutenant the year after; saw service against privateers in the West Indies, and against Tripoli in 1801-3; became captain in 1812, and captured the first British war-ship taken in the war. In 1813, with the *Essex* (32 guns), he nearly destroyed the English whale-fishery in the Pacific, and took possession of the Marquesas Islands; but in March 1814 his frigate was destroyed by the British in Valparaiso harbour, and Porter returned

home on parole. He afterwards commanded an expedition against pirates in the West Indian waters, and was court-martialled for compelling the authorities at Porto Rico to apologise for imprisoning one of his officers. Porter resigned in 1826, and was for a time at the head of the Mexican navy. In 1829 the United States appointed him consul-general to the Barbary States, and then minister at Constantinople, where he died, 3d March 1843. Farragut, it is worth noting, was his adopted son. See the *Life* (1875) by his son.

DAVID DIXON PORTER, admiral of the American navy, his son, born at Chester, Pennsylvania, 8th June 1813, accompanied his father on his cruise against the pirates, and afterwards was for some time a midshipman in the Mexican service. He entered the United States navy in 1829, was employed on the coast survey from 1836 to 1841, when he became lieutenant, and then served till 1845 on the Mediterranean and Brazil stations, afterwards returning to the coast survey. From 1849 to 1853 he was engaged in command of the California mail-steamer. At the commencement of the civil war he was appointed commander of the steam-frigate *Powhatan*, and ordered to Pensacola; but afterwards he was placed in command of the mortar flotilla, joined Farragut, and in April 1862 successfully bombarded the New Orleans forts. In command of the Mississippi squadron, he assisted to bring about the fall of Vicksburg (July 1863). A rear-admiral, he bombarded and silenced Fort Fisher in December 1864. Till 1869 superintendent of the naval academy at Annapolis, he was made vice-admiral in 1866, and in 1870 succeeded Farragut as admiral of the navy. He died at Washington, 13th February 1891.

He was the author of three romances, of *Incidents and Anecdotes of the Civil War* (1885), and of a *History of the Navy in the War of the Rebellion* (1887).

Porter, ENDYMION (1587-1649), groom of the bedchamber to Charles I., whom he accompanied (with Buckingham) to Spain, and attended on the field during the Civil War. Without actually fighting, it would appear. He was a patron of poets and artists, and wrote many verses. See his *Life and Letters* by Miss Townshend (1897).

Porter, JANE, authoress of *The Scottish Chiefs*, was born at Dunham in 1776, daughter of an army surgeon who died during her childhood. She was brought up at Edinburgh and in London, and made a great reputation in 1803 by her high-flown romance, *Thaddeus of Warsaw*, which was distanced in its kind in 1810 by *The Scottish Chiefs*. The hero of the latter is a stilted and preposterous figure enough—as little of the historical Wallace as could well be. Sir Edward Scarecrow's *No native of his Shipwreck and Consequent Discovery of Certain Islands in the Caribbean Sea* (1831), a clever fiction, edited by her, was almost certainly written by her eldest brother, Dr William Ogilvie Porter (cf. *Notes and Queries*, 1880). With this brother she spent some years at Bristol, and there she died, 24th May 1850.—Another brother, ROBERT KER PORTER (1775-1842), was a clever battle-painter, and led a wandering life. He visited Russia on the emperor's commission in 1804, accompanied Sir John Moore's expedition in 1808, became knight commander of the order of Hanover in 1832, was afterwards British consul in Venezuela, and died at St Petersburg, whither his sister Jane had gone to join him, 4th May 1842. He published books of travel in Russia, Sweden, Spain, Portugal, Georgia, Persia, and Armenia.—Her younger sister, ANNA MARIA PORTER (1780-1832), blossomed precociously into *Artless Tales* (1793-95), followed by a long series of works, among which need only be named *Octavia* (1798), *The Lake of*

Killarney (1804), *The Hungarian Brothers* (1807), *The Recluse of Norway* (1814), *The Fast of St Magdalen* (1818), *Honor O'Hara* (1826), and *Barony* (1830).

Porter, NOAH, philosophical writer, was born 14th December 1811, at Farmington, Connecticut, graduated at Yale in 1831, studied theology, and was for ten years a Congregational pastor. In 1846 he became professor of Moral Philosophy at Yale, and from 1871 to 1886 he was president of the college. His works are numerous. He died 4th March 1892.

Porter, WILLIAM SYDNEY. See HENRY (O.).

Port Erin, a port on the south-west coast of the Isle of Man, on Port Erin Bay, 5½ miles W. of Castletown. Liverpool University Marine Biological Station is there. One mile to the north-east there is an ancient monumental cross.

Port Essington, an inlet in the Colburn Peninsula on the north coast of Australia, forming a fine harbour. On its shores there was from 1831 to 1850 a penal settlement.

Port Famine, the name given by Cavendish in 1587 to a spot in Patagonia on the north coast of the Straits of Magellan. From 1843 to 1853 it was a Chilean penal colony.

Port-Glasgow, a town of Renfrewshire, on the southern shore of the Firth of Clyde, 3 miles ESE. of Greenock and 20 WNW. of Glasgow. It was founded in 1668 by the magistrates of Glasgow as a harbour for their city, the deepening of the Clyde (q.v.) not having yet been thought of. In 1710 it was constituted the head custom-house on the Clyde, and for a while took the lead of Greenock; in 1775 it was incorporated as a municipality; and from 1832 to 1918 it was a parliamentary burgh of the Kilmarnock group. Built on low alluvial ground, and backed by hills 700 feet high, it has a Doric town-house (1805), a public hall (1873), the ruined Newark Castle (1597), a wet-dock (formed since 1834), a large graving-dock (1874), extensive timber-ponds, shipbuilding yards, rope, canvas, and sailcloth works, iron and brass foundries, &c. Pop. (1811) 6938; (1881) 10,802; (1921) 21,022.

Port Hamilton, a spacious, well-sheltered harbour, formed by three islands of the Nan-how group, 30 miles S. of Korea and 45 NE. of Quelart (q.v.). It was annexed by Britain for a coaling station in 1885, but abandoned next year. It was discovered and named by Belcher in 1845.

Port Harcourt, a port of Nigeria on the New Calabar estuary, 25 miles N. of Bonny, is the terminus of a railway to the Udi coalfield.

Port Huron, capital of St Clair county, Michigan, is on the St Clair River where it issues from Lake Huron, and at the mouth of the Black River, 59 miles by rail NNE. of Detroit. The rivers are crossed by iron bridges. The city has a fine custom-house (1877), shipyards and dry-docks, sawmills, grain-elevators, paper-mills, machine and railroad shops and salt works. Much pine timber is brought down by the Black River. A railway tunnel passing under the St Clair River connects the town with Sarnia, in Canada (see ST CLAIR); there is also a steam-ferry to Sarnia, and steamboats ply daily, except in winter, between Port Huron and Detroit. Pop. (1880) 8883; (1890) 13,543; (1920) 25,944.

Portici, a town of Italy, on the slope of Vesuvius, 5 miles by rail SE. of Naples. Its environs are delightful, and are dotted over with country-houses. The royal palace built (1738) by Charles III. is now an agricultural college. There are a small fort, fishing, and sea-bathing. Silk-worms are reared and ribbons made. Pop. 21,500.

Portioners. See HEIR.

Port Jervis, a city of New York, on the Delaware River, 88 miles by rail NW. of New York City. It contains railroad shops, foundries, glass-works, and glove factories, &c. Pop. 10,000.

Portland, (1) the largest city and chief seaport of Maine, and capital of Cumberland county, on Casco Bay, 108 miles by rail NE. of Boston. It is situated on a narrow peninsula, embracing 2½ sq. m., with broad shaded streets, and handsome public and private edifices, including a court and custom-house, post-office, city hall, observatory, and Baxter and Mechanics' Halls. There are shipyards, rolling-mills, canneries; and locomotives, machinery, window-screens, &c., are manufactured. The harbour, which is defended by three forts, is large, deep, and well sheltered; there are wharves, elevators, and dry-docks, and an important trade is carried on; steamers ply direct to Liverpool in winter. The place was first settled by an English colony in 1632. In 1866 a fire destroyed \$10,000,000 worth of property. Portland is the seat of Episcopal and Roman Catholic bishops, and was the birthplace of Longfellow. Pop. 70,000.—(2) PORTLAND, the largest city of Oregon, and capital of Multnomah county, is on the Willamette River, 12 miles from where it joins the Columbia (about 100 miles from the ocean). It is one of the world's chief lumber ports, large ocean-going ships coming up to it. A handsome city, well built with fine, shaded streets, it has a court-house, a United States government building, numerous churches, colleges and schools, and an asylum for the insane. There are iron-foundries, machine-shops, sawmills, flourmills, canneries, and numerous manufactures, including woollen goods, furniture, soap, paper, &c. Founded in 1844, Portland became a city in 1851. Pop. (1870) 8293; (1900) 90,426; (1920) 258,288.

Portland, DUKES OF. See BENTINCK.

Portland, ISLE OF, a rocky peninsula of Dorsetshire, connected with the mainland by the Chesil Bank (q.v.), and 4 miles S. of Weymouth by a branch railway (1865). It is 4½ miles long, 1½ wide, 9 in circumference, and 2890 acres in area. From its highest point, the Verne (495 feet), it shelves with a gradual and almost unbroken slope to Portland Bill. Here a lighthouse (1903-4), 136 feet high, has superseded two old ones (1789-1814). Between the Bill, the southern extremity, and the Shambles, a dangerous reef 3 miles south-east, a surf called the Portland Race is raised by the rushing of the impetuous tides. The cliffs have in places been worn into fantastic caverns; and ancient raised beaches are well marked near the Bill. Portland is one solid mass of oolitic limestone, which has been largely quarried for building purposes since the 17th century, when Hugo Jones employed it for Whitehall and Sir Christopher Wren for St Paul's. Indeed it has been hugely used everywhere in the London district.

There are three different qualities of Portland stone, the three strata lying close together. The top bed, called *Roach*, is unsuited for fine hewn work, since it is full of fossils, but it is hard and durable, and does well for the walls of docks, foundations, and the like. The *Whit Bed*, which comes next, yields the best stone for fine buildings. It varies in texture from a fine close grain to the roe-like structure characteristic of oolitic limestones, and is free from shells. Its colour is a pleasing grayish white. The *Base Bed*, not quite so much quarried as the others, is of finer grain and whiter than the Whit bed; but it is softer and better suited for internal than external architectural work. An analysis of this stone by Professor Daniell shows the following composition: Silica, 1.20; carbonate of lime, 95.16; carbonate of

magnesia, 1·20; iron and alumina, '50; water and loss, 1·94; besides which ingredients there is often a trace of bitumen present. Portland stone is also quarried in the 'Isle' of Purbeck and the Vale of Wardour.

Two great breakwaters (1849-72 and 1893-1904), jointly more than 4 miles long, extend one from the 'Isle', the other from the Nother, and encircle the harbour and roadstead (see BREAKWATER); and there are formidable fortifications. Other features of the 'Isle' are its great Borstal institution, till 1921 a convict prison, dating from 1848; Portland Castle (1520), built by Henry VIII., and held for Charles I. till 1646; Bow and Arrow Castle, ascribed to Rufus; and Pennsylvania Castle (1800), built by Governor Penn, the great Quaker's grandson. The inhabitants of the 'Isle' long remained a peculiar people, intermarrying, and preserving, generation after generation, the many curious customs of their forefathers. The 'Isle' itself is remarkable for its copious and excellent spring-water and for its small breed of black-faced sheep, whose flesh, well known as 'Portland mutton', is much esteemed for its flavour. Pop. of Portland urban district (1911) 17,011; (1921) 12,434.

Portland Beds. See JURASSIC SYSTEM.

Portland Cement. See CEMENT.

Portland Sago. See ARUM.

Portland Vase, a celebrated ancient Roman glass vase or cinerary urn found during the pontificate of Urban VIII. (1623-44) in a marble sarcophagus (of Alexander Severus, it is thought, and his mother Mamaea) in the Monte del Grano, near Rome. It was at first deposited in the Barberini Palace at Rome, and hence it is sometimes called the Barberini Vase. It was bought in 1770 by Sir William Hamilton (q.v.), and in 1787 by the Portland family, who in 1810 deposited it in the British Museum. The ground is of dark-blue glass, and the figure-subjects which adorn it are cut in cameo style in an outer layer of opaque white glass. The vase was broken to pieces by a lunatic in 1845, but the fragments were very skillfully united again. It is 10 inches high, and is the finest specimen of an ancient cameo cut-glass vase known.

Portland Vase.

layer of opaque white glass. The vase was broken to pieces by a lunatic in 1845, but the fragments were very skillfully united again. It is 10 inches high, and is the finest specimen of an ancient cameo cut-glass vase known.

Port Louis, the capital and principal port of Mauritius, on an excellent harbour on the north-west coast, is enclosed by a ring of lofty hills. It is defended by forts (1887-91), is a coaling station of the British navy, and has graving-docks, a Protestant and a Roman Catholic cathedral, a royal college, &c. Pop. 50,000.

Port Mahon. See MAHÓN.

Port Moody. See VANCOUVER.

Port Moresby, capital of Papua, on the south coast, 330 miles ENE. of Cape York, is named after Admiral John Moresby (1830-1922), who explored the New Guinea coasts. Copper occurs in the district. Pop. 2000.

Porto Alegre, capital of the Brazilian state of Rio Grande do Sul, stands at the north-west extremity of the Lagoa dos Patos, by means of which it communicates with the sea. It was

founded in 1742, is well built, and has about 180,000 inhabitants. It contains a presidential palace, an archiepiscopal cathedral, an arsenal, colleges, and a German club. Germans are numerous. The port has been made accessible to ships of moderate size.

Portobello, a Scottish watering-place on the southern shore of the Firth of Forth, 3 miles E. of Edinburgh. Its first house (1742) was built by one of Admiral Vernon's seamen in the expedition against Puerto Bello, and hence it derived its name; but it dates, like its eastern extension Joppa, almost wholly from a time later than 1804. An esplanade skirts the broad level sands. There are public baths, an electric power station, manufactures of bricks, bottles, stoneware, &c. Portobello, with Leith and Musselburgh, returned one member to parliament. Pop. (1841) 3587; (1911) 11,037. By the Edinburgh Extension Act (1896) it was incorporated municipally with Edinburgh, and in 1918 became with Musselburgh part of the east division of Edinburgh parliamentary burgh.

Portobelo, formerly PUERTO BELLO, a decayed seaport of Panamá, on the northern shore of the Isthmus of Panamá. It has an excellent harbour, discovered by Columbus in 1502, but has fallen into decay since 1739, when it was stormed by Admiral Venon.

Porto Ferrajo. See ELBA.

Port of Spain, capital of Trinidad (q.v.).

Porto-Maurizio, capital of a North Italian province, stands embowered in olive-groves on the Gulf of Genoa, by rail 69 miles SW. of Genoa, and 41 E. by N. of Nice, and consists of an old town on the hills and a new town next the sea, with a small harbour; pop. (1921) 8337. It now forms one commune with Oneglia, under the name of Imperia (pop. 15,530).

Porto Novo, a small port on the Comorandul coast of India, 145 miles S. of Madras by rail. Both the Dunes and the Dutch had formerly a factory here. The place is celebrated for the battle of 1st July 1781, when Sir Eyre Coote, with 8000 men, defeated Hyder Ali with 60,000.

Porto Rico, or PUERTO RICO, a West India island (Spanish till 1898), lies 75 miles E. of Hayti or St Domingo. An oblong in shape, it has an area of 3530 sq. m., about five-sixths the area of Jamaica, and measures 110 miles from east to west, and 40 from north to south. It is traversed from east to west by ranges of mountains, 1500 feet in average height, though El Yunque rises almost to 5000 feet. From the base of the mountains rich alluvial tracts extend to the sea on all sides, and are watered by innumerable short streams. The higher parts are covered with forests. Rain falls in much greater abundance on the north than on the south of the island. The principal crops are sugar, coffee, rice (the food of the people), and tobacco. Maize, yams, bananas, plantains and tropical fruits are also grown. Large herds of cattle and horses are fed on the lowland pastures. The exports are sugar, coffee, lumber, tobacco, and cattle. The population increases rapidly: in 1800 it was 155,400; in 1834, 358,800; in 1880, 754,313; and in 1920, 1,299,809 (948,709 being white). Chief towns are San Juan (71,000), the capital, and Ponce (42,000). Porto Rico was discovered by Columbus in 1493; Ponce de Leon founded a settlement in 1510. A rising against Spain in 1820-23 failed. Porto Rico was ceded to the United States as a result of the war (1898), and in 1900 an act of congress conferred civil government on the island. See K. Mixer, *Porto Rico* (1926).

Portpatrick, a village in Wigtownshire, 7½ miles SW. of Stranraer by rail. It is sheltered by high cliffs, but the coast is rocky and the sea

boisterous. Portpatrick is but 2½ miles direct north-east of Donaghadee in County Down, was long the Gretna Green for Ireland, and the chief place for the importation into Scotland of Irish cattle and horses, while it was a mail-packet station from 1662 till 1849. A pier was built in 1774, and a great harbour begun from Rennie's designs in 1821, but public confidence received its death-blow from the wreck of the *Orion* steamship in the port in 1850, within a few yards of the crowded street, and the harbour-works fell quickly into hopeless ruin, after having cost the country £500,000. Pop. 500.

Port Phillip, the gate of Melbourne, discovered in 1802 by Lieutenant Murray, and named in honour of Captain Phillip, the first governor of New South Wales (q.v.). Victoria itself was originally called the district of Port Phillip.

Portraits, COMPOSITE, a method of indicating the facial characteristics of a family or group of persons, while at the same time suppressing the peculiarities of individual members. Sir Francis Galton thus prepared type faces of considerable value to the student of anthropology. One way of obtaining them is to take full-face photographs of each person composing the group, of such a uniform size that two fixed horizontal lines pass, one through the inner angle of the eyes, the other through the line dividing the lips, while a fixed perpendicular line equally divides the nose; the photographs are thus brought approximately to the same size, and like portions of the faces occupy like positions. In printing from, say, ten negatives, each negative is placed in position for one-tenth of the time required for an ordinary photograph.

Portree. See SKYE.

Portreeve, once the English name of the principal magistrate in a port town, especially in London (q.v.).

Port Royal. See JAMAICA.

Port-Royal des Champs, a convent of Cistercian nuns, nearly 8 miles S.W. of Versailles, which obtained much celebrity during the 17th century. It was founded for nuns by a member of the family of Montmorency in the early part of the 13th century, and soon after its establishment obtained from the pope the privilege of receiving lay persons, who, without taking monastic vows, desired to live in religious retirement. The discipline of the convent having been much relaxed in the 15th and 16th centuries, one of its worst abuses—that of appointing the superior, not on account of fitness, but from considerations of family or other worldly or political motives—became in the end the occasion of its complete reformation under Marie Angélique Arnauld (q.v.). The community was removed to Paris in 1626, and in 1633 to a new convent, Port-Royal de Paris; and from this time the old establishment of Port-Royal des Champs was exclusively devoted to the use of a lay community. This community soon numbered among its permanent inmates some of the most distinguished scholars of that age. Their rule of life was most austere. They rose at 3 A.M., devoting many hours to prayer and spiritual reading and instruction, and a portion of the day to manual labour. One of their public services was the establishment of a school, for which they prepared well-known educational books. But Port-Royal is best known for its adhesion to the Jansenist movement (see JANSEN). The nuns of Port-Royal having refused to subscribe the formulary condemning the Five Propositions, a royal order was issued in 1660 for the suppression of the school and the removal of the boarders of Port-Royal des Champs; and the abbess and several other nuns were arrested, and confined as prisoners in other houses. After the

'Peace of Clement IX.' they were permitted to return; but the two communities were placed under separate government. In 1707 a bull was issued by Pope Clement XI. for the suppression of Port-Royal des Champs, and the transfer of its property to Port-Royal de Paris.

Portrush, a watering-place in Antrim, 7 miles W. by S. of the Giants' Causeway, with which it is connected by tramway (1883). The town is built on the isthmus of a short peninsula, looking to the Causeway cliffs on the one side, and to Inishowen and almost Malin Head on the other. Pop. 2100.

Port Said, on the west side of the Suez Canal, on a desolate strip of land between Lake Menzaleh and the Mediterranean, owes its origin to the Suez Canal (q.v.), being named after Said Pasha, its promoter, and depends wholly on the canal trade, mainly as a coaling station. Pop. (1882) 16,560; (1907) 49,884. The 1917 census coupled Port Said with Ismailia (q.v.); pop. 91,090.

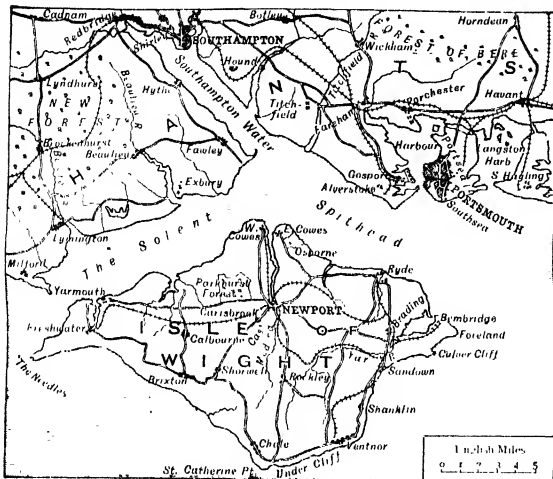

Portsea Island, an island on the south coast of Hampshire, between Portsmouth Harbour and Langston Harbour, separated from the mainland by a narrow channel, crossed by bridges. Four miles long by three broad, it contains Portsmouth (q.v.).

Portside-by-Sea, an urban district 2 miles W. of Brighton, has timber-wharves, brickmaking, extensive gas-works, and Saxon and Roman remains; pop. 7700.

Portsmouth, the chief naval arsenal of Great Britain, and an important seaport, market-town, municipal, parliamentary, and county borough and city (1926) in the south of Hampshire, stands on the south-west shore of Portsea Island (q.v.), at the entrance to Portsmouth Harbour, and opposite the town of Gosport (q.v.), with which it communicates by means of a steam-bridge. The county borough includes Landport, Portsea, Southsea, and Cosham, and returns three members to parliament. Pop. (1821) 69,479; (1871) 113,569; (1921) 247,284. Portsmouth has probably the most complete fortifications in Britain. These comprise on the landward side the outer line of the Portsdown forts and the Hilsea lines, to seaward the Spithead (q.v.) forts. The greater portion of the once imposing bastioned ramparts was removed after 1872; the Camber Bastion and a small section of ramparts and moats near the Governor's Green have been left. Southsea, which is situated on land skirting Southsea Common to the north, is rapidly increasing, and is now a fashionable watering-place. In the town proper there are few objects of note. The Victoria Park was opened in 1878, and the town-hall in 1890. Among the few notable buildings may be mentioned the church of St Thomas, selected as cathedral for the new diocese of Portsmouth and Wight; the chancel and transept date from the close of the 12th century, and the nave and tower from 1698; in the chancel there is a ghastly cenotaph in memory of the murdered Duke of Buckingham. The Garrison Chapel, Early English in style, and finely restored by Street in 1867, is a fragment of the hospital of St Nicholas, founded in 1212 by Bishop Peter de Rupibus. In it Charles II. married Catharine of Braganza; and in front of it is buried the brave Sir Charles James Napier (q.v.), who died in this neighbourhood in 1853. The dockyard of Portsmouth, in the district of Portsea, was till 1872 only 116 acres in extent; but vast works have since then been carried out; and the total dock area, including the two dry-docks added in 1896, is now over 300 acres. Of this immense naval establishment noteworthy features are the mast and rope houses, hemp-stores, rigging-stores, sail-loft, gun and torpedo mounting stores, a torpedo-range, electrical shops, a coaling-wharf with hydraulic appliances, and the dry-docks,

spacious enough to admit the largest vessels, and offering every facility for their speedy repair. The fifteen docks, 22 to 36 feet deep, are lined with

deep harbour, with smooth rock bottom, it is a handsome old town, many of its streets lined with shade-trees, and is a favourite summer-resort. It

solid masonry, roofed over, and closed by lock-gates. The dockyard contains the residences of the superintending officers, and a school of naval architecture.

Portsmouth Harbour, about 400 yards wide at its entrance, expands into a spacious basin, extending inland for about 4 miles, and having a breadth of 3 miles along its northern shore. Large war-vessels can enter and lie at anchor at all times of the tide, there being 4 fathoms of water in the channel at low water. The outward entrance is defended by Forts Moulton and Gilkicker, and Southsea Castle. The position of this harbour is highly favourable. It is situated in the middle of the channel, close to the magnificent anchorage of Spithead, where 1000 ships of the line may ride without inconvenience, and is under shelter of the Isle of Wight, and opposite the French arsenal of Cherbourg. The local trade of Portsmouth is chiefly supported by the dockyard and other public establishments. Brewing is largely carried on.

The importance of this port dates only from the reign of Henry VIII. Its defences were commenced by Edward IV and strengthened by Elizabeth, and afterwards in a more thorough manner by William III. Here, in a house that still remains in the High Street, and which was then an inn called the 'Spotted Dog,' the Duke of Buckingham (the 'Steenie' of King James) was assassinated by John Felton. On the 29th of August 1782, when its commander, Admiral Kempenfeldt, was writing in his cabin, the *Royal George* went down at Spithead, and nearly 1000 lives were lost. Charles Dickens was born at 387 Mile End Terrace, Commercial Road, Landport, Portsea; other worthies of Portsmouth have been George Bentham, Sir Walter Besant, the younger Bunsell, Jonas Hanway, Sir Frederick Madden, George Meredith, and John Pounds.

Portsmouth. (1) the metropolis and only seaport of New Hampshire, is on the south bank of the Piscataqua River, 3 miles from the Atlantic, and 57 miles by rail NNE. of Boston. Built on a beautiful peninsula, overlooking a capacious and

has a custom-house, and some shipbuilding is still carried on; the manufactures include cotton, hosiery, shoes, and iron castings. At Kittery, on an island opposite, is a large United States navy-yard. Portsmouth was settled in 1623, and was capital of the state till 1807. Here, in 1905, peace was concluded between Japan and Russia. Pop. 13,600. (2) Capital of Scioto county, Ohio, stands among hills in an iron region, on the Ohio River, at the mouth of the Scioto, and at the south terminus of the Ohio Canal, 106 miles by rail ESE. of Cincinnati. It has several iron-foundries, rolling-mills, sawmills, railroad shops, and manufactures stoves, steel springs, furniture, machinery, shoes, &c. Pop. 33,000. (3) An important city and port of Virginia, on the Elizabeth River, opposite Norfolk (q.v.). Portsmouth has an excellent harbor and United States navy-yard, large railway workshops, and exports iron, lumber, cotton, and early vegetables, &c. Pop. (1900) 17,427; (1920) 54,387.

Portsmouth, DUCHESS OF. See CHARLES II

Portugal, a republic of Europe, on the west side of the Iberian Peninsula, stretches 350 miles between 36° 59' and 42° 8' N. lat., and varies in width from 70 to 140 miles between 6° 10' and 9° 31' W. long. Its eastern and northern boundaries are Spain, its western and southern the Atlantic Ocean. Details of provincial areas and populations are given in the subjoined table.

Estro
Alen
Algar

The population increases steadily but slowly: in 1851 it numbered 3,487,000; in 1874, 4,160,315; and in 1900, 5,428,659. But fully 70,000 persons emigrate every year, the majority going to America, chiefly to Brazil.

Physical Aspects—Portugal is a part of the Iberian Peninsula (see SPAIN). The coast is low and flat, and sandy, except for one or two short distances, as immediately north and south of the mouth of the Tagus, and at Cape St Vincent in the extreme south-west. The two northern provinces are diversified by spurs (5000 feet) of the mountains of Spanish Galicia. The most important mountain-range of Portugal is the Serra da Estrela (6540 feet), a westward continuation of the Spanish Sierra Guadarrama system. The Sierra Morena is continued westwards in southern Portugal. In like manner, the principal rivers of the country—the Guadiana in the south, the Tagus in the centre, and the Douro and Minho in the north—are simply the lower courses of Spanish rivers. The Mondego, which reaches the sea about half-way between the Tagus mouth and that of the Douro, is the longest river that has its

sources in the country. Portugal has numerous mineral springs, a large proportion impregnated with sulphur. Minerals, fairly abundant, are not worked as much as they could be, chiefly for want of fuel and cheap transit, and also for lack of capital, and heavy taxation. There is a vast amount of water-power undeveloped. Salt is prepared in large quantities in the salt marshes; copper, iron, lead, manganese, antimony, gypsum, lime, and marble are extracted and in part exported.

Climate.—The ocean tempers the climate, and exempts it from the dry heat by which Spain is visited. The inequalities of the surface, however, produce diversities; for, while snow falls abundantly on the mountains in the northern provinces, it is never seen in the lowlands of the south, where spring begins with the new year and harvest is over by mid-summer. Rain falls abundantly all the year round, especially on the coast, and from October to March. As a general rule, the climate is healthy in the elevated districts, even of the northern provinces. The mean annual temperature ranges from 60° F. at Oporto to 63°·5 at Lagos on the south coast.

The animal life and plant life do not differ from those of Spain (q.v.).

Occupations.—The soil is generally rich, except in the mountainous parts, but agriculture, though 60 per cent. of the population take part in it, is everywhere in a backward state, little more than half the area of the country being put to profitable use. The neglect of irrigation and the absence of good roads are severely felt. Cereals and pasture occupy 26·2 per cent. of the area of continental Portugal; vineyards, 3·5 per cent.; fruit-trees, 3·9; forest, 17·3; and waste land, 49·1. The cereals chiefly grown are maize, wheat, rye, barley, and rice, but not enough for the wants of the people. Potatoes, onions and other vegetables, flax, fruits (oranges, lemons, chestnuts, almonds, figs), are much grown. But the cultivation of the vine and of the olive are the most prosperous branches of industry; from the former is derived the rich red wine familiarly known as Port, from its being shipped at *O Porto*, 'the port.' About 100,000 hands are engaged in the vineyards. Cattle are reared in the north, sheep and goats in the centre, and swine in the oak forests of the south. In the vine districts of the north and centre the soil is mostly owned by peasant proprietors; in other parts of the country great estates are owned by landowners and let to tenants to cultivate. Fish is abundant in all the rivers and off the coasts. The tunny and sardine trades are very considerable; oysters are also exported, but to a lesser extent.

Commerce.—Portugal is not a manufacturing country, and the industries are principally concentrated in the two chief towns, Lisbon and Oporto. The wine and cork trades, the fisheries, and weaving form the staple industries. Porcelain tiles, used extensively for interior and exterior decoration, and glassware are manufactured near Lisbon. The merchant marine, which suffered considerably during the Great War, amounted to 100,000 tons in 1918. There are more than 2000 miles of railway. The exports average 7½ million pounds a year, of which one-third is accounted for by wine, and one-fourth by sardines and cork; other exports are fruit, vegetables, and wool. Great Britain is the principal purchaser of Portuguese goods, to the extent of one-fourth of her exports, chiefly wine. The imports average 20 million pounds, of which one-third is accounted for by coal, iron and steel, machinery and textile manufactures; other imports are raw cotton, cod-fish, and hides. One-third of the imports comes from Great Britain, chiefly coal, cotton goods, and iron. The other

principal countries doing business with Portugal are the United States, France, and Brazil.

Finance.—The financial arrangements of Portugal have never been good, and there is almost invariably a deficit, which is mostly met by loans, so that the national debt rapidly increases. The chief sources of revenue are customs duties and the taxes on land and industries, but one-fourth of the expenditure is devoted to paying the interest on the national debt.

Defence.—Every Portuguese male between the ages of seventeen and forty-five is liable for military service: ten years in the active army, ten in the reserve, and eight with the territorials, though exemption could be obtained by payment. The annual contingent is fixed at different intervals by the legislative power. The peace footing of the army embraces about 26,000 of all ranks, and the war strength anything up to 200,000. The small navy is manned by some 6000 men.

Religion, Education.—Since the revolution and the deposition of King Manoel, anti-clerical influence has been all powerful, and in 1910 church and state were separated. There are three ecclesiastical provinces presided over by the Patriarch of Lisbon, the Archbishop of Braga, who is primate of Portugal, and the Archbishop of Evora. The monasteries were dissolved in 1834, their properties appropriated by the state; and monks and nuns were expelled in 1910. In 1917 the law of separation was somewhat modified, and diplomatic relations were resumed with the Vatican. There is freedom of worship for all, but 90 per cent. of the population are Roman Catholic. Compulsory education was enacted in 1844, but is far from being fully enforced; in 1920 there were 4 million illiterates (including children) out of a population of 6 million. The university at Coimbra (1291) is one of the oldest in Europe; Lisbon is the centre of different academies, many learned societies, and has a university, and an important library (1796); and Oporto a university.

Constitution.—The revolution of 1910 changed the constitution of Portugal from a constitutional monarchy to a republic. There are 2 chambers, the Lower (164 members) being elected by direct suffrage for three years, and the Upper (71 members) being elected by all the municipal councils, renewable half at a time every three years. The president is elected by both chambers for a term of four years, cannot be re-elected, and receives an annual income, including allowances, of £5300. In 1920 the president obtained the right to dissolve parliament, which retains control over taxation. The president appoints the prime minister and the secretaries of state, forming the cabinet, who in their turn are responsible to parliament. Candidates for election to the Lower Chamber must be over twenty-five years of age, and for the Upper Chamber over thirty-five years, while the suffrage is open to all male Portuguese over twenty-one years who can read and write. The republic is strongly anti-clerical, most of its leaders, like its first president, Senhor Braga, being positivists, but the complete separation between church and state roused much opposition. At the end of the Great War the situation became less strained. The republic has abolished all hereditary titles and privileges.

People.—The Portuguese are a mixed race, mainly Mediterranean. Upon the Iberian or Basque came a later Celtic admixture. Galician blood (derived from the ancient Gallaeci, presumably Gallic invaders) predominates in the north; Jewish and Arabic are strongly present in the centre, and African in the south. The Portuguese differ essentially from their Spanish brethren, whom they regard with inveterate hatred and jealousy, mainly

on account of their past attempts to subvert the independence of Portugal. The opinions of observers differ as to the national traits of the people. They seem, however, to be generally sober, good-natured, obliging, and patriotic, but shiftless and dirty. Lisbon, the capital, situated at the mouth of the river Tagus, with a magnificent bay, has a population of 486,372 (1920), and Oporto has 203,091 inhabitants. No other town reaches 38,000.

The colonial possessions of Portugal are enumerated in the subjoined list, though accurate figures are not easily obtainable:

AFRICA—	Area, in sq. m.	Pop.
Cape Verde Islands.....	1,480	149,798
Senegambia (Ginées).....	15,940	289,000
St Thomas and Principe.....	300	58,907
Angola, Ambriz, Benguela, Mossamedes, and Congo.....	484,800	4,119,000
East Africa.....	426,712	3,120,000
ASIA—		
Goa (in India).....	1,469	515,772
Diu, Damão, &c.....	169	32,700
Timor.....	7,380	377,815
Macao (in China).....	4	74,866
Total.....	936,264	8,737,853

Koebel, *Portugal, its Land and People* (1909); A. F. G. Bell, *In Portugal* (1912); and *Portugal of the Portuguese* (1915).

HISTORY.—Romans followed Carthaginians as conquerors (138 B.C.) of the western Iberians and Celts. Under Augustus the peninsula was divided into three provinces, one of which, Lusitania, has, until quite recent times, been regarded as nearly identical with the present kingdom of Portugal; but the Angustan province of Lusitania lay wholly on the south side of the Tagus. The history of Portugal was in early times coincident with that of the Iberian Peninsula as a whole; and, along with the rest of the peninsula, Portugal was thoroughly Romanised in the days of the empire. After the Romans withdrew, the peninsula was overrun by Visigoths from the north, and at a later period by Saracens from the south. Under Roman, Visigothic, and Saracenic rule the people were prosperous and well governed, but became enervated by luxury and unwarlike ease. About the middle of the 11th century northern Portugal fell under the sway of Ferdinand I. of Castile. In 1094 Henry of Burgundy, who had married a natural daughter of Alfonso VI., son and successor of Ferdinand, received from that monarch the county of Portugal (from the Minho to the Tagus) as a dependent fief. Under his widow, Theresa (1114-28) the country acquired a sense of national unity and a certain measure of independence. Their son, Alfonso I., made Portugal an independent kingdom (1143)—through the victory of a picked body of Portuguese knights over a picked body of Castilian knights in a tournament—and gained signal advantages over the Arabs, whom he fought for twenty-five years, his greatest exploits being the victory in the plain of Ourique, in Alentejo, in 1139, the capture (with the help of English crusaders) of Lisbon in 1147, and of Alcaçer do Sal in 1158. The Burgundian House, which continued in possession of the throne for 440 years, gave to Portugal some of its best kings. The immediate successors of Alfonso I. were engaged in incessant wars against the Moslems and in severe struggles with the clergy and nobles, who were always ready to combine against the sovereign; but, although often baffled in their attempts to uphold the independence of the crown, the dignity of the kingdom was, on the whole, well maintained by the representatives of this family, who were, moreover, distinguished as

the promoters and champions of the maritime glory of Portugal. Sancho (died 1211), the 'builder of cities,' especially distinguished himself by his care for the material welfare of his kingdom, and by his bold fight against the claims of Pope Innocent III. and that pope's supporters, the Portuguese bishops. His son, Alfonso II., anointed the first Portuguese Cortes. Alfonso III. (1248-79) conquered the southern province of the kingdom in 1250, and made Portugal what it practically is in area at the present time. His son Diniz (Denis) must be regarded as the founder of Portuguese commerce and mercantile enterprise. He likewise encouraged agriculture and the industrial arts, and protected learning, in furtherance of which he founded in 1300 a university at Lisbon, subsequently transferred to Coimbra. Diniz was succeeded in 1325 by his son, Alfonso IV., surnamed the Brave, whose reign was almost wholly occupied in wars with the Castilians and the Moslems (see CASTILLO, INEZ DE). It was during his reign that the friendly commercial relations with England began.

With Alfonso's grandson, Ferdinand I., the legitimate branch of the Burgundian House became extinct in 1383. After some disturbances Ferdinand's illegitimate brother, John, was recognised by the Cortes as king in 1385; four months later the allied Portuguese and English army won at Aljubarrota a glorious victory over the Castilians, who had invaded the country. John's reign (he died in 1433) was eventful, not merely on account of the internal reforms which he introduced, and of his steady maintenance of the prerogatives of the crown, but chiefly as being associated with the first of those important geographical discoveries and commercial enterprises which made Portugal for a while the greatest maritime power of Europe. During this reign, on May 9, 1386, the treaty of Windsor cemented the firm alliance and national friendship between Portugal and England, that was further confirmed by the marriage of King John to the daughter of John of Gaunt (1387). To John's son, Henry the Navigator (died 1460), is due the merit of having organised several voyages of discovery, which culminated in the acquisition of the Azores, Madeira, Cape de Verde, and other islands. At this time, too, the slave trade began, the Portuguese bringing captive negroes to cultivate the large estates of their southern provinces. During the reign of John II. (1481-95), who broke the power of the feudal nobles, Bartholomew Diaz doubled (1486) the Cape of Good Hope; and Vasco da Gama, in the reign of John's successor, Manuel, successfully achieved the passage by sea to India in 1497. The discovery of Brazil (1500), and the settlements made there and on the western coast of India by Albuquerque (q.v.), increased the maritime power and fame of Portugal, which were further extended under Manoel's son, John III., who ascended the throne in 1521.

At this period Portugal ranked as one of the most powerful monarchies in Europe, and Lisbon, the great distributing centre of the products of the East, as one of its most important commercial cities. Sudden as this prosperity had been, its decline was almost more abrupt, and may in a great measure be accounted for by the destruction of the old nobility, the extensive emigration that went on to the new colonies, the expulsion of the numerous wealthy and industrious Jews, on whose able financial management the commercial interests of the Portuguese were largely dependent, and the introduction of the Inquisition (1536), and of the Jesuits (1540), whose baneful supremacy gave rise to much tyranny and oppression, both in the colonies and at home, and in various ways stamped out the old spirit of the people, and crippled the resources of the nation. The influence of the Jesuits

over John's grandson, Sebastian (1557), was responsible for the defeat of the Portuguese, and the capture and death of their young king, at the battle of Alcazar al-Kebir in Africa in 1578. "And the extinction of the old Burgundian line in 1580, after the brief reign of Sebastian's uncle, Cardinal Henry, plunged the country into difficulties and misfortunes. After a struggle for the throne between half-a-dozen candidates, none of whom found favour with the nation at large—they clung to the delusive hope that Sebastian was still alive, and would return from the hands of his Moorish captors—Philip II. of Spain succeeded in securing to himself the crown of Portugal and annexing the kingdom to the Spanish monarchy. This involved it in the ruinous wars of Spain against England, in the Low Countries, and in Germany, while the Dutch and English, in retaliation for Spanish aggressions at home, attacked and seized the Portuguese possessions in the Indian Archipelago and in South America. At length the insolence of Philip IV.'s minister, Olivarez, brought matters to a crisis; and in December 1640, after a forced union of sixty years, Portugal was freed, by a bold and successful rising of the nobles, from all connection with Spain, and the Duke of Braganza, a descendant of the old royal family, was placed on the throne (1641), under the title of John IV. The war with Spain, which was the natural result of this act, turned out, under the guidance of the famous Count Schomberg (who fell at Boyne battle, 1690), and with the assistance of 3000 English troops, favourable to Portugal, and was terminated in 1668 by the treaty of Lisbon, by which the independence of Portugal was formally recognised by the Spanish government. But her ancient glory had departed; she had lost many of her colonies, and of those she still retained Brazil alone was prosperous; the nation was steeped in ignorance and bigotry; and the Portuguese, from having been one of the greatest maritime powers of Europe became virtually a commercial dependant, rather than ally, of Great Britain, especially after the Methuen (q.v.) Treaty of 1703. Under the reign of Joseph I. (1750-77) the genius and resolution of the minister Pombal (q.v.) infused temporary vigour into the administration, and checked for a time the downward tendency of the national credit. But Pombal's efforts to rouse the people from their sloth, and infuse vigour into the government, were checked by the accession of Joseph's daughter, Maria, who, with her uncle-husband, Pedro III., allowed things to turn back into their old channels. The mental alienation of Maria led, in 1799, to the nomination of a regency under her eldest son, John. This prince, who showed considerable capacity in early life, on the outbreak of the war between Spain and France threw himself wholly on the protection of England; and finally, when he learned that Napoleon had determined on the destruction of his dynasty, left Portugal in 1807 and transferred the seat of government to Rio de Janeiro, the capital of Brazil (q.v.).

This act was immediately followed by the occupation and annexation of Portugal by the French—a measure which gave rise to the Peninsular War (q.v.). The victory of Vimeira, gained by the combined English and Portuguese army in 1808, freed the land from its French assailants; and in 1816, on the death of Queen Maria, the regent succeeded to the joint crowns of Portugal and Brazil. But even after the French were driven out of the Peninsula and Napoleon's power was broken for ever, the new king, John VI., still continued to reside at Rio de Janeiro, leaving Portugal to be governed by English officers, Marshal Beresford and others. This gave occasion to abuses and discontent, which resulted, in 1820, in a revolution at Lisbon, and in the proclamation of a constitutional form of

government, very democratic in spirit, in the place of the pre-existing feudal absolutism. John hurried to Portugal, and there signed the constitution and ratified the independence of Brazil, which proclaimed his son Pedro emperor. On the death of John in 1826, Pedro IV., after organising the government of Portugal on the model of the English parliamentary system, renounced the Portuguese crown in favour of his daughter, Maria da Gloria, a child of seven, on condition that she married her uncle, Miguel. The latter, who had availed himself of every opportunity to thwart the liberal policy of his father and brother, waited only for the embarkation of the English troops to break the oath which he had taken to maintain the constitution, and, gathering round him the clergy, the army officers, the old nobility, and all who were in favour of the former order of things, was through their aid declared king by the Cortes in June 1828.

Then ensued a period of indescribable confusion and misrule. At length, in 1832, Pedro was enabled, chiefly by means of a loan from Englishmen, to raise an army, and make a landing at Oporto. Charles Napier virtually destroyed Miguel's fleet off Cape St Vincent in 1833. Shortly afterwards Queen Maria made her entry into Lisbon; and in the following year Miguel signed the Convention of Evora, by which he renounced all pretensions to the throne, and agreed to quit Portugal. The death of Pedro in the same year, after he had effected several important reforms, including the reintroduction of the constitution of 1826, proved a heavy misfortune to Portugal, which suffered severely from the mercenary rule of those who occupied places of trust about the person of the young queen. Her marriage, in 1835, with Augustus, Duke of Leuchtenberg, and, after his death at the end of a few months, her marriage with Ferdinand of Saxe-Coburg, were followed by grave political disturbances. A branch of the democrats, known as the Septembrists, from the month in which they made their first decisive stand against the government, loudly demanded (1836) the abrogation of the charter promulgated by Pedro (known as the Charter of 1826), and the restoration of the democratic constitution of 1824. This contest of the charters continued through the entire reign of Maria, and party feeling ran so high that it resulted more than once in hostilities. The government was alternately in the hands of Septembrists and Chartists; one Cortes was dissolved after another; finally, in 1852, a revised charter was drawn up that proved acceptable to all parties. Shortly afterwards the queen died, and her eldest son ascended the throne in 1853 as Pedro V., under the regency of his father. The latter used his power discreetly; and by his judicious management the financial confusions and embarrassments were partially removed. Upon the sudden death of Pedro in 1861 his brother was proclaimed king as Luis I., but the financial condition went from bad to worse, and the royal power grew weaker and weaker. Charles I. succeeded his father in 1889, and in the same year the establishment of a republic in Brazil gave an impulse to republicanism in Portugal. In 1889 also Britain compelled Portugal to abandon her claim to Nyassaland; further delimitations in 1891 provoked bitter feelings against Britain, and anti-foreign demonstrations became anti-dynastic. Financial embarrassment increased, corruption was rampant, court expenditure extravagant, monopolies were monstrous, taxation ruinous. Two political parties, Progressistas and Regeneradores, arranged to divide the spoils between them, though reforms were proposed, the king made some sacrifices, and

the army, was slightly reduced. When Senhor Franco had by degrees secured power and, supported by the king, aimed at reform by a practical dictatorship (1905), popular discontent culminated in the assassination of the king and his eldest son in the streets of Lisbon in February 1908. His second son, Manoel, succeeded. Franco withdrew from Portugal, and some concessions were announced. But a parliamentary committee revealed a wholesale system of plundering the treasury, by which large sums had been made over to King Carlos and the royal family and to the bureaucracy. In 1910 the murder of Dr Bombarda, a republican, hastened on a revolution already arranged for. The army and navy assisted in deposing Manoel and setting up a Provisional Government, with Dr Braga as President of the Republic. Subsequent history has been stormy. Financial embarrassments have continued with an ever-increasing national debt, the government never being strong enough adequately to tax war-profits, or to reduce the bureaucracy. Royalist risings, though on a small scale, have been frequent, and there have been several alarming industrial crises. In 1915, 1917, and 1918 disorders in Lisbon between the Radicals and Liberals ended in bloodshed. In 1914 the government was authorised to intervene in the Great War as Britain's ally; and in 1916 Germany declared war on Portugal. The attempt of Dr Paes to form a ministry on national lines as opposed to the party-ministries of the Democrats was cut short by his assassination in 1917. The republic had its first stable government under Dr de Silva in 1922-23. The absence of a firm and guiding hand has been much felt in Portugal, and General Gomes da Costa in June 1926 unsuccessfully sought to emulate the dictators of Spain and Greece.

LANGUAGE AND LITERATURE. — Portuguese, like every other branch of the Romance family of languages, has grown out of a local form of the *Lingua Romanica Rustica*, and in course of time has had grafted upon it many elements of Arabic from the Saracen invaders, and numerous verbal and idiomatic characteristics of the Frankish and Celtic dialects which were introduced with the Burgundian founders of the monarchy. The earlier forms of Portuguese bore close affinity to Galician; and, although Portuguese presented strong resemblance to its sister-language, the Castilian, in so far as both possessed numerous words of identical origin, it differed so widely from the latter in regard to grammatical structure as almost to merit the designation of an original tongue. The antipathy existing between the Portuguese and Spaniards, and the consequent strenuous efforts of the best writers among the former to keep their language distinct, and to resist the introduction of further Castilian elements, had the effect of making Portuguese still more dissimilar from the sister-tongues of the peninsula, and the result has been a language that differs from pure Spanish in having an excess of nasal sounds and fewer gutturals, with a softening or lisping of the consonants, and a deepening of the vowels, which renders it the softest, but feeblest, of all the Romance tongues. The earliest specimens of genuine Portuguese belong to the beginning of the 13th century, and consist for the most part of collections or books of song (see *CANCIONERO*), which, both in regard to form and rhythm, resemble the troubadour or *minne* songs of the same period. Amongst the writers of these the most outstanding figure is King Diniz,

who, besides being the forerunner of the Portuguese school of pastoral poets, also drew inspiration from the popular songs of his people. In the 14th and 15th centuries, whilst the romances of chivalry were popular and numerous chronicles were written, the best being that of Fernan Lopes (1380-1459), the court continued to be the centre of poetry and art; but Castilian was in greater vogue than Portuguese, which was despised by the numerous royal poets who emulated the example of Diniz, and composed love-songs and moral or didactic poems. Under the culture of these noble bards the poetry of Portugal was weak and effeminate, without the tenderness and pathos which characterised the Spanish verse 'romances' of that age. But the literature of Portugal acquired new vigour with the growth of her maritime and commercial prosperity. The *Cancioneiro Geral* (1516) of Garcia de Resende (1470-1554), which gave a general summary and extracts of the Portuguese poets of the later half of the 15th and beginning of the 16th century, is the first evidence of the change, which is most strongly exemplified in the dramas of Gil Vicente (1470-1536), and in the pastorals and eclogues of Ribeiro (c. 1500) and Sá de Munda (1495-1558; q.v.), whose dramatic imitations of Horace and Terence mark the transition period between the mediæval lyrical and the later classical style. These first attempts at the drama were followed by Antonio de Ferreira's (1528-69) *Ignês de Castro*, the oldest, and still the finest, Portuguese tragedy. But the classical school, whose chief cultivators were the courtiers of Lisbon and the professors of Coimbra, found little favour among the people at large, whose enthusiasm and patriotism were deeply stirred by the discoveries and conquests of the nation in Asia, Africa, and America. The national pride and glory found full expression in the works of Portugal's greatest writer, Camoens (1524-80; q.v.), who, in *The Lusads* (1572), struck out a new path in the domain of epic poetry; while his numerous sonnets, his songs, his dramas, and other poetic productions exhibit a versatility of genius and graceful tenderness which place him in the foremost rank of European poets. Next after Camoens come the epic poets Corte-Real (1540-93), Mousinho de Quebedo, P. de Andrade (1540-1614), Pereira de Castro (1571-1632), and Sá de Meneses (died 1664). To the same period belongs the dramatist Ferreira de Vasconcellos (died 1585).

With Camoens the language and poetry of Portugal reached the culminating point of their development. During the dominion of Spain the Portuguese so far lost all feeling of national independence that they at length renounced their native tongue, and adopted the language of their rulers. With the restoration of political independence, under the sway of the House of Braganza, a reaction took place; but the 17th and 18th centuries produced few Portuguese writers who attained more than an ephemeral and purely local reputation — bombast, and slavish imitation of Spanish and Italian writers, being the predominant characteristics of the Portuguese school of light literature. Some good historical writers belong, however, to this period, as Jacinto Freire de Andrade (1597-1657), whose life of João de Castro, Viceroy of India, still holds its place as a monument of classical Portuguese prose; the great Indian missionary, the Jesuit Father Antonio Vieira (1608-97), whose sermons and letters are regarded as models of style and diction; De Barros (1496-1570), the historian of *The Conquest of the Indies*; Da Faria e Sousa (1590-1649), De Brito (1569-1617), and Brandão (1584-1637), who wrote *Monarchia Lusitana*; A. de Resende (1498-1573); and F. X. de Meneses (1673-1743). During the 18th century

French literary canons and models were slavishly followed by most Portuguese writers of verse, of whom the best known is Da Cruz e Silva (1731-1800). Nascimento (1734-1819) and De Boença (1765-1805), though both rather pedantic, had an enormous influence in reviving a more national thought and style. During the first half of the 19th century Portuguese literature is dominated by two writers; the versatile De Almeida Garrett (1799-1854), who sought to make poetry less artificial and more spontaneous, and at the same time to found a national drama; and the eminent scholar and historian, Herculano (1810-77), whose work is characterised by thoroughness and attention to detail. João de Deus (1830-96), who was inspired by the native soil and popular speech to compose lyrics, simple and natural, and Anthero de Quental (1842-91), who wrote some splendid sombre sonnets, are perhaps the best poets of the century, but Teixeira de Pascoaes (b. 1877), continuing the traditions of *saudade*, has almost a Wordsworthian occupation with nature. Castello Branco (1825-90) poured out novels profusely, all more or less fantastic and sensational, rather in the style of the 18th-century Spanish romances, though the purity of his language is unquestioned. Eça de Queiroz (1843-1900) presents a marked contrast; devoted to realism, almost to the extent of caricature, he fell rather unfortunately under French influences, and his style suffered accordingly. Other names of importance are those of the poets de Castilho (1800-75), Ribeiro (1831-1901), and de Castro (b. 1869), the novelist Gomes Coelho (1839-71), the historian Oliveira Martins (1845-94), and the critic Dr T. Braga (1843-1924), the first president of the republic. Gomes Leal (1849-1921) and Guerra Junqueiro (1850-1923) were the greatest poets of their generation. In 1917 a Chair of Portuguese Language and Literature was founded at King's College, London.

Portugalete, a Spanish seaport 8 miles NW of Bilbao, with a lolly swing ferry, pop. 7600.

Portuguese Man-of-War (*Physalia*), a remarkable genus in the class Ctenophora, in the sub-class Siphonophora.

Physalia utriculus.

colony feeds, is sufficient to

cause intense irritation in those who incautiously test it. The *Physalia* floats for the most part passively, and is occasionally driven to British coasts. An allied genus, *Rhizophysa*, is even more remarkable, with a large float and long stem.

Portulacaceae, a family of dicotyledons, nearly allied to Caryophyllaceae. The species are not very numerous; they are much diffused over the world, and are shrubby or herbaceous, generally succulent, mostly growing in dry places. The flowers are often large and beautiful, but ephemeral. The foliage is bland and insipid. Some species are used as salads and pot-herbs, of which the best known is Purslane (q.v.). The tuberous roots of *Tiglonia tuberosa*, a Siberian plant, are used for food. The genera *Calandrinia* and *Portulaca* furnish some beautiful annuals.

Port Wine (i.e. *Porto* or *Oporto Wine*), a species of Portuguese red wine, defined by formal agreement incorporated in a treaty of 1916, as 'a fortified wine, produced in the Douro region, and exported through the bar of Oporto.' The vine from which it is produced is generally planted on craggy slopes with a southern exposure. The wine, when pure and unadulterated, does not acquire its full strength and flavour till it has stood for some years; but care must likewise be taken that it is not allowed to become too old. The colour of new port wine varies from pale rose to deep red, and changes with age, becoming a deep tawny brown, which is permanent. By far the greater portion of the wine made is mixed with spirit even during the time of fermentation, in order to give the new wine the ripeness and strength which exporters require, and which the wine does not naturally attain till it has stood for some time; the proper colour is also given by a mixture known as *zeropaga*, which is a preparation of elder-berries, molasses, raisin-juice, and spirit. It is an excess of this zeropaga that gives a medicated odour to the inferior sorts of port. The extreme 'headiness' of port is chiefly due to liberal admixture with spirit. The *natural* port wine, with less than 26 per cent. of proof spirit, is wholesome and invigorating. Port wine came into demand about 1700, though it was known in England for a considerable time before. See W. J. Todd, *Port* (1926).

Porus. See ALEXANDER THE GREAT.

Poscharevatz. See PASSAROWITZ.

Poseidon, Greek god of the sea and of water, son of Kronos, brother of Zeus and Pluto. A god, especially of the Ionians, he lost the sovereignty of Athens in contest with Athena, notwithstanding his gift of the horse. The dolphin and the trident are his attributes in works of art. Black bulls were sacrificed to him. The Isthmian Games at Corinth were held in his honour; and the Panionian festival was kept at his temple at Mycale. See Farnell, *Cults of the Greek States*; and NEPTUNE.

Posen (Polish *Poznań*), the westernmost county or voivodship of Poland, composed of the greater part of the former Prussian province of Posen, together with a small area about Bralin taken from Lower Silesia. Area, 10,232 sq. m.; pop. (1921) 1,974,057, of whom about one-sixth were Germans. The Warthe traverses it from east to west, and is navigable throughout the greater part of its course, as is also the smaller Netze. The Vistula touches Posen on the north-east. The region is a continuation of the great plain of north Germany; there are several lakes in the east. Like Pomerania, it is essentially agricultural. Grain, potatoes, and hops are the principal products. The industry is not much developed, being limited chiefly to machinery, cloth, bricks, sugar, and beer, with saw-milling. The Roman Catholic archbishop

of Gnesen and Posen is primate of Poland. The chief towns are Posen (the capital), Gnesen (Gniezno), Bromberg (Bydgoszcz), Lissa (Leszno), and Rawitsch (Rawicz). Posen formed an integral part of Poland till 1772, when, at the first partition, the districts north of the Netze were given to Prussia; to these was added in 1793 Great Poland, except Masovia, the whole being incorporated under the name of South Prussia. In 1807 Posen was included in the duchy of Warsaw; but by the Congress of Vienna it was reassigned to Prussia under the title of the Grand-duchy of Posen. In 1848 the Poles gave the Prussian government considerable trouble. In 1919 Posen was given to Poland, except small strips in the north-west and west, which, with the remnant of West Prussia, went to form the Prussian province of Grenzmark.

POSEN, or Poznań, the chief town of the province, and a fortress, is situated on the Warthe, 158 miles by rail E. of Berlin. One of the most ancient cities of Poland, it became the seat of a Christian bishop in 968, and was the capital of the early Polish dukes. In the 16th century it was an important trading mart, but by the end of the same century had begun to decline. The Prussians made it a prosperous and very pleasant town; it has stately public buildings, regularly built streets and squares, and handsome suburbs. The cathedral, a Gothic pile dating from 1775, has attached to it the 'Golden Chapel' of Count Raczynski, which is adorned with valuable treasures and works of art. Other buildings are the town-house (1508, restored 1913), containing valuable archives; the Raczynski Palace, with a library; the Dzialynski Palace, with archives; and the archiepiscopal palace. There is a provincial museum of antiquities. A university was founded in 1919. The chief manufactures are artificial manures, agricultural implements, furniture, tobacco, &c.; and there are likewise several breweries, distilleries, and flour-mills. Pop. (1875) 60,998; (1890) 69,627; (1900) 117,033; (1910) 156,896; (1921) 169,793, including a great proportion of Germans.

Posidonia. See *PASTTUM*.

Posidonia, a marine genus of Potamogetonaceae (or Naiadaceae) consisting of two species. *P. oceanica* is abundant in the Mediterranean, and rolled masses of its long, ribbon-like leaves are often thrown up by the waves. *P. australis* is found off the Australian coasts. Its fibre has been mixed with wool, but without much success.

Posidonius, a Stoic philosopher, born at Apamea, in Syria, about 135 B.C., who studied at Athens, and settled at Rhodes, whence in 86 he was sent as envoy to Rome. Here he became intimate with Cicero, Pompey, and other conspicuous Romans. He died at the age of eighty-four, leaving works on philosophy, astronomy, and history, of which only fragments have been preserved.

Posilipo (from a villa here called *Pausilypon*, 'Sans-souci,' which at one time belonged to the Emperor Augustus), a mountain on the north-west of Naples, close by the city, from of old a noble site for the villas of wealthy citizens. It is remarkable for the tunnel known as the Grotto of Posilipo, through which the road from Naples to Pozzuoli (anc. *Puteoli*) passes. The grotto varies in height from 20 feet to 80 or more, is 20 to 30 feet wide, and 755 yards long. It is traditionally said to have been made in the reign of Augustus, but is probably earlier. Above the eastern archway of the grotto is the so-called 'Tomb of Virgil.' At the base of the hill anciently stood the poet's villa. During the middle ages the common people believed the grotto to be the work of the poet, whom they regarded as a great magician. Two other tunnels penetrate through

the hill, one to the north of the grotto, 800 yards long, 39 feet high, and 33 feet broad, made for the tramway, and another constructed at the command of Agrippa in 37 B.C., but only discovered in 1812.

Positive Rays, or CANAL RAYS, streams of positively charged particles (atoms and molecules) which escape through a perforation in the kathode of a discharge tube, were turned to use by Sir J. J. Thomson in 1911 for purposes of chemical analysis. The rays directed upon a photographic plate may be deflected by a magnetic field by an amount $y = A \frac{e}{mv}$; and by an electric field by an

amount $x = B \frac{e}{mv^2}$; where A and B are constants

depending on the strength of the fields and the geometrical data of the apparatus, e the charge, m the mass of a particle, v its velocity. These deflections may be arranged at right angles to each other, and we easily deduce $y^2 = \frac{A^2}{B^2} \cdot \frac{e}{m} \cdot x$;

which, if $\frac{e}{m}$ be constant, is the equation of a parabola. It is found, in fact (from examination of the photographic plate), that owing to their different velocities atoms or molecules of like mass and charge are spread out in a parabola. Thus, by enclosing a very small quantity of a gas in a tube it is possible not merely to determine what elements and compounds are present, but by measurement of the parabolas to find their molecular weights. The method is one of extreme delicacy. See Sir J. J. Thomson, *Rays of Positive Electricity* (new ed. 1921).

Positivism, the System of Thought and Life founded by Auguste Comte (1798-1857; q.v.), is defined by him as consisting essentially of a 'philosophy and a polity which can never be discovered; the former being the basis, and the latter the end, of one comprehensive system, in which our intellectual faculties and our social sympathies are brought into close correlation with each other.' He chose the word *Positive* on the ground of its indicating the *reality* and *constructive tendency* which he claimed for the doctrine in its theoretical aspect, while he anticipated that in the future the term would acquire a wider meaning by suggesting also similar ideas in the sphere of feeling and action. The two primary characters of Positivism, the philosophy and the polity, were finally welded into a whole under the conception of a religion, which has for its creed the new synthesis established by the one, and for its practice the scheme of moral and social reorganisation proposed by the other. We may best consider Positivism under these three aspects.

Positive Philosophy. - Comte's primary aim was to put an end to the intellectual and social anarchy which had resulted from the destructive criticism and the revolutionary upheaval of the 18th century, by supplying an interpretation of phenomena which should organise our knowledge of the world, of man, of society, into a consistent whole. Such a universal synthesis must the new philosophy provide to form a sure basis for a new art of life.

Historical analysis revealed to Comte, as a law of mental growth, the progress of all human conceptions through three distinct phases. The primitive stage he called the *theological*; the transition stage, the *metaphysical*; and the final stage, the *positive*. The meanings which he attaches to these words are most concisely explained by Stuart Mill's translation of them into volitional, abstractional, experiential. The transition was effected by the gradual acceptance of the scientific method of induction from observation of phenomena as the only

sound basis of explanation, all inquiry into causes other than phenomenal being finally given up as fruitless. Science, therefore, is the instrument capable of effecting the desired unity; and the problem of the positive philosophy is a threefold one: (1) to bring all knowledge within the sphere of scientific investigation; (2) to extend scientific methods through the whole territory of each division; (3) to co-ordinate the results obtained from the separate sciences, so as to approach an expression of all our knowledge in terms of a single doctrine. All three parts of this problem Comte considered to be in a large degree solved by his *Classification of the Sciences*.

He observed that the several classes of conceptions advanced from the theological to the positive stage with different degrees of facility, and on inquiring into the law of progression he found that the order of emancipation of the various sciences was determined by the degree of complexity and the consequent relations of dependence. A preliminary distinction was made between the abstract and the concrete sciences, the former treating separately of the general laws manifested by all the phenomena of any class, and the latter depending on these and treating of definite objects under the several aspects in which they may be viewed. The concrete sciences, Comte considered, did not yet admit of co-ordination, and he confined his classification to the abstract sciences, which he placed in the following series: (1) Mathematics; (2) Astronomy; (3) Physics; (4) Chemistry; (5) Biology; each of these drawing its data from the preceding science, and adding a new order of conceptions peculiar to itself. This series he found coincident with the sphere of knowledge then supposed to admit of scientific treatment. But there remained the phenomena of human character and society, forming a wide field of inquiry to which positive methods had never yet been applied. Certain tentative efforts had indeed been made to construct a so-called science of history—notably by Montesquieu and Condorcet—but no one before Comte had formulated the principles on which such a task might be accomplished. By his discovery of the methods proper to a rational study of social phenomena, and by his dicta—that owing to the complexity of the conditions involved, the laws of such phenomena cannot be determined *a priori*, but must be inductively observed, and afterwards verified and co-ordinated by deductive application of the general laws of life; that the statal condition of each historical period must be viewed in its totality, as determined by the interaction of the various classes of social factors; that intellectual evolution affords the true measure of social progress—by his enunciation of these and other doctrines Sociology was created and established in the hierarchy as the last and crowning science of the series.

The whole realm of fact was now included in the domain of positive inquiry, and Comte next addressed himself to the task of rationalising the separate departments of knowledge. In the earlier portion of this task his mathematical aptitude ensured him a large measure of success; while in biology he paved the way for further developments by his organisation of the materials then available. His main services, however, in scientific co-ordination were in the department of sociology. Besides the formal constitution which he gave to the new science, his chief substantive contribution was his enunciation of the fundamental law of intellectual development, already referred to as the cardinal doctrine of the positive philosophy. The progress of thought, moreover, from theological to positive conceptions was shown to be coincident with a progression in social action from an aggressive militarism, through a period of defensive attitude,

to the final régime of industrialism. The two series of transitions are mutually dependent, our increasing knowledge of the conditions of our existence and our systematic efforts to modify them naturally reacting on each other.

The main problem of the positive philosophy, the unification of knowledge, was not yet ripe for its final solution in the days of Comte, but his classification of the sciences is regarded by his followers as affording an admirable framework for the theory of evolution advanced at a later date with the claim of supplying this want. Comte was fain to be content with the demonstration of a subjective unity in the subservience of all the sciences to the needs of man.

Positive Polity.—On the basis of the philosophy he had thus established Comte founded a scheme of individual and social conduct. The ethical portion he did not live to complete, but in his elaborate exposition of the art of social politics we have ample insight into his views on what he considered an integral part of his system. We have space here only for a bare outline.

The most complete life must be that which rests on the fullest knowledge. We naturally strive to improve those conditions of our existence which we can affect in the direction indicated by the clearer light of a new synthesis. What, then, are the evils or imperfections of our lot which may be remedied by applying positive philosophy to life? Cosmical laws are wholly beyond our direct influence, and we can only to a limited extent affect the conditions of their action. But in the science of man we ourselves are the factors, and our efforts to modify our environment form the subjective aspect of what is, objectively considered, a law of social development.

Comte believed the first requisite of systematic action to be the recognition of a central intellectual and moral authority dissociated from practical politics, which he proposed to secure by organising a *Spiritual Power*, consisting of philosophers, supported by the state. This class, exerting a purely moral control, yet supreme in all affairs of private and social life in virtue of its natural prestige, would have only an indirect influence on political action. The temporal power should be in the hands of capitalists, the captains of industry—chosen by their own order and naming their successors—who would feel a moral responsibility to the spiritual power, especially when the authority of the thinkers should be strengthened by the support of women and of the working-classes, whose ready adherence to positive principles Comte firmly anticipated. Besides the corrective influence of each of these powers on the other, an efficient check on despotic control on the part of either is provided in the perfect freedom of opinion and expression allowed—a freedom the more valuable that it would rest on a system of scientific and moral education, which it would be one of the chief functions of the spiritual power to direct and enforce.

With the decline of militarism and the growth of industrialism Comte foresaw that political action would in the future be mainly directed on the organisation of labour for the benefit of society at large. No idleness would be permitted; all would be workers. The distinction between the capitalists and the workmen, the rich and the relatively poor, would remain; but the former would be taught to hold their wealth and power as in trust from society to be used for the benefit of all, while the latter would also come to regard themselves as performing public functions, serving society each in his place. These views are substantially similar to such later economic teaching as that of Carlyle and Ruskin in Great Britain.

In the sphere of morals the main office of the spiritual power would be to strengthen the social tendencies of man at the expense of the personal, a process made possible by the development of the affections originally called forth in family life. In the sphere of intellect it should regulate and concentrate the labours of its members, putting an end to the present 'dispersive speciality' of scientific aims, and determining the direction of all intellectual efforts by reference to social needs. In pursuance of the constructive principle of Positivism Comte applies these general doctrines to the immediate future, by propounding a scheme of concerted action for a great Western Republic, embracing the French, English, German, Italian, and Spanish nations—an organisation imperfectly effected by the influence of Feudalism and Christianity.

Positivist Religion.—Such are the creed and the practice of Positivism. But a religion is more than creed and practice; there must be a sentiment, an appeal to the heart, a satisfaction of the feelings. The conception of an object of love and reverence proposed by Comte to succeed the idea of a Deity (whose existence he considered it impossible either to affirm or deny) is that of *Humanity*, regarded as a collective unity, a *great being*, consisting of all the men and women past, present, and to come, whose lives have been or shall be devoted to the well-being and progress of the race. This being, partly ideal yet wholly real, capable of being definitely conceived, and not beyond the reach of our services, would gather round it all our affections for our fellow-men; gratitude and reverence for those whose struggles and achievements in the past have made us what we are; love and sympathy for all around us who are striving after better things; hope and effort for the more perfect life of those yet unborn. Comte looked on the religion of Humanity as fulfilling all the highest aims sought by the religions of the past, and especially as succeeding naturally to Christianity, the historical value of which he thoroughly appreciated as a transitional phase of religious development. The worship of Humanity was to consist in prayer, taking the form of high resolve strengthened by effort after ideal communion with the noble spirits among the dead; and in public commemorations, for the observance of which a calendar was suggested, associating each day of the year with some great name in the roll of mankind, and arranged so as to illustrate the course of human progress. The spiritual power would carry on the traditions of the priesthoods of former religions, preaching self-abnegation as the rule of life that brings the highest happiness, and offering no reward, save a place in the 'choir invisible' of the great and good, whose names are cherished in the hearts of those who follow them, and whose influence will live to the end of time.

Positivism is of too recent origin to be adequately treated except in an account of its genesis, and the above outline of the system has therefore been entirely confined to the works of its founder. In his lifetime Comte attached to himself a body of disciples more remarkable for intellectual eminence than for numbers. The most prominent of these was Littré (q.v.), who afterwards edited his master's works, and established a review with the title of *La Philosophie Positive*. His discipleship, however, did not extend to the later developments of the system. Near the end of his life Comte founded the Positivist Society. Among the best-known English Positivists, Dr Congreve, Frederic Harrison, Dr Bridges, and Professor Seeley translated Comte's chief works and published many expository and illustrative papers and addresses.

Among sympathetic critics of Positivism are many thinkers of eminence imbued with the positive spirit,

and more or less indebted to the genius of Comte. Stuart Mill, in his work on *Auguste Comte and Positivism* (1865), though taking an independent standpoint, speaks in terms of high appreciation not only of the leading doctrines of the positive philosophy, but also of the conception of humanity as a *Grand être*, which is the keystone of the new religion. Many of the details of ritual and worship, however, were repugnant to him, as they have proved to many; and, while exaggerating the importance of these, he makes an arbitrary separation between the earlier and the later portions of Comte's career.

Dr Bridges replied in *The Unity of Comte's Life and Doctrines* (1866). Levy-Bruhl's *La Philosophie d'Auguste Comte* (1900) was translated with preface by Harrison (1903). Herbert Spencer took more pains to vindicate his independence of Comte than to acknowledge his obligation to him. In two essays, one on *The Genesis of Science* and the other on *The Classification of the Sciences*, he opposed Comte's views on these subjects; and he even thought it necessary to publish an article entitled *Reasons for dissenting from the Philosophy of M. Comte*. Spencer's exposition of the theory of evolution is regarded by Positivists as a valuable contribution to that scientific philosophy the inauguration of which they claim for their master. G. H. Lewes, in the chapter on Comte in his *History of Philosophy*, calls him the greatest thinker of modern times, and declares himself an ardent adherent of the positive philosophy. For the religious aspects of Positivism, however, Lewes's feeling is one of partial sympathy only. In George Eliot's works the influence of Comte's doctrines is evident, and she devoted one of her poems to the interpretation of the Positivist conception of immortality. In addition to the works of these writers, the following are the most important criticisms of Positivism, representing various degrees of sympathy and antagonism: Lord Moiley, article 'Comte' in *Encyc. Brit.*; Professor Edward Caird, *Social Philosophy and Religion of Comte*; Dr J. M'Cosh, *Christianity and Positivism*; Dr Martineau, in *Types of Ethical Theory*; Professor Huxley, 'Scientific Aspects of Positivism,' in *Lay Sermons*, and Lord Balfour, *Religion of Humanity*.

Among critics wholly antagonistic to Positivism are naturally to be found the theologians and so-called metaphysicians—i.e. all whose explanations of phenomena either assume the action of supernatural beings or are expressed in terms of abstractions such as *ideal principle*, *inherent tendency*, *nature*. Such thinkers, Positivists contend, generally profess little knowledge of scientific fact; but with these may be included many scientific specialists whose contracted view of the phenomenal world unfits them for general conceptions, and leaves them open to theological and metaphysical influences beyond the immediate sphere of their own speciality. The opposition of these classes follows from the refusal of Positivism to recognise the claims of such modes of thought to other than an historical importance.

Posse Comitatus ('the posse of the county'—the infinitive 'to be able' being used in late Latin as a noun, and meaning power or force), the whole force of the county, consisting of knights and men above the age of fifteen, with constables, who attend the orders of the sheriff to assist in enforcing process or quelling riots. Justices of the peace can also, if apprehensive of an organised resistance, command the services of the posse comitatus, and it is the sheriff's duty to raise the necessary number of men. But practically, in modern times, constables and special constables are all the assistance given or required. See SHERIFF.

Possession is the relation which subsists between a person and a thing, when the person has control over the thing, and maintains his control with the intention of exercising rights over the thing. A man may be in possession of what is not his own; a thief enters into unlawful possession of another's goods; a farmer has lawful possession of his landlord's property. Again, a man may own a thing without possessing it, and the law prescribes the forms of action, &c. whereby an owner may recover possession of his property.

In a reasonably well-governed community possession is evidence of right to possess; the person in possession is therefore protected against all the world, unless there is some other person who can show that he has a better title: this is what is meant by saying 'possession is nine points of the law.' We speak sometimes of an interest in possession, as distinguished from an interest in reversion or remainder; thus, the person who is entitled to receive the rent of land has an interest or estate in possession, though he does not possess the land. In common speech possession is frequently used as synonymous with property; but for legal purposes the two ideas must be carefully distinguished. See Hunter's *Roman Law*; and Pollock and Wright's *Essay on Possession in the Common Law* (1888). There may be joint-ownership in either personal or real property, one of the characteristics of this kind of ownership being 'benefit of survivorship'—i.e. if one of the joint-owners dies his interest accrues to the other, and does not go to the deceased co-owner's heirs and representatives. In partnership, when one partner dies his share belongs to his own personal representatives.

Possession, DEMONIAL. See DEMONOLOGY, EXORCISM.

Posset, a dietetic preparation, made by curdling milk with some acidulous liquor, such as wine, ale, or vinegar. White wine or sherry is usually preferred, but sometimes old ale is used. The milk is boiled, and whilst it is still on the fire the acidulous matter is added; if sherry, about a wine-glassful and a half to the pint of new milk is the proportion, or twice the quantity if ale. A teaspoonful of vinegar or of lemon-juice is sometimes used instead; one or two tablespoonfuls of treacle may be added, to sweeten. Taken at bedtime, it is used for colds and coughs.

Post-captain. See CAPTAIN (NAVAL).

Postglacial and Recent System. The deposits belonging to this system contain the remains of plants and animals, few of which are not still existing species. The beds consist of more or less incoherent and unconsolidated materials, which have been formed under very diverse conditions. They are represented by the low-lying alluvial flats that occupy the sites of silted-up lakes, and the bottoms of valleys at moderate elevations above the streams and rivers. Most of the bogs of northern and central Europe belong to the same system, but some had commenced to form towards the close of the glacial period. Many bogs overlie the remains of old forests, and not infrequently trees, occupying the place of growth, occur in the peat at various levels. Two such 'buried forests' have been met with in the bogs over a wide region in north-western Europe. At many places on the coasts of the British Islands and the opposite shores of the Continent peat with buried trees passes out to sea, and has been dredged up from the sea-bottom at considerable distances from the land. The only other formations that need be mentioned are the raised Beaches (q.v.) which are met with at various heights above the present sea-level, and the local moraines and fluvio-glacial gravels of the higher valleys of the Scottish Highlands. Some of these moraines come down to the level of the 45 to 50 feet bench.

The flora and fauna of the period are essentially the same as at present. In the earlier stages of the period, however, the flora of north Germany, Denmark, southern Sweden, &c. was arctic-alpine, and that flora was accompanied by the northern mammals, including the reindeer, &c. Later in the period, as the climate became more genial, the northern flora and fauna disappeared from the low

grounds of temperate Europe, and the present plants and animals took their place. Of the more notable mammals of the period in Britain were *Meagoceros* (Irish deer), *Bos primigenius*, and *Bos longifrons*. The oldest traces of man met with at this stage belong to the Neolithic phase.

Several geographical and climatic changes appear to have supervened in postglacial and recent times. After the Scandinavian flora and fauna had been succeeded in our area by the present assemblage of plants and animals, the climate appears to have become even more genial than it is in our day. Great forests spread far north into regions where trees do not now grow, and reached elevations on the mountains which they cannot now attain. At the same time many southern types of molluscs migrated into northern seas, some of which have since died out, or still survive in diminished numbers and dwarfed in size. To this genial stage belong the great oaks and other leaty trees in the lower buried forests of the bogs. Eventually the climate changed and became wet and cold. The British area, formerly continental, was insulated and of less extent than now—the sea overflowing the low ground of Scotland up to a height of 45 to 50 feet above its present level. Local glaciers then made their appearance in many mountain-glens, and even descended in some places to the sea. The 'carse-clays' (45–50 feet terrace) belong to this stage. The climate was not so favourable for the growth of great trees, which were now more restricted in their vertical and horizontal range. Over wide areas the forests decayed and became buried by mosses and their allies. The general occurrence throughout north-western Europe of a second well-marked 'buried forest' seems to indicate a return to more genial climatic conditions, giving rise to a second period of great forests, which gradually over-spread much of the moory and waste lands. Coincident with this second forest-epoch there appears to have been a gain of land, at least in Scotland, but there is no evidence to show that Britain again became continental. The second forest-epoch was succeeded as the first had been by somewhat cold and wet conditions, under the influence of which the forests decayed, while swamps and morasses increased. At the same time the Scottish area became depressed for some 25 feet or thereabout below its present level. The last physical change of which there is clear evidence is the final retreat of the sea, while the general aspect of the bogs (in which the rate of decay exceeds that of growth) would seem to indicate that we are living under drier conditions than obtained when the second forest-epoch came to a close. See EUROPE, STONE AGE.

Post-horn. See HORN.

Post-mortem Examination. Examination of the body after death is a duty which has frequently to be discharged by medical men in various circumstances, of which the most important are (1) cases of sudden or accidental death; (2) cases of lingering illness, in which the nature of the disease had not been determined during life; and (3) cases of suspected suicide or homicide. In ordinary cases where the examination is necessary or advisable for the purpose of throwing light upon the nature of the fatal illness, and where no judicial question is involved, the consent of the parents, relatives, or guardians must be procured. In medico-legal cases the order of the coroner (in England) is essential. In Scotland, when there is reason to suspect the possibility of other than natural causes for death, the sheriff, on the petition of the procurator-fiscal, authorises a medical man, or men, to perform a post-mortem examination. In such cases the examination should

always be performed by two medical men, one of whom, it is desirable, should be an expert. In all cases the position of the body and of the surrounding objects should be carefully noted, as they often throw light upon the cause of death. The external appearances of the body, such as the presence of rigidity and of putrefactive changes, should be observed, as affording a certain clue to the period at which death occurred. In medico-legal autopsies every organ in the body should be carefully examined, and its condition briefly but accurately noted. A careful microscopic examination should follow if there be the least doubt as to the nature of the diseased condition present. Finally, in cases of suspected poisoning portions of the organs must be subjected to chemical analysis. The study of the changes wrought in the various organs by disease has been one of the most potent factors in advancing scientific medicine.

Post-nuptial Contract. See HUSBAND AND WIFE, SETTLEMENT.

Post-obit (Lat. *post obitum*, 'after death') is a bond or security given by heirs and others entitled to reversionary interests, whereby, in consideration of a sum of money presently advanced, the debtor binds himself to pay a much larger sum after the death of some person, or of himself. Whenever, as is not unusual, the payment is uncertain, and depends on the obligor outliving somebody else, very high interest is required, or rather a very much larger sum is agreed to be repaid than what is advanced. These are generally usurious bargains; but the obligee or creditor can enforce payment of the full amount; though, if there is a gross case of inadequacy in the proportions amounting to fraud, a court of equity will interfere.

Post-office. (1) a government department whose primary concern is the collection and distribution of correspondence between individuals; in most countries the functions extend beyond the primary limits, and may cover communications by telegraph and telephone, parcel conveyance, passenger transport, money remittances, banking, insurance, and a multiplicity of minor social services; (2) the premises where such work is transacted. The word *post* is derived from *posita*, a contraction for *posita*, from the Latin *ponere*, 'to place,' signifying relays of mounts placed for the use of couriers along routes of travel.

The oldest and longest established postal system of which we have knowledge is that of China. Under the Chou dynasty (B.C. 1122-255) a system of foot and mounted couriers was established for the carrying of state edicts. Records are fragmentary, but there are numerous references to the system. Confucius (B.C. 551-479) says, 'Justice outstrips the speedy royal posts,' and there are enrious details, such as that urgency was indicated by attaching a feather. An ancient atlas gives a list of places served by the posts under the Han dynasty (B.C. 206-A.D. 28). These posts were known as *I Chan*, and were purely government services. Under the T'ing dynasty (A.D. 618-905) the stages were 95 miles apart, and numbered 1297 stations by road, 360 by river, and 86 partly by road partly by water. During the same period a money-order system was devised. Marco Polo, in the 14th century, estimates the number of stations at 10,000, at intervals of 25 miles and equipped with 200,000 horses. He describes the riders as changing horses without dismounting; they carried their despatches in a sealed coffer, and were distinguished by a small yellow flag worn at the collar. Military notices in the 11th century were inscribed on wooden plaques varnished to resist weather. The *I Chan* system of courier posts lasted till modern times. It is but a few years since the expresses, sealed into their

uniforms with wax seals, made their unhalting journeys of 800 miles to Lhasa, their faces chapped through exposure, their eyes bloodshot and sunken in their heads. About the beginning of the 15th century the need for a service available to the general public led to the formation of private companies whose operations spread from Ningpo along the main routes of the empire. This unofficial system was known as *Min-chu*. Cheques, silver ingots, letters, and parcels were carried; the sender inscribed the value on the cover, and if loss occurred through carelessness the last agency made good the loss. If an express service were required the sender marked a higher portage on the cover for payment by the recipient; or one corner of the envelope was burnt, or a protruding feather was enclosed. Generally, however, the public were content with the less speedy ordinary service; the charges were moderate, and varied according to distance. The *I Chan* and the *Min-chu* systems existed side by side for many centuries, till they were absorbed in the modern system established on European models in 1896 (see *Rapport de l'administration des Postes Chinoises pour 1921*, Shanghai, 1922).

The posts of antiquity were purely courier services for state business.—So the posts went with the letters from the king [Hezekiah] and his princes' (2 Chron. xxx. 6). In Egypt letter-writing had an important place in the curriculum. A papyrus of about 3000 B.C. bears a complaint from a commanding officer that certain of his men who had been sent across the Nile had been kept five days awaiting new regimentals. The existence in later ages of an organised messenger system is evidenced by the register of an intermediate post-office in the Nile valley about 270 B.C. Note was taken of the day and hour of the messenger's arrival, the packages brought, the addresses of each, and the names of the messengers to whom they were entrusted for delivery. At Tell el-Amarna, in Upper Egypt, a repository of state letters, dating about B.C. 1400, has been discovered in the shape of a large number of clay tablets addressed in cuneiform from kings and governors in Assyria, Palestine, and Phœnicia. Darius (B.C. 500) had an elaborate system of swift messenger-posts throughout Persia, and the Romans in turn had similar systems. The restriction of the posts to state purposes is illustrated by the fact that Pliny, though a minister and a favourite, apologised for granting post horses for the use of his wife on the most urgent business. The incident also illustrates the liability of any such system to become a convenience for unofficial travellers, a tendency which further obscures early postal history. To this day the English term postmaster is ambiguous: it may mean a government official charged with the oversight of local post-office affairs, or a trader who supplies horses on hire. In mediæval times a kind of post for correspondence emerged in France when the University of Paris set up a system of messengers. In 1296 these messengers were freed from tolls, and during the next two centuries the system developed, and was used, though without authority, by the general public. A royal system was established in 1464. Conveyance of unofficial letters was not at first contemplated, but it gradually became general though unauthorised. In 1576 definite provision was made for private letters for the first time. In 1637 the royal posts were given the monopoly of letter-carrying. In Germany messenger systems were maintained by political administrations and by monastic, scholastic, or commercial corporations. The Emperor Maximilian about 1489 established an imperial post for state use, but before long it was found necessary to extend the scope for the conveyance of travellers and for the transmission

of private correspondence. Maximilian's first postmaster-general was Johann von Taxis, and the family of Thurn and Taxis retained a connection with the postal affairs of central Europe until 1867.

In Britain developments were similar. Richard II., apprehensive of the landing of Henry of Richmond in 1484, 'followed the practice in the last war with Scotland [1482] of appointing single horsemen every 20 miles: . . . news was able to be carried 200 miles within 2 days' (*Chron. of Croyland*). The king's messengers, *menuti* or *cursores*, developed into a set system, fixed when the traffic was constant, with temporary expansions to meet emergencies. In 1512 a master of posts appears. An instruction of Queen Elizabeth lays down that the rider is to start within 15 minutes, and to proceed at the rate of 7 miles an hour in summer and 5 in winter, all times to be entered in a book. But only the queen's letters were thus provided for. All others are to pass as by-letters—i.e. as letters of no urgency. Apparently private letters were finding their way to the post-houses, and while not recognised or entered for were allowed on sufferance. Regulations made in 1603 gave postmasters the exclusive right of letting horses to travellers; king's messengers riding under authority paid 2½d. per mile for a horse, other travellers made their own terms. If the post-house could not provide horses the local authorities had to find them. This monopoly was largely a police measure for the surveillance of unknown travellers. A like reason led to repeated attempts by the crown to secure a monopoly of the carriage of private correspondence now rapidly growing in volume. A proclamation of 1591 had repeated earlier prohibitions against the conveyance of letters from abroad by any other means than through the regular posts. The prohibition was repeated in 1609, and again in 1637, when the restriction was applied also to inland letters. An additional reason for this was now operative, as two years earlier Thomas Witherings had introduced a scheme for the conveyance of the people's letters on payment of a fee 'the cleere profit wherof to goe towards the payment of the Postmrs. of ye Roades . . . for wch his Matie is now chargdged with 34000 p ann.' On six main routes—to Edinburgh, Holyhead, Plymouth, Bristol, Norwich, and Dover—there were to be express messengers bound to fixed times carrying 'portmantles' containing correspondence for places on their routes. 'Newes,' exclaims Witherings, 'will come sooner than thought.' The rates, which formed the foundation of British postal administration for two centuries, were—

Dist. ones	Single Letter.	Double Letter	Onuce
Up to 80 miles	2d.	4d.	6d.
80 to 140 miles	4d.	8d.	9d.
Over 140 miles	6d.	12d.	12d.
To Scotland.	8d.	(?)	(?)

According to a contemporary definition, 'a single letter is one written on a single sheet of paper sealed; a double is one sheet of paper which covers another sheet sealed up.' Witherings barely had time to bring his scheme to fruition when he fell from favour, and a long-drawn-out dispute ensued between rival claimants for office. In 1653 the Inland and Foreign Office was farmed for a rental of £10,000 a year; fourteen years later this figure had risen to £43,000. In 1657 the post-office was for the first time placed on a statutory basis, and was confirmed by the Restoration parliament of 1660. The monopolies for letters and for post-horses for travellers were retained; a postmaster-general was appointed; the office was to be farmed; the rates from London for single letters were: not exceeding 80 miles, 2d.; over 80 miles, 3d.; to Berwick, 3d.; beyond Berwick 40 miles, 2d.; over 40 miles, 4d. There were no cross-country posts;

except between towns on the same route all correspondence had to pass through London and became subject to a fresh charge. Thomas Dockwra in 1680 organised a private local post for London, which with its suburbs was divided into seven sorting districts. Between 400 and 500 offices received letters; collections were made hourly, and deliveries to twelve times a day according to the locality. The postage was 1d., which covered either a letter or a parcel not exceeding 16 ounces, and, further, carried insurance up to £10. Another innovation was the impression of post-marks showing the office of posting, time, and payment. This local post was held to be a breach of the postmaster-general's monopoly, and in less than five years was incorporated into the state service. In 1695 the Scots parliament set up a separate post-office, with a postmaster-general for Scotland, but the two offices were reunited in 1710. By the act of that year a proportion of the postal profits went to the exchequer, the remainder to the crown. Another act of this time made the theft of letters a capital offence, a penalty which existed till 1835: so late as 1832 a man was hanged under this law. Up to 1720 the cross-posts remained undeveloped. There were posts from Exeter to Chester and from Bath to Oxford, but all other posts radiated from London, and, except between places on the same route, all correspondence still had to pass through the capital. Ralph Allan undertook the development of the cross-posts, and for forty-five years held them in farm to the benefit of the public, the revenue, and himself. The post-horse monopoly was restricted in 1749 and abolished in 1779, by which time stage-coaches were running, although the mails still went on horseback. John Palmer of Bath saw the advantage of the new means of transport, and was appointed controller to the post-office to carry out his scheme. In 1784 the first mail coach ran from Bristol to London, taking seventeen hours, and inaugurating the most picturesque period of postal history. For sixty years the mail-coaches set the standard of swift communication. In 1797 the number of mail routes was forty-two, connecting sixty of the most important towns of the kingdom. Two years later the journey from London to Edinburgh took three nights and two days; the fare for travellers was £10. Forty years later the journey took 45½ hours. In 1836 there were in England 104 four-horsed mail-coaches; they carried four passengers inside and three or four out; their average speed was 8½ miles an hour; the Liverpool and Preston coach ran at 10½ miles an hour. Payment to the contractors was made on a mileage rate; the vehicles also went free from tolls. Side by side with the mail-coaches ran stage-coaches, which, carrying no mails, were free of any restrictions as to hours or number of passengers or weight of goods carried. Some of these travelled even faster than the mail-coaches. A coach between Edinburgh and Aberdeen, with fifteen passengers, travelled at an average speed of over 11 miles per hour. But another means of transport had now appeared in the railways, whose spreading tentacles slowly strangled the life of the highways. The first mail by railway was sent from Liverpool to Manchester in November 1830. The last of the old mail-coaches from London ceased running in January 1846. In the provinces, of course, they continued to a much later date. Even to day their successors are found in remote places, though horses have yielded place to petrol, and the old-time bogle has been replaced by a mechanical horn. Particularly in the Scottish Highlands there are wide areas where the railway has never penetrated, and where the only regular means for the conveyance of mails, passengers, and merchandise is the motor mail-car.

In 1837 Rowland Hill published his scheme for

national penny postage. His main contentions were that charges by distance were unsound, as an analysis of costs of conveyance showed that the cost per letter varied, not according to distance, but inversely according to the numbers carried. Further, that as a reduction of tax on a wanted article tends to encourage consumption of that article and so to maintain the revenue from the tax, a reduction in postage would not permanently decrease the revenue gained. His arguments were stoutly contested by the post-office, and the matter became a burning social and political question. An interesting forerunner of the modern pictorial diagram gives an analysis of the London to Edinburgh mail of 2d March 1838. The coach is shown with coachman, guard, and two outside passengers, while the roof is piled with sacks appropriately labelled: '2296 newspapers, weight 273 lb., go free'; '484 franks, 47 lb., go free'; '1555 letters, 34 lb., pay £93'; 'parcels of stamps go free.' Eventually parliamentary sanction was given, but, with that irony which often accompanies great reforms, the measure by which penny postage was achieved was little less than a bribe given by a tottering government to gain party support. The rates which were superseded were: within 8 miles, 2d.; to 15 miles, 1d.; to 20 miles, 5d.; to 30 miles, 6d.; to 50 miles, 7d.; to 80 miles, 8d.; to 120 miles, 9d.; to 170 miles, 10d.; to 230 miles, 11d.; to 300 miles, 12d.; and thereafter 1d. for each 100 miles. These were rates for a single letter; double letters were charged double, and triple letters triple (in 1812 it is recorded that the sorting-office at Edinburgh was purposely kept dark to obtain full advantage of artificial light in the examination for enclosures); letters weighing an ounce or more were charged one rate for each quarter-ounce. There were additional charges on letters in Scotland conveyed by mail-carriages with more than two wheels, and for sea-carriage to Ireland; also for local delivery. In place of this complicated system, the rates from 10th January 1840 became, irrespective of distance carried:

Not exceeding ½ oz.	1d.	If paid by sender; if
½ oz.	2d.	paid on delivery,
Every additional oz.	2d.	double rates.

At the same time disappeared the franking system, under which any packet, however bulky, went free of postage if its cover bore the signature of a member of either house of parliament. The queen also announced that she would, like her subjects, pay postage on her correspondence. The king's post had become the people's post. A feature of the new scheme was the inducement to prepay the charges. The original proposal was to have stamped sheets of paper or specially-printed covers to show that postage had been paid, but these fell into early disuse through the popularity of the new adhesive label, first suggested as an expedient to meet the case of a person bringing a letter to post and not being able to write the address on the purchased cover.

The immediate result of penny postage was an increase in the number of letters in the first year from 8½ millions (6½ million franks) to 169 millions, with a reduction in net revenue from £1,500,000 to £500,000. But correspondence continued to increase rapidly, and the gross revenue of 1839 was equalled in 1850 and the net revenue in 1863. Recent figures excluding post-cards, printed matter, and newspapers are: 1900, 2326 millions; 1910, 2947 millions; 1914, 3478 millions; 1920, 3832 millions; 1925 (excl. Irish Free State), 3500 millions. In the last-named year the figures for post-cards were 465 millions; printed papers, 1710 millions; newspapers, 165 millions. The increase in correspondence was accompanied by improvements in service, especially as

regards extensions of free delivery, and also by further reductions in rates. In 1897 the rates became: 4 oz., 1d.; for each succeeding 2 oz., ½d. The financial exigencies of the Great War forced a rise in rates, and penny postage was lost in 1918, when the minimum rate became 1½d., raised in 1920 to 2d. The current rates are: 2 oz., 1½d.; for each succeeding 2 oz., ½d. The surplus in 1924 on postal undertakings was £4,965,030; telegraph deficit, £1,270,925; telephone surplus, £1,596,917; net grand surplus, £5,291,022.

Rural Posts.—Up to 1764 it may be said that the post-office carried letters to post-towns only, and made no attempt at delivery; in London only was there a local post. In that year the postmaster-general received authority to set up in any town a penny post similar to that existing in London; letters to be delivered free. The measure, however, was only applied to a few of the largest towns, and at the opening of the 19th century there were neither village nor rural posts. Residents either sent for their own letters, or combined and hired a common messenger. In 1801 authority was obtained to arrange with inhabitants of non-post-towns for the collection and delivery of their letters, and also for the acceptance of guarantees for the working of posts otherwise uncommensurate. Usually the charge was 1d. per letter over and above the normal charge for conveyance by general post. In 1838 the practice was to take the post-town as centre, and to establish radiating penny posts to the surrounding country districts. At that date, however, there were parts of England exceeding the area of Middlesex where a postman never entered. The establishment of uniform penny postage rendered the problem acute. In 1843 it was decided that all places receiving 100 letters per week should have a receiving-office and a free delivery, but in 1850 this rule was found to be unsatisfactory, and the principle was adopted that a post should be established if it paid its way—i.e. if the cost was covered by the revenue, calculated at ½d. on each letter delivered. The delivery service might be daily or less frequently as circumstances warranted. This principle remains operative to the present day. In 1859, 93 per cent. of the whole correspondence was delivered free. Successive efforts were made to provide for the balance of undelivered letters, and in 1897, as part of the celebration of the diamond jubilee of Queen Victoria, it was announced that a regular delivery would be given to every house in the kingdom. The extension of deliveries in rural areas during recent years has been facilitated by the employment of mechanical aids to locomotion—bicycles, motor-cycles, and motor-vans—which enable a postman to travel greater distances and to carry heavier loads than would otherwise be possible.

Travelling Post office. An important factor in speeding inland communication is the travelling post-office system widely developed on our railways, particularly as regards night mails. One or more coaches on a train are fitted with suitable apparatus and fittings, and throughout the journey sorters are continually receiving, sorting, and despatching mails. Even when the train is travelling at full speed a net attached to the carriage sweeps in bags hung from wayside standards, and bags suspended outside the carriage are similarly caught by nets on the ground by the rails. The system arose out of experiments made in 1838. Its most complete development is seen in the down-specially night mail train leaving Euston at 8.30 p.m. The train is composed entirely of vehicles reserved for post-office purposes, its ultimate destination being Aberdeen. Another example of post-office enterprise in transport is the construction of an underground electric railway between the London

office and the chief railway termini for the avoidance of street conveyance of the mails.

Subsidiary Postal Concerns.—Besides the conveyance of letters, the post-office provides for the conveyance of other classes of matter—*Newspapers*. In the 17th century postmasters received gazettes free. Later the stamp-duty imposed on news papers was held to cover postage. In 1855 this duty was repealed. When stamped, newspapers continued to go free; if unstamped, they went at book rates. In 1870 a news rate at 3d. a copy was introduced. Current rate, 2 oz., 3d.; 6 oz., 1d.; each 6 oz. thereafter, 3d.; numbers (1925), 165 millions. *Book post* (1848). Original rate, 6d. per lb.; altered 1904 to 3d. packet post; now includes books, printed papers, and commercial documents falling within certain restrictions; numbers (1925), 1710 millions. *Sample post* (1863). For bona fide traders' samples; rates now as for letters and parcels. *Post-cards* (1870). Originally only officially printed cards impressed 3d.; private post-cards were allowed in 1891; numbers (1925), 465 millions. *Blind post* (1906). For encouragement of literature for blind. *Railway letters* (1891). Letters can be handed in at most railway stations for conveyance by next train for delivery at destination by ordinary post. *Express delivery* (1891). (a) By special messenger all the way; besides applying to letters and parcels, this service includes the conducting of persons and animals; (b) in advance of usual delivery on request of sender; (c) in advance of usual delivery on request of addressee; (d) on Sundays; (e) after transmission by telephone. *Registration* (1841). Limited compensation was added in 1878; in 1886 insurance of letters and parcels was allowed up to £10; current limit, £400. *Air post*. Conveyance by air is useful mainly on long routes and where there is no standardised railway communication. The method suffers from irregularities and interruptions at present inseparable from air transport, and is not yet suited to the needs of commercial correspondence, which requires regularity and punctuality not less than speedy transit. *Parcel post* (1883). Initial rates were 1 lb., 3d.; 3 lb., 6d.; 5 lb., 9d.; 7 lb., 12d. First year's traffic was 23 millions; in 1910, 120 millions; 1914, 137 millions; 1920, 143 millions; 1924 (excluding Irish Free State), 126 millions. *Cash on delivery* (1926). Payment for the goods sent by parcel post is collected on delivery, and is remitted to the sender.

Besides conveyance services the post-office undertakes certain financial business, including transmission of money, banking, and insurance. *Money-orders* (1838). In 1792 an unofficial cheque-bank scheme was undertaken by certain officers of the post-office. The business thus developed was taken over in 1838. In 1889-90 telegraph money-orders were introduced. Any sum can be so sent up to £40. In 1924 10½ million inland money orders were issued, value £73,000,000, and 3¼ million foreign orders, value £11,500,000. *Postal orders* (1881) are issued in fixed denominations from 6d. to 21; they form a cheap and convenient method for transmitting small sums; in 1924 109½ million postal orders were issued, value £38,000,000. *Savings-bank* (1861). While the accounting work is centralised in London, deposits and withdrawal may be effected at all offices of any importance. Interest is paid at the rate of 2½ per cent.; there is now no limit to the total sum which may be deposited; purchase and sale of government securities is also undertaken; number of active depositors, 11½ million. *Annuities and insurance* (1864). The amount of business is not large. *Licences of many kinds*—dogs, guns, motors, wire less, &c.—are issued at post-offices. *Pension payments* are made in connection with state schemes.

Telegraphs, Telephones, and Wireless Telegraphy. The post-office also controls communication by electrical means. *Telegraphs* (1870). An act of 1868 authorised the postmaster-general to acquire the inland telegraph systems of the United Kingdom, and invested him with a monopoly of telegraphic communication. The transfer took place in 1870; rates were 20 words 1s., addressees free; in 1885 rates were reduced to 12 words 6d., additional words 3d., addressees charged. The inclusion of the telegraph system created a large department for engineering work in connection with erection and maintenance of wires and cables. The initial expenditure was charged to a capital account of £10,948,000; at no time has the revenue been sufficient to meet the interest on this amount. Mileage of telegraph-wires (1924), 265,000. *Telephones*. A legal decision in 1880 decided that the postmaster-general's monopoly in telegraphs covered telephonic conversations, and the various telephone companies thereafter worked under licence. They amalgamated in 1889 as the National Telephone Company. In 1896 the post office purchased the trunk or long-distance lines; at the end of 1911 the whole system passed to the post-office. Exchanges (1924), 3500; subscribers, 720,000; calls, 1000 millions. *Wireless telegraphy and telephony*. An act of 1904 (amplified 1925) makes it illegal to install or work wireless apparatus except by permission of the postmaster-general. The post-office maintains coastal radio stations at Wick, Callercotes, Grimsby, North Foreland, Niton (Isle of Wight), Land's End, Seaford (Liverpool), Portpatrick, and Malinhead. There is also a station at Valentia. These stations have an effective range of about 250 miles. Devices station has a range of 1500 miles, Oxford 3000 miles, and Rugby, the most powerful station in operation, is practically world-wide in range. A recent and popular development is broadcasting, the transmission by wireless telephony of daily programmes of music, plays, news, educational talks, speeches, &c. This is undertaken by the British Broadcasting Company working under licence from the postmaster-general; in 1926 twenty stations were in operation. *Regulations and Charges*. For current information see the *Post office Guide*, published half-yearly, which may be consulted or purchased at any post-office.

Organisation and Staff—The highest authority in the post-office is the postmaster-general, with whom is generally associated an assistant postmaster-general. These are political heads responsible to parliament and demitting office on a change of government. The chief of the permanent staff is the secretary, assisted by various assistant secretaries and technical officers, and by a secretary for Scotland at Edinburgh. The secretary's office deals with matters of administration and questions of policy. Controllers are responsible for separate departments dealing with London postal service, central telegraph-office, London telephone service, money-orders, savings-banks, and stores. The accountant-general is responsible for the vast accounting work, and acts as financial adviser. The engineer-in-chief supervises the erection and maintenance of telegraph and telephone wires, cables, telephone exchanges, radio stations, and apparatus. In the provinces the district surveyors (12) and postmaster surveyors (9) possess wide powers in their respective districts. Postmasters (498) in towns deal with local details. The total permanent staff in 1926 numbered 227,891 (full-time, 142,566 men, 37,967 women; part-time, 32,548 men, 14,810 women). Of these, 36,381 were sorting-clerks and telegraphists, 18,589 telephonists, 72,168 postmen and deliverers, and 20,071 sub-postmasters. The health of the staff

is looked after by 2300 medical officers paid on a capitation basis. The staff, through local Whitley committees, has a voice in local arrangements, and through the national Whitley council in certain aspects of administration.

Legal.—So far as postal matters are concerned, the various post-office acts prior to 1908 are consolidated in the act of that year (8 Edw. VII. chap. 48), and this act now forms the basis of post-office administration. It deals with the right to fix rates and charges, various classification of correspondence, money-orders and postal orders, ship letters, appointment of postmaster general and subordinate officers, post-office accounts and expenses, holding and purchase of lands, extension of accommodation and facilities, offences against the post office, legal procedure, exemption from tolls and ferrage, &c.

International Postal Union.—A conference on international postal affairs was held at Paris in 1863, and led the way to the treaty of Berne in 1874, when delegates from twenty-two countries first consolidated the Postal Union for the regulation of international postal questions. The union now embraces practically all civilised nations, and its periodic conferences fix maximum rates and legislate on all the complex questions of inter-state traffic. Its offices in Berne form a headquarters for statistical and other information.

Post-Tertiary. See QUATERNARY.

Posy. See RING.

Potamogeton, a considerable genus of aquatic plants (pond-weeds), very difficult of discrimination, spread over the greater part of the globe, and living chiefly in fresh water. Some botanists make it the type of the family of Potamogetonaceae, others include it in Najadaceae. See AQUATIC PLANTS; and Fryer and Bennett, *The Potamogetons of the British Isles* (1898-1915).

Potash. See POTASSIUM; also AERATED WATERS.

Potassium (sym. K; atom. no. 19; atom. weight 39.15) is one of the alkaline metals. The letter K is selected as its symbol, as the first letter of *Kali*, the Arabic word for potash, P being already taken as the symbol for phosphorus. The following are the chief characters of this metal. It is of a bluish-white colour, and presents a strong metallic lustre. It melts at 146.5° (62.5° C.), and at a red heat is converted into vapour. Its affinity for oxygen is so great that on exposure to moist air it immediately becomes covered with a film of oxide, and hence it must be kept below the surface of naphtha. When heated it burns with a violet flame. Its intense affinity for oxygen is well shown by throwing it into water, on which, from its low specific gravity, .865, it floats. The metal abstracts oxygen from the water, and forms oxide of potassium (potash); while the liberated hydrogen carries off a small portion of the volatilised potas-

sium, and, taking fire from the heat evolved by the energetic chemical action, burns with a brilliant violet flame. The experiment is a very beautiful one, the burning metal swimming about rapidly on the water, and finally disappearing with an explosion of steam, when the globe of melted potash becomes sufficiently cool to come in contact with the water.

Potassium does not occur in the native state, and can only be obtained by the reduction of its oxide, potash. In 1807 Davy prepared it by decomposing its hydrated oxide (potash) by means of a voltaic current, and this process is now the one usually employed on the large scale. It may be manufactured by distilling a mixture of carbonate of potash and charcoal in an iron retort.

If proper proportions are taken, the mixture is wholly converted into carbonic oxide and potassium, as is shown in the equation:

Potassium forms two compounds with oxygen, viz. a protoxide, K₂O, which constitutes potash, and is strongly basic, and a peroxide, K₂O₂. Of these the former is the only important one.

Potash can be prepared in the anhydrous form by heating thin slices of the metal in an perfectly free from moisture or carbonic acid. It is white, very deliquescent, and caustic. When moistened with water it becomes incandescent, and the water cannot be expelled by any degree of heat. A far more important substance is the *Potassic Hydroxide* or *Caustic Potash* (KOH). This is commonly prepared by dissolving carbonate of potash in ten times its weight of water, and gradually adding to the boiling solution a quantity of slaked lime equal in weight to half the carbonate of potash used. The resulting compounds are carbonate of lime, which falls as a precipitate, and hydrate of potash, which remains in solution; the changes being expressed by the equation:

The clear supernatant fluid is removed by decantation, or by means of a siphon, into a clean silver or iron basin, and is rapidly evaporated till it flows tranquilly like oil. It is then either cast into cylinders in metallic moulds, or poured upon a cold slab, and solidifies on cooling. As so obtained it is very impure, but by solution in alcohol and evaporation a very pure article is produced.

The hydroxide, on solidifying after fusion, occurs as a hard, grayish white, opaque body, with a crystalline fracture, which may be readily again fused into a colourless oily fluid, but which only volatilises at a very high temperature. It is soluble in about half its weight either of water or of alcohol, and rapidly absorbs both carbonic acid and moisture from the atmosphere. It acts as a powerful caustic, and quickly destroys both animal and vegetable tissues, and hence its solutions can only be filtered through asbestos or pounded glass or sand. Its affinities are so powerful that few vessels are capable of resisting its influence. Its solution must be preserved in glass bottles into the composition of which no oxide of lead enters, as it has the property of dissolving this oxide out of the glass. Vessels containing silica (porcelain, earthenware, &c.) are decomposed, and platinum itself is oxidised when heated in contact with it.

The *salts* which potassium forms with acids are for the most part readily soluble in water, and colourless, unless (as, for example, in potassium permanganate) the acid is coloured. Most of them

are crystallisable, and they all communicate a violet tint, characteristic of potassium, to the blow-pipe flame. Many of them occur in animals and vegetables, and the ashes of plants contain them in large quantity.

Potassium Carbonate, K_2CO_3 , can be got by burning plants in dry pits, dissolving the ashes in water, evaporating till the sulphates, chlorides, &c. separate in crystals, and then boiling the mother liquid to dryness in iron pots. The quantity of pure carbonate of potash contained in it is liable to great variation, and for pharmaceutical purposes it must be dissolved in water and crystallised, the crystals containing about 20 per cent. of water. It is made now by a modification of the Le Blanc process (see SODIUM). It is extremely deliquescent, and is soluble in less than its own weight of water, but is insoluble in alcohol. It has an acid, alkaline taste, and its reaction upon test-paper is strongly alkaline. It is a compound of great importance, both as a chemical reagent and as entering largely into the preparation of most of the other compounds of potassium, and into the manufacture of soap and glass. The commercial carbonate is often called *Pearl Ashes*. **Bicarbonate of Potash**, $KHCO_3$, is obtained in white rhombic prisms, by passing a current of carbonic acid gas through a strong solution of carbonate of potash. These crystals are permanent in the air, but are decomposed by heat; water and carbonic acid being evolved, and the simple carbonate left. This salt is much less soluble than the carbonate, requiring four parts of cold water for its solution, which is nearly neutral to test-paper, and has a much milder taste than the preceding salt. It is employed as an antacid in medicine. The **Sulphate**, K_2SO_4 , and **Bisulphate**, $KHSO_4$, may be prepared by treating potash with sulphuric acid. **Nitrate of Potash** has been already described under the head NITRE. **Chlorate of Potash**, $KClO_3$, occurs in white rhomboidal tablets of a pearly lustre. It has a cooling taste like that of nitre. It fuses at a gentle heat without decomposition but on increasing the heat it gradually gives off all its oxygen, and is converted into chloride of potassium, according to the equation:

It is not very soluble, as it requires for solution 16 parts of cold and 1·7 parts of boiling water. It even surpasses nitrate of potash as an oxidising agent; and if combustible substances, such as carbon, sulphur, or phosphorus, be heated or forcibly rubbed with it, a detonation or explosion occurs. This salt is employed in the manufacture of *Match*es (q.v.), in certain operations in calico printing, and for filling the friction-tubes employed for firing cannon: the best mixture for these tubes consisting of 2 parts of this salt, 2 of sulphide of antimony, and 1 of powdered glass. A mixture known as *White Gunpowder*, consisting of chlorate of potash, dried ferrocyanide of potassium, and sugar, has been employed for blasting purposes, but its preparation is accompanied by so much danger that it is seldom used. This salt does not occur as a natural product, but may be obtained along with chloride of potassium by passing a current of chlorine gas through a hot solution of caustic potash. The two salts are easily separated by crystallisation, as the chlorate is comparatively insoluble, and the chloride extremely soluble. **Hypochlorite of Potash** can only be obtained in solution. Under the title of *Eau de Javelle*, it is sold as a bleaching agent. It is obtained by passing chlorine gas through a cold dilute solution of carbonate of potash, when chloride of potassium and hypochlorite of potash are formed, from which

the chloride may be removed by crystallisation. The **Phosphates of Potash**, formed by the different varieties of phosphoric acid, are sufficiently noticed in the articles PHOSPHORUS and MANURE. The **Silicates of Potash** are important compounds in connection with the manufacture of glass; they also enter into the composition of Fuchs's *Soluble Glass* (see GLASS), or *Water-glass*, and have been employed as a coating by which the decay of magnesian and other limestones may be prevented. The **Chromate and Bichromate of Potash** are noticed in the articles CHROMIUM and CALICO-PRINTING. The haloid salts of potassium may be passed over very briefly. The **Chloride of Potassium**, KCl , is obtained in large quantity in the preparation of chloride of potash, or may be procured by burning potassium in chlorine gas, when the result of the brilliant combustion which takes place is this salt. In its general characters it closely resembles common salt, $NaCl$, except that the former communicates a violet and the latter a yellow tint to the flame of alcohol. It is a constituent of sea-water, of salt marshes, and of many animal and vegetable fluids and tissues. The **Bromide and Iodide of Potassium** are noticed in the articles BROMINE and IODINE. **Fluoride of Potassium**, KF , possesses the property of corroding glass. There are several sulphides, the most important being the *Liver of Sulphur*, prepared by fusing together carbonate of potash and sulphur. Besides its use in skin diseases, it is much employed by florists to prevent mildew on roses. The **Yellow and the Red Prussiate** (or the **Ferrocyanide and Ferricyanide of Potash** are noticed at FERRICYANOGEN and FERROCYANOGEN. The **Cyanide of Potassium**, KCN , may be procured by heating potassium in cyanogen gas, when brilliant combustion occurs, and the resulting product is this salt. It may, however, be more cheaply and easily prepared by fusing together 8 parts of ferrocyanide and 3 of carbonate of potassium. This salt forms colourless deliquescent crystals very soluble in water. It exhales an odour of hydrocyanic acid, and is nearly as poisonous as that acid. Its great deoxidising power at a high temperature renders it a valuable agent in many of the finer operations of metallurgy.

The following are the ordinary tests for the potassium compounds. (1) Solution of tartaric acid added in excess to a moderately strong solution of a potassium salt gives after some time a white crystalline precipitate of cream of tartar (see TARTARIC ACID). The result is hastened by stirring or shaking. (2) Solution of bichloride of platinum gives a crystalline yellow precipitate, which is a double salt of bichloride of platinum and chloride of potassium. If not previously acid, the mixture to be tested should be acidulated with hydrochloric acid. (3) The violet tint occurring in the presence of potassium in the outer flame of the blow-pipe, or in the flame of spirit, has been already noticed. (4) The spectrum of a flame containing potassium exhibits a characteristic bright line at the extreme limit of the red, and another one at the opposite violet limit of the Spectrum (q.v.).

In medicine the following compounds are used. **Caustic Potash**, or **Hydroxide of Potash**, KOH , is supplied in hard white pencils. From its power of dissolving the animal tissues, it is sometimes used as a caustic, although its great deliquescence renders it somewhat difficult to localise its action to the desired spot. In bites of venomous serpents, mad dogs, &c. it may be applied with advantage, and it is useful in destroying warts and fungoid growths of various kinds. **Solution of Potash**, commonly known as *Liquor potassæ*, is obtained by the process already given for the preparation of hydrate of potash. *Liquor potassæ*, in combination with a

tonic infusion, is of service in cases of dyspepsia which are accompanied with excessive acidity of the stomach, such, for example, as often occur in habitual spirit-drinkers. It is also frequently given with the view of rendering the urine alkaline, or of diminishing its acidity in cases in which that secretion is too acid. The usual dose is ten drops, gradually increased to as much as a fluid drachm. *Acetate of Potash*, $\text{KC}_2\text{H}_3\text{O}_2$, is obtained by the action of acetic acid on carbonate of potash, and occurs in white foliaceous satiny masses. In its passage through the system it is converted into carbonate, and thus renders the urine alkaline. In small doses, as from a scruple to a drachm, it acts as a diuretic, and is of service in some forms of dropsy. Combined with other potass. salts, it is much given in acute rheumatism. The two carbonates and the sulphurated potash have been already referred to. The iodide is also largely used as an alterative.

The *Chlorate of Potash* has come much into use as a popular remedy for sore throats. For this purpose it is usually employed in the form of compressed pellets, which are allowed to dissolve slowly in the mouth.

Potato (*Solanum tuberosum*; see SOLANUM), one of the most important of cultivated plants, and in universal cultivation in the temperate parts of the globe. It is a perennial, having herbaceous stems, 1 to 3 feet high, without thorns or prickles; pinnate leaves with two or more pair of leaflets and an odd one, the leaflets entire at the margin; flowers about an inch or an inch and a half in breadth, the wheel-shaped corolla being white or purple, and more or less veined, followed by globular, purplish fruit, of the size of large gooseberries; the roots producing tubers. The herbage has a slightly narcotic smell, although cattle do not refuse to eat a little of it, and the tender tops are used in some countries like spinach. The tubers are, however, the only valuable part of the plant.

It was long customary to speak of the potato as a native of mountainous districts of tropical and subtropical America; but it has never been clearly determined where it is really indigenous, and where it has spread after being introduced by man. Humboldt doubted if it had ever been found truly wild; but subsequent travellers, of high scientific reputation, express themselves thoroughly satisfied on this point. It has been rendered certain that long before the Spaniards reached the New World the potato was cultivated by the Incas and other Andean nations. It seems to have been first brought to Europe by the Spaniards, from the neighbourhood of Quito, in the beginning of the 16th century, and to have spread from Spain into the Netherlands, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity, and not for general use as an article of food. It is said to have been brought to England from Virginia by Sir John Hawkins in 1563; and, again, in 1586 by Sir Francis Drake, to whom indeed a statue, as the introducer of the potato, was erected at Offenburg, in Baden, in 1853. Anyhow, it cannot have attracted much notice; and though Raleigh is believed to have planted potatoes both at his Devonshire birthplace Hayes, and on his Munster estates, it was a long time before they began to be extensively cultivated. It long received throughout almost all European countries the same name with the Batatas or Sweet Potato (q.v.), which is the plant or tuber meant by English writers down to the middle of the 17th century in their use of the name potato. Gerard, in his *Herball*, published in 1597, gives a figure of our potato under the name of *Batata Virginiana*; but so little were its merits appreciated that it is not even mentioned in the *Complete Gardener* of

Loudon and Wise, published more than a century later, in 1719; whilst another writer of the same time says it is inferior to skirret and radish! It began, however, to be imagined that it might be used with advantage for feeding 'swine or other cattle,' and by-and-by that it might be useful for poor people, and for the prevention of famine on failures of the grain-crops. The Royal Society took up this idea, and in 1663 adopted measures for extending the cultivation of the potato, in order to the prevention of famines. To this the example of Ireland in some measure led, the potato having already come into cultivation there to an extent far greater than in any other European country, and with evident advantage to the people. From Ireland the cultivation of the potato was introduced into Lancashire about the end of the 17th century, soon became general there, and thence spread over England; so that before the middle of the 18th century it had become important as a field-crop, which it became in the south of Scotland some twenty or thirty years later, about the same time in Saxony and some other parts of Germany, but not until the later part of the century in some other parts of Germany and in France. In France the potato was long supposed to cause leprosy and fevers, and the extension of its culture was mainly due to the exertions of Parmentier (1778). In Prussia Frederick the Great took an interest in it, and promoted it by compulsory regulations.

The potato is of great importance as affording food both for human beings and for cattle; and next to the principal cereals is the most valuable of all plants for human food. It is also used for various purposes in the arts. No food-plant is more widely diffused; it is cultivated in sub-tropical countries, and struggles for existence in gardens even within the Arctic Circle, yielding small and watery tubers, although the effects of late spring frosts, or early autumnal frosts, upon its foliage often prove that it is a plant properly belonging to a climate milder than that of most parts of Britain. No more important event of its kind has ever taken place than the general introduction of potato culture into the husbandry of Britain and other European countries. It has exercised a beneficial influence on the general welfare of the people, and has increased the national wealth, notwithstanding the occasional occurrence of famine and distress (notably in the years 1846 and 1847) in Ireland and elsewhere from the failure of the crop. The results—due mainly to excessive and imprudent cultivation of the potato—confirmed two great laws, that plants long very extensively or almost exclusively cultivated in any district, however successfully they may be cultivated for a time, are sure to fail at last; and that the exclusive, or almost exclusive, dependence of a people on one source or means of support is unfavorable to their welfare in respect to all their interests.

The potato has the specially valuable capability of producing an exceptionally large quantity of food from a given area. Thus the average yield (by weight) is probably eight or ten times as great as that of wheat, and, since wheat is less than four times as nutritious as potatoes, the latter crop produces more than twice as much nutriment per acre as the former. The tubers have, however, the disadvantage that they are a less complete food than wheat, being notably deficient in protein. Consequently they require to be used in conjunction with foods rich in protein, such as meat, fish, or cheese. Where potatoes bulk too largely in the diet, both physical and mental energies deteriorate, a fact which has been noted from time to time in Ireland and in the Scottish Highlands. The potato tuber in its natural state contains about

75 per cent of water, 20 per cent of carbohydrates, principally starch, about 2 per cent of albuminoids, and small quantities of fibre, other organic substances, and ash. There are considerable differences, however, in different varieties, different stages of ripeness, and in samples grown under different soil and climatic conditions.

Potatoes are used, both raw and boiled, for the feeding of cattle. For human food they are variously prepared by roasting or boiling, but now chiefly by boiling, a process by which they are freed from all that is narcotic and noxious in their juice. The water in which potatoes have been boiled is not wholesome.

Experimental attempts have been made to use the herbage or haulm of the potato for paper-making, but the results were unsatisfactory. A kind of vegetable ivory has been made from the pulp, and it is said that passable cigarettes can be made from the leaves. The plant, of course, belongs to the same family as tobacco.

The varieties of the potato in cultivation are extremely numerous—500 were exhibited at the Westminster Tercentenary Exhibition (1886). Any enumeration or classification of them is impossible. New ones are continually appearing, and old ones passing away. Those most advantageously cultivated in particular soils and climates are often found to degenerate when removed to a small distance. Potatoes differ considerably in the character of their herbage—which is sometimes erect, sometimes straggling—and in the size and colour of their flowers, but are more generally distinguished by the size, form, and colour of their tubers, which are round, long, or kidney-shaped, white, red, dark purple, variegated, &c.

New varieties of potato are produced from seed; but potatoes are ordinarily propagated by planting the tubers, or cuttings of the tubers, each containing an eye or bud. Much has been written by gardeners and agriculturists on the comparative advantages of planting whole tubers or cuttings; but the former method generally prevails.

Potatoes are planted in drills, made either by the spade or plough, or in *lazy beds*, which are always made by the spade, and are beds in which the sets of potatoes are covered over with earth dug out of the alleys. The alleys serve, although imperfectly, for drains in undrained land. The cultivation of potatoes as a field-crop seems to have been first attempted in lazy beds. They are still common in many parts of Ireland, but are now scarcely ever seen in England or Scotland. They are very suitable for strong, heavy, and somewhat moist land, and are profitably used in reducing some kinds of soil to cultivation, but are generally unsuitable for field-culture, owing to the expense of labour required. In strong, heavy land potatoes are cultivated in raised drills: in lighter and drier soils the raising of the drills is unnecessary. Manure is invariably given, consisting generally of farmyard dung and artificial manures. Common dressings consist of from fifteen to twenty five tons of dung per acre, with from five to ten cwt. of artificial manure, such as a mixture of two parts superphosphate, one part sulphate (or chloride) of potash and one part sulphate of ammonia. The cultivation of potatoes, after they are planted, whether in the field or garden, consists chiefly in keeping the ground clear of weeds, and in earthing up the plants, to promote the formation of tubers. Potatoes are taken up by the fork, by turning over the drills with the plough, or by an implement specially designed for the purpose, known as a potato-raiser. Where the crop is grown extensively this implement is now almost universally used, and performs its work expeditiously and thoroughly. Garden potatoes are generally used

long before they are really ripe, forming a favourite dish in a very unripe state, when they are far from being a safe article of food, and contribute not a little to the prevalence of cholera and kindred diseases in summer. In recent years the growing of early potatoes for use in the large towns has been prosecuted to a large extent and with much success on the coast of Ayrshire and other similar parts favoured with a genial climate. To facilitate this the seed is forced in small boxes in which it is placed over winter, and from which it is taken in spring when the shoots are 2 to 4 inches long and planted in well-manured drills. Potatoes from seed thus prepared may be dug about three weeks earlier than if the seed had not been sprouted. The main field-crop is allowed to ripen thoroughly, and is capable of being stored for winter and spring use. The planting of potatoes in the open air cannot be successfully practised in most parts of Britain before February or March. April and the early part of May are more normal times. The storing of potatoes is variously accomplished in dry lofts or sheds, in airy cellars or barns, and in *pits*, which are sometimes holes excavated to a small depth in the earth, with the potatoes piled up above the surface of the ground, in a conical, or in a roof-like form, sometimes mere heaps of one or other of these forms upon the surface of the ground, and covered with straw and earth to keep out light and frost. Potato-pits should always be well ventilated by means of pipes or otherwise, as without ventilation the potatoes are apt to heat and sprout. Potatoes taken from the ground before they are quite ripe are extremely apt to heat and sprout.

The potato crop is now an important one in most parts of Britain, the largest proportion of land being occupied by it in the Lincolnshire and Cambridgeshire Fens, in Lancashire, in the Vale of York, and in the eastern counties of Scotland. It very commonly succeeds a grain crop, but sometimes is advantageously planted on land newly broken up from grass.

Besides its value as a culinary vegetable, the potato is important in other respects. Its starch is very easily separated, and is in large proportions; hence it is cheaper than any other kind. It is manufactured on a very large scale. It is chiefly used in textile manufactories under the name of *farina*, which is converted into dextrine or British gum (see STARCH). In Holland and in Russia, where there is much difficulty in keeping potatoes through the winter, and there is consequently a necessity for using the crop quickly, large quantities of starch are made, and this is converted into sugar or syrup (see SUGAR). The refuse of the starch-manufactories is all utilised; it is pressed out from the water, and used either for pig feeding or for manure. In the north of Europe much spirit for drinking is made from potatoes; it is called *Potato-brandy*.

The potato is subject to several diseases, the chief of which is that serious fungous affection now commonly known as the *potato disease*. This disease was first observed in Germany; the earliest known outbreak of a grave character occurred at Liège in 1842. It broke out in Canada in 1844, and at once proved very destructive. In the following year it made its appearance in the British Isles, having been first observed in the Isle of Wight. Its ravages in Ireland in 1846 and 1847 brought a terrible famine upon the small farmers of that country, and at frequent intervals since it has caused great loss in the potato crop.

It has been proved beyond doubt that a particular fungus causes this peculiar and destructive disease. This mysterious fungus, *Phytophthora infestans*, runs through a strange life-cycle every year, and is by no means easily kept at bay. It is believed that, except in temperatures below 40° and above

77° F., it is always present, ready to pounce upon a weak potato-plant, and liable to develop into an epidemic should the climatic conditions be favourable to fungus-life. These conditions are damp, dull, calm weather, and a moist or wet soil, enveloped in mists morning and evening. The fact that the fungus is unable to bear a temperature above 77° or below 40° is of practical importance. The tomato is also subject to the attacks of the *Phytophthora*, but the ravages of the fungus may be stopped by raising the temperature of the tomato-house to over 77° F. On the potato crop the fungus generally makes its appearance about the third week in July, almost invariably beginning its attack in the leaves of the potato-plant. There it is first seen in a delicate white bloom, accompanied by dark blotches, caused by the spawn of the fungus having pierced the leaf and set up putrefaction. With favourable climatic conditions it will now develop with great rapidity—a single germ multiplying ten thousand times in a few days in a temperature from 60° to 68° F.

Potato Disease (*Phytophthora infestans*).

A. Hyphae of fungus on under surface of potato leaf, bearing conidia. B. Conidium or spore. C. Conidium germinating, producing hyphae directly. D. Conidium breaking up into zoospores. E. Zoospores bearing cilia, by which they are able to swim in drops of moisture. F. Zoospore in resting condition. G. Zoospore germinating.

The fungus ramifies throughout the leaves, blasting them as it proceeds, and causing an offensive odour which is now unfortunately familiar to the farmer. The spores of the fungus are of two kinds, *conidia*, which are scattered by the wind, and *zoospores* which are motile, and swim in rain drops or dew. They are carried about and spread from one patch of potatoes to another by insects and birds. From the leaves the germs spread to the leaf-stalks, the stems, and the tubers. The spawn readily pierces the skin of the tuber, consuming or rotting the cells, and corroding the starch, and ultimately reducing the potato to a black mass of rotteness. In this last stage of its yearly course of destruction the fungus provides means of continuing its curious life. It produces some kind of 'resting-spores', which, possessed of amazing vitality, lie dormant during winter and spring, and carry on the disease to the crop of the succeeding year, which in its turn passes the fungus through another round of its mysterious life, to be handed on again from crop to crop as before. There is still uncertainty as to the precise character of these spores; but, be what they may, their tenacity of life is great.

Of the many remedial measures that have been tried, the following have been found most useful in preventing or mitigating the onslaught of the fungus: (1) Earthing up the drills with a deep covering of earth, with the view of preventing the spores of the fungus from passing down through the soil to the tubers; (2) cutting off the diseased potato-tops before the fungus reaches the tubers; (3) removing and burning all dead and decaying potato stems, leaves, and tubers, especially after a crop which has been attacked by the disease;

(4) planting varieties which have been known to be exceptionally successful in resisting the disease; (5) growing the potato crop under such general cultural, sanitary, and manurial conditions as will ensure to the fullest extent possible the healthy and vigorous development of the crop; (6) careful selecting and storing of potatoes to be used as seed; and (7) dressing the potato tops, both before and after the appearance of the disease, with Bordeaux Mixture. No certain prevention or absolute remedy has as yet been discovered, but the last-mentioned measure has been carried out with very great advantage. This is the mixture—12 lb. copper sulphate, 8 lb. fresh quicklime to 100 galls. water—which proved so effective in combating the allied parasite fungus, *Peronospora infestans*, that attacks the vines, and it has been demonstrated that it can be used almost equally successfully in averting the potato disease. It is well known that a vigorous variety of potatoes grown under conditions favourable to its healthy development is most successful in resisting the fungus. It is with the potato as with a human being—deprive it of wholesome food and healthy sanitary surroundings, and disease will speedily ensue. The prevalence of this particular disease in recent years is a sure indication of a deterioration in the constitutional vigour of the cultivated potato. The other diseases from which the potato crop is liable to suffer are *Curly*, *Scab*, *Dry Rot*, *Wet Rot*, and *Black Scab*. *Curly* is a disease affecting the foliage and general health of the potato-plant, and is caused by an ultra-microscopic organism or virus which is small enough to pass through a porous porcelain filter.—*Scab* is a disease of the tubers, which become covered with brown, oblong, and finally confluent and cup-shaped spots, whilst under the surface is a powdering of minute olive-yellow grains, a fungus called *Spongospora subterranea*.—*Dry Rot* is also ascribed to the growth of a fungus, *Fusarium solani*, and attacks the tubers either when stored for winter or after being planted. It was first observed in Germany in 1830, and caused great loss in that country throughout many years. The tissues of the potato-tuber become hardened and completely filled with the mycelium of the fungus, which at last bursts forth in little cushion-shaped tufts loaded with fructification. *Wet Rot* differs from dry rot in the tubers becoming soft and rotten instead of hard and dry, and is due to two species of bacteria, apparently assisted in most cases by various kinds of fungi. *Wart disease* or *Black Scab*, due to the fungus *Chrysophyctes endobiotica* was first noted in Britain in 1899, having in all probability been introduced from the continent of Europe. It is now very prevalent in certain areas. The main preventive measure is to grow immune varieties, of which there are many. The Potato frog fly (*Euteryx solani*, Curtis) and the caterpillar of the Death's-head Moth (*Acherontia atropus*, Linn.) feed on the leaves and stems of potatoes, but rarely do serious damage. See books on potato culture by Sanders (1905), Findlay (1906), and Grubb and Guilford (1912).

Potato. SWEET. See SWEET POTATO.

Potato-beetle. See COLORADO BEETLE.

Potchefstroom, a town in the south of the Transvaal, 105 miles SW. of Pretoria, has a university college. Pop. 14,000 (10,000 whites).

Potemkin, GREGORY ALEXANDROVITCH, the most celebrated of the Empress Catharine II.'s favourites, was born near Smolensk on 16th September 1739, the descendant of a noble but impoverished Polish family. Having entered the Russian army, he managed (1762) to attract the notice of the empress by his handsome face and athletic figure; he was attached to her house-

hold, and in 1774 was preferred as her recognised favourite. From 1776, when the Emperor Joseph of Austria made him a prince of the Holy Roman Empire, till the year of his death he was the director of the Russian policy in Europe. It was at his instigation that the Khan of the Crimea put himself (1783) under Russian protection. Four years later Catharine paid a visit to his government in the south, and the 'honx' which he then played off on his sovereign is described by De Ségur (*Mémoires*). He caused an immense number of wooden painted houses to be constructed, and grouped into towns and villages along the route the empress was to take, and hired people to act the part of villagers, merchants, tradesmen, and agriculturists, engaged in their various pursuits. The empress's vanity was highly gratified at the seeming improvements of the country under her rule, and she covered Potemkin with titles and honours. Almost immediately after this a war broke out with the Turks, and Potemkin was placed at the head of the army, with Suwaroff serving under him. Otechakoff was taken after a terrible siege, and Suwaroff won the great lights of Bender and Ismail—of all of which Potemkin reaped the credit when he entered St Petersburg in triumph in 1791. That same year he was seized with sudden illness whilst travelling between Jassy and Otechakoff, and died October 15, and was buried at Kherson. He was a man of considerable ability in court intrigue and statesmanship; his skill as a general has been both affirmed and denied. Personally he was licentious, coarse in his habits, and utterly tyrannical and unscrupulous; in spite of his lavish extravagance he heaped up an immense fortune.

See *Mémoires* (Lond. 1812), and the *Life* in German by his secretary Saint-Jean (new ed. Karlsruhe, 1888).

Potential, in dynamical science, is a quantity of peculiar importance. Its value, as a mathematical function in the theory of attraction, was recognised by Laplace in the *Mécanique Céleste*. The name was, however, given by George Green (1793-1841) in 1828, when its broad dynamical significance was for the first time explicitly stated and powerfully developed. The theory of the potential, in fact, is co-extensive with the dynamics of what are known as *Conservative* systems. When such a system is made to pass from one configuration to another, the work done against the forces of the system depends only upon the initial and final configurations, and in no way upon the particular series of changes by which the passage is made. For instance, the work done against gravity in lifting a given mass to a height of 500 feet is exactly the same whether the mass is lifted vertically up, by a balloon, say, or more laboriously taken up the gentle slope of a hill. The earth and the mass form, so far as gravitation is concerned, a conservative system. Practically, however, in dragging a mass up a slope a certain amount of work, greater or smaller according to circumstances, must be done against friction, and this will depend upon the character of the course taken. We know that the work so done is lost and cannot be recovered in dynamic form (see *ENERGY*). These forces are in short dissipative, and so far as their action is concerned the system is not conservative, and the theory of the potential does not apply. A little consideration will show that when the forces are functions of distances only the system will be conservative. Such forces then have a potential; and, although this does not exhaust all types of force-systems which have a potential, it includes all that are certainly known to occur in nature around us. The force of gravitation and the force between electrified or magnetised bodies evidently

belong to the category just described. In all such cases the potential at any point in the field of force is a definite function of the position, a mathematical expression having for any particular case a definite value, such that the difference of the potentials of two points measures the work done in carrying unit quantity (of matter, electricity, magnetism, &c.) from the one point to the other (see *ELECTRICITY* for some further properties of the potential). If we take the two points very close to each other, we see at once that the small difference of the potentials must equal the product of the average force into the corresponding small distance. Thus, in the notation used in the article *Calculus* (q.v.), we have $\Delta V : S \Delta s$, where V is the potential, S the force, and Δs the small distance. Hence $S = dV/ds$ or the force in any direction is numerically equal to the rate of change of the potential per unit-length in that direction. When the potential is known a simple differentiation in any chosen direction gives the force in that direction. It is obvious that other directed quantities besides forces may be expressible as the differential coefficients of a single non-directed or scalar quantity. Thus, in the mathematical theory of Hydrodynamics (q.v.) a very important distinction is made between motions which have a velocity-potential and motions which have not. In the former the velocity can be represented as a space differentiation of a scalar quantity; in the latter it cannot. See *VORTEX* for an account of fluid motion, which has no velocity-potential.

Potentilla, a genus of plants of the family Rosaceæ, differing from *Fragaria* (Strawberry) in the fruit having a dry instead of a succulent receptacle. The species are very numerous, natives chiefly of northern temperate regions, and some of them of the coldest north—even northern Greenland; most of them perennial herbaceous plants, with yellow, white, red, or purple flowers, and pinnate, digitate, or ternate leaves. They are often called Cinquefoil (Fr., 'five-leaved'); and some of the species are favourite garden flowers.

Tormentil.

Some are natives of Britain; one of the rarest of which is a shrubby species (*P. fruticosa*), forming a large bush, with pinnate leaves, and a profusion of yellow flowers, often planted in shrubberies. *P. reptans*, a common British species, has creeping stems, digitate leaves, and yellow flowers. *P. anserina*, a very common British species, popularly known as Silverweed, has creeping stems, yellow flowers, pinnate leaves, which are beautifully silky and silvery beneath, and an edible root, with a taste somewhat like that of the parsnip. Swine grub it up with avidity, and it was once much esteemed as an article of food in some parts of

Scotland, particularly in the Hebrides, where it abounds and has been a resource in times of famine. The Tormentil (*P. erecta* or *P. Tormentilla*) differs from most species in having four sepals and four petals, though the first flowers to appear have often five. It is a very common plant on moors and heaths. So near does the genus come to *Fragaria* that *P. sterilis* (also known as *P. Fragariastrum*) is very difficult to distinguish from the wild strawberry (*F. vesca*). Sometimes included in *Potentilla* are the Marsh-Cinquefoil (*Comarum palustre*) with dusky brownish purple flowers, common in marshes, and *Sibbaldia procumbens*, a little yellow-flowered plant growing close pressed to the ground on Highland mountain-tops.—The name *Potentilla* is said to be derived from the Latin *potens*, 'powerful,' and to allude to medicinal virtues now known to merit little regard. See a monograph (Latin and German) by Wolf in *Bibl. Bot.* xvi.

Potenza (anc. *Potentia*), a town of South Italy, ensconced in a valley of the Apennines, 103 miles E. by S. of Naples. It lies on an isolated hill 2700 feet above sea-level, and is much exposed to winds; the mean temperature for the whole year is 53° F. The ancient Roman town lay lower down near the river and the railway station. The modern town contains only scanty traces of older buildings; for Potenza was shaken by earthquakes in 1273, 1694, 1812, and 1857. Pop. 18,600. The province of Potenza, called Basilicata until 1871, has an area of 3998 sq. m. and a pop. (1921) of 467,812.

Pot-holes. See GIANTS' KETTLES.

Potl, a seaport of Georgia, stands at the mouth of the river Rion, on the eastern shore of the Black Sea, 200 miles by rail W. of Tiflis. Potl was seized by Russia in 1828. Pop. 20,000.

Potidea, a Corinthian colony founded on the westernmost isthmus of the Chalcidic peninsula in ancient Macedonia. By its revolt from the Athenian League (432 B.C.) it brought on the Peloponnesian war; it was besieged and taken by the Athenians (429 B.C.) The Athenian colony which was then settled there was destroyed by Philip of Macedon (356 B.C.). Cassander built up a new town, and called it Cassandria; this flourished greatly until it was captured and sacked by the Huns.

Pot-metal. Tap and pot metals are alloys of copper and lead. The proportions of the two metals vary from equal parts of each to 1 of copper and 10 of lead.

Poto'mac, a river of the United States, formed by two branches which rise in the Alleghany Mountains in West Virginia, and unite 15 miles SE. of Cumberland, Maryland, from which point the river flows in a generally south-easterly course 400 miles, and falls into Chesapeake Bay, after forming an estuary nearly 100 miles long, and from 2½ to 7 miles wide. The largest ships can ascend to Washington, and the tide reaches Georgetown. A few miles above Washington the river forms a cataract 35 feet high; and between there and Westport it falls more than 1000 feet. The scenery in this portion of its course is wild and beautiful, especially where it breaks through the Blue Ridge at Harper's Ferry. Its principal affluents are the Shenandoah, Cacapon, and Monocacy. The Potomac forms the greater part of the boundary between Virginia and Maryland.

Potoroo. See KANGAROO RAT.

Potosi, capital of a department of the same name, and one of the most famous mining-towns of South America, stands in a dreary and barren district, nearly 50 miles SW. of Chuquisaca. It is built on the side of the Cerro de Potosi (15,381 feet), at an elevation of 13,000 feet above the sea,

and is thus one of the loftiest inhabited places on the globe. The town has a circumference of some 4 miles; but fully one-half is composed of tottering and ruined buildings, uninhabited and desolate, and the whole place, with its squalor, dilapidation, and dirt, presents a sinister aspect. The public buildings include a handsome cathedral, a mint, the Government Palace, and the Municipal Palace; and the reservoirs are also worthy of mention. The streets are steep and narrow, suitable only for llamas and mules. The climate is very trying; all the four seasons may be experienced in one day, but usually it is bitterly cold, owing to the elevation and to the mountains all round, from which the snow scarcely ever melts. Yet is Potosi one of the principal commercial towns of Bolivia. As the country in the vicinity produces little or nothing, all supplies have to be brought from a distance. The industry of the place is limited to silver-mining. The Cerro is still rich in this ore, although the production, owing to the exhaustion of the mines near the summit, and the frequent mishap of water in those worked at a lower level, has greatly fallen off. Potosi, founded in 1545, had, in 1611, 160,000 inhabitants, now about 30,000.—The department, a plateau rich in minerals and cattle, has an area of 50,000 sq. m. and a pop. of half a million.

Pot-pourri (Fr.), a mixture of sweet scented materials, usually placed in a vase with a perforated lid, that the perfume may be diffused. The principal ingredients are rose-petals, lavender flowers and stalks, violets, jessamine-flowers, woodruff-leaves, cloves, orris-root, pimento, musk, sandalwood-raspings, cedar-shavings, &c. But it also, and originally, signifies a dish of different sorts of viands, and corresponds in this sense to the *Hotch potch* (q.v.) of Scotland and the *Olla Podrida* (q.v.) of Spain. In Music the name is used for a selection of popular pieces strung together without much arrangement—a kind of medley.

Potsdam, chief town of the Prussian province of Brandenburg, was the second residence town of the royal family of Prussia. It lies on the lake-like river Havel, 18 miles by rail SW. of Berlin. It is a handsome city, with broad streets, public gardens, adorned with statues of Prussian soldiers, and fine squares. The royal palace (1667-1701), in the park of which are statues of Frederick-William I., Alexander I. of Russia, and Generals Blücher, Gneisenau, Kleist, and Tautenzien; the town-house, a copy of that at Amsterdam; and the military orphanage are the finest of the public buildings. The garrison church, with a steeple 290 feet high, contains the tombs of Frederick-William I. and Frederick II.; and the Friedenskirche the tombs of Frederick-William IV. and the Emperor Frederick III. The Brandenburg Gate is a copy of Trajan's Arch at Rome. In the immediate neighbourhood of the town are more than half-a-dozen royal palaces, as Sans-Souci (1745-47), the favourite residence of Frederick the Great, surrounded by a splendid park and gardens, containing Rauch's monument to Queen Louise and other structures; the palace of Friedrichskron, formerly the New Palace (1763-70), with nearly 200 rooms, many of which contain costly works of art; Charlottenhof, built by Frederick-William IV. in 1826; the Marble Palace, the summer residence of the Emperor William II.; and Babelsberg, the private property of the same prince. Potsdam has an observatory. Its manufactures produce sugar, chemicals, harness, silk, waxcloth, beer, &c. Flower-gardening, especially of violets, is a busy industry. Alexander von Humboldt was a native. It owes its creation as a town to the Great Elector, Frederick-William, and to Frederick II. Prior to

that period it was a fishing-village, built on the site of an ancient Slav settlement. Pop. (1925) 64,093.

Potsdam Beds, a name given in North America to the uppermost division of the Cambrian or Primordial strata.

Porstone, *Lapis ollaris* of the ancient Romans, a massive variety of talc-schist, composed of a finely-felted aggregate of talc, mica, and chlorite. It is generally of a grayish-green colour, sometimes dark green. It occurs massive, or in granular concretions. It is soft and easily cut when newly dug up, greasy to the touch, and infusible even before the blowpipe. It becomes hard after exposure to the air. It is made into pots and other household utensils, which communicate no bad taste to anything contained in them, and when greasy are cleaned by the fire. It was well known to the ancients; and Pliny describes the manner of making vessels of it. It was anciently procured in abundance in the isle of Siphnos (Siphanto), one of the Cyclades, and in Upper Egypt. Large quarries of it were wrought on the Lake of Como, from about the beginning of the Christian era to 25th August 1618, when they fell in, causing the destruction of the neighbouring town of Pleurs, in which it was wrought into culinary vessels, slabs for ovens, &c. It is quarried in the Valais, Moravia, Norway, Sweden, Greenland, near Hudson Bay, &c.

Pott, AUGUST FRIEDRICH, a great philologist, was born at Nettelrode in Hanover, 14th November 1802. He studied philology at Göttingen, habilitated at Berlin in 1830, in 1833 became extraordinary, in 1839 ordinary professor of the Science of Language in the university of Halle. Next to W. Humboldt, Bopp, and Grimm, the name of Pott stands prominent in the new science of comparative philology. The foundation of Pott's reputation was securely laid by his *Etymologische Forschungen auf dem Gebiet der Indogermanischen Sprachen* (2 vols. 1833-36; 2d ed. 6 vols. 1859-76), a work second in importance only to Bopp's *Comparative Grammar*. His well-known article 'Indogermanischer Sprachstamm,' in Ersch and Gruber's *Encyclopædie*, is a masterpiece of condensation, and for once of order. For his besetting fault was a lack of order and perspicuity, which made Ascoli compare his books to the plain of Shinar after the confusion of Babel had taken place. But no student ever brought to his studies a loftier spirit of devotion, or collected more massive materials for the foundation of a new science. So thorough was his treatment that all the progress of learning since has not stripped the value from his books on the Gypsies, on Personal Names, on Numerals, his essays on Mythology, African Languages, or General Grammar. He died at Halle, 5th July 1887, working to the last.

His most important books, besides those already named and countless articles and papers in the learned journals, are *De Borussia-Lithuaniæ tam in Slaviciæ quam in Letticiæ Linguis Principatu* (1837-41); *Die Züge von Europa und Asien* (2 vols. 1844-45); *Die Numere und Vigesimalzahlmethode bei Völkern aller Welttheile* (1847); *Die Personennamen* (1853); *Die Ungleichheit der menschlichen Rassen, hauptsächlich vom Sprachwissenschaftlichen Standpunkt* (1856); *Doppelung als eine der wichtigsten Bildungsmittel der Sprache* (1862); *Antikaulen, oder mythische Vorstellungen vom Ursprung der Völker und Sprachen* (1863); and *Die Sprachverschiedenheit in Europa, an den Zahlwörtern nachgewiesen* (1868).

Pottawattamies, a tribe of American Indians, belonging to the Algonquin stock. The early French settlers established a mission amongst them at Green Bay, and to this day many of them are Roman Catholics. They sided with the English both during the Revolution and in the war of 1812, and afterwards settled in Kansas.

Potter, JOHN (1674-1747), an English scholar and divine, son of a linen-draper of Wakefield, studied at Oxford. He was appointed chaplain to Queen Anne in 1706, professor of Divinity at Oxford in 1708, Bishop of Oxford in 1715, and in 1737 archbishop of Canterbury. Potter's principal work is his *Archæologia Græca* (2 vols. 1698), not superseded until the appearance of Smith's *Dictionary*. He edited *Lycophron* (1697) and *Clemens Alexandrinus* (1715).

Potter, PAUL, the greatest animal-painter of the Dutch school, was born at Enkhuizen in 1625, and was the pupil of his father, Pieter Potter, a landscape-painter, with whom in 1631 he came to Amsterdam. He was also an excellent etcher, and so precocious that his best etched pieces, 'The Herdsman' and 'The Shepherd,' were finished in 1643 and 1644 respectively. He established himself at the Hague in 1649, where next year he married the daughter of an architect, but in 1653 he returned to Amsterdam. He died there in January 1654 at the untimely age of twenty-nine. His best pictures are pastoral scenes with animal figures, the life-size 'Young Bull' (1647, at the Hague) being especially celebrated. The Rijks Museum at Amsterdam possesses the 'Bear-hunt' and seven other pictures from his easel. Very many of his productions are preserved in England.

See *P. Potter sa Vie et ses Œuvres* by Van Westrhoeen ('The Hague', 1867), and Cundall, *Landscape Painters of Holland* ('Great Artists' series, 1891).

Potteries, THE, a district in North Staffordshire, 9 miles long by 3 broad, the centre of the earthenware manufacture in England, includes the county borough (1910) of Stoke-on-Trent, Newcastle-under-Lyme, and other towns.

Pottery. This term, derived through the French *poterie* from the Latin *potum*, 'a drinking vessel,' is applied to all objects of baked clay. Pottery may be said to be almost contemporaneous and co-extensive with mankind; it is found with the remains of our remotest ancestors, and it is fashioned amongst the rudest of present day tribes. The art in its rudimentary condition—merely moulding wet clay into the desired form, and submitting it to the hardening heat of the sun or of fire—is so simple as to be within the capacity of the least tutored savage. The universality of the primitive art, and the many different lines along which it progressed, preclude the possibility of tracing its history in chronological sequence, and only a few of its more important developments can be noticed in the historical section.

Pottery as known at the present day is distinguished into many classes according to the nature and purity of the clay employed, the heat to which it has been exposed in firing, the glazes or enamels with which it has been covered, and the coloured or other ornamental treatment of its surface. Briefly, as regards material and baking it may be divided into (1) earthenware, which, exposed to a comparatively low heat, remains earthy in texture and can be scratched with a steel point; (2) stoneware, fired at a high heat, hard, dense, compact, and not scratched by the knife; and (3) porcelain, fired at the highest temperature, semi-fused and vitreous in structure, and, when sufficiently thin, translucent. Whilst these are convenient and universally recognised distinctions, it must be pointed out that a continuous and unbroken sequence really exists from the coarsest sun-dried brick up to the most delicate translucent hard porcelain. In point of body, hardness, and colour, each class of pottery gradually merges into the other, so that it cannot be said where earthenware ends and stoneware begins.

Manufacture.—The dough-like condition into

which clay can be worked with water, and the hardness and indestructibility it acquires by burning, are the qualities upon which the potter's art essentially depends. Clay is one of the most abundant of substances, but it is of many qualities and degrees of purity. The commonest brick clays are so coarse in texture and so impregnated with iron and other foreign ingredients that they can be used only for bricks, tiles, and the very coarsest kinds of pottery. The purest potters' clay, known as china-clay or Kaolin (q.v.), is formed by the decomposition of granitic rocks. It consists essentially of the hydrated silicate of alumina with small proportions or traces of one or more of lime, potash, soda, and magnesia. The finest china-clay of Great Britain is found in Cornwall, where it was discovered at Carclaze, 2 miles N.E. of St Austell, between 1755 and 1758 by William Cookworthy. Cookworthy's discovery was of the utmost importance for the home manufacture of porcelain and fine pottery; and the development of the industry which took place under Josiah Wedgwood and others was due in no small measure to the fine material which thus became available to them. Commoner potters' clay or pipeclay is obtained principally from Poole in Dorsetshire. The materials which form the 'paste' or body of pottery vary according to the quality of the desired product. *Earthenware* (called also Faience) of the commoner quality may be made of a simple natural clay; but the finer and harder qualities are composed of pipeclay with varying proportions of calcined flint or other siliceous material. Calcined flint was first introduced about 1720 by John Astbury at Burslem. *Stoneware* is fired at a high temperature, which semi-fuses the body, rendering it impermeable to liquids. It comprises a wide variety of products in quality and application, from drain-pipes, bottles, graybeards, and jars to fine salt glaze-ware and the 'gres' of Germany. According to quality, common or fine clays are employed, mixed with felspar, sand, and usually a small proportion of lime. *Porcelain* (derived from the Italian *porcellana*, the cowrie-shell, owing to the similarity of the white glazed surface of the ware

Fig. 1.

to the substance of that shell) is of two kinds—soft paste (*pâte tendre* of the French) and hard paste, or true Chinese porcelain. Of soft paste porcelain, again, two varieties fall to be distinguished, the French or Sèvres soft paste, which was also the 'china' of England in the 18th century, and the bone porcelain, which has been the 'china' of the United Kingdom since the beginning of the 19th century. Sèvres body is composed of equal parts of kaolin and white sand, with about 4 per cent. of chalk. Bone porcelain, the characteristic English product of the present day, may be regarded as a fine earthenware to which a proportion of calcined bone or phosphate of lime has been added, thereby producing translucency in firing. In 1800 this variety of porcelain was introduced by Josiah Spode (1754-1827). Hard paste or Chinese porcelain may be composed of equal parts of china-clay and pure white sand, with a small proportion of chalk. Its hardness and power of resisting heat make it

invaluable for chemical and industrial uses. The ingredients, such as clay and calcined flints, are prepared by separate means, the former in the pug-mill, which is represented in fig. 1. This is an upright, iron-bound, wooden cylinder, with an axis, A, turned by machinery; projecting from A are seven arms, B, each of which has three knives fixed in it, with the points outward, and so arranged that they spread over the largest amount of space in the interior; and altogether they are placed in a spiral manner, so that when in motion the clay, which is thrown in lumps into the hopper-shaped upper part of the vat, is worked down, and is so cut and kneaded by the knives that it is forced out at an opening at C in the state of soft pap. This is aided by the knives on the lower part of the lowest arm being connected together by a plate D, which prevents all settlement at the bottom. This pap-like clay passes into a large wooden tank, in which it is agitated with water until quite incorporated, so as to resemble milk in color and consistency. In another mill (fig. 2), of a different construction, the Cornish granite and calcined flints are reduced to a somewhat similar state. This mill is very strongly constructed, and consists of a tub-like vat, A, in the centre of which turns an axle, B, moved by machinery; in the bottom of the vat is a thick stone bed, C, consisting of either chert or horn stone. From the upper part of the axis three strong arms, D, D, D, project like the spokes of a wheel; and strongly attached to these are stout beams, E, pointing downward, and nearly touching the stone-bed, C. As the axis, with its arms and beams, turns round, the beams push some large masses of the Cornish granite or of chert stone round with them, and these triturate the calcined flints and other hard materials, and

Fig. 2.

stir up the water with which the vat is kept constantly supplied, whilst it overflows in a milky state, charged with the finely-divided materials, into a cistern, where it is kept stirred until it is sufficiently supplied with the solid materials, and the thickened milky liquid is then drawn off, in proper proportions, into a vat to which the prepared clay is also passed. The mixture of the two is then allowed to subside until the water is nearly clear, when it is drawn off; and the sediment is deprived of its surplus moisture, either by evaporation, or, in the best works, by a pneumatic exhausting apparatus, which does it very quickly. The composition is then a fine plastic material of the consistency of tough dough, and is ready for the potter's use. In preparing the finer materials for porcelain many other operations are required, all, however, having the same object—viz. the extremely minute division of the substances used.

The prepared clay is taken to the *throwing-machine*, or *potter's wheel*, which is represented in fig. 3. This consists of a fixed table, A, through which passes the axle, B, rising a little above the surface, and having on its upper end a disc, C,

which revolves with it. The axle is put into rapid motion by turning the fly-wheel, D, either by hand or machinery; and this causes a rapid revolution of the disc, C, upon which is placed the soft mass of clay to be moulded. At E is seen an upright, with a small sliding-bar regulated by a screw; this is

Fig. 3.

the guide for the potter to regulate the height of the vessel he is making. When the lump of clay is revolving, the potter, with his hands or with proper tools, fashions it into any rounded form he desires, gradually working from the base upwards till the vessel in his hands attains the external shape, height, and thickness of wall required. It is then put aside for some time to dry, and when in a state of greatest doughy tenacity it is fixed on a turning-lathe, and by means of sharp steel tools its surface is accurately turned and smoothed. But some articles are formed in moulds, the moulds being made of plaster

Fig. 4.

Fig. 5.

Fig. 6.

of Paris. This answers well for fine porcelain intended to be very thin, because the plaster-mould absorbs much of the moisture in the paste, and thus partially dries it, so that it admits of handling, which in a softer state would be very difficult. The paste is used so liquid that it can be poured into the moulds. It is usual, in casting, to have a mould for each part, as seen in figs. 4, 5, 6, which represent the body, neck and lip, and foot of the cream-ewer, fig. 7. The handle is also separately moulded, and attached with the aid of a fluid clay paste, called a slip. For nearly flat articles, such as dinner-plates, a plan is adopted which combines both processes: a mould, usually of plaster, fig. 8, *a*, is placed on the disc of the throwing-wheel, *b*, and a thin layer of the paste is pressed on to it, so as com-

Fig. 7.

pletely to take its form; then to the guide-post, *c*, is attached an arm, *d*, with a small brass plate,

Fig. 8.

c, on its lower side. This plate is cut to the outline of half the plate, or dish; as it revolves, this pares down and shapes the clay to its own outline, and to the thickness to which it is set, there being an arrangement on the arm of the guide-post by which this can be effected. Sometimes, as in the case of deep vessels, moulds are used for the exterior, and the interior is formed by the hand. This process (fig. 9) ensures certainty of size and shape, which is important in making large numbers of similar articles, as tea-cups, &c. The mould is lined with a thin cake of clay, and when placed on the revolving disc it is fashioned inside by hand, and finished off with a wet sponge. Sometimes metal or horn tools are used for pro-

Fig. 9.

ducing mouldings and other raised ornaments, or for grooves, when the turning or throwing wheel is used.

Being formed, the articles, of whatever kind, are now taken to the drying-stove, where they are placed on shelves, and remain there some time, exposed to a heat of about 85° F. When quite dry, they are next taken to a workshop near the kiln, and they are here carefully packed in coarse earthenware vessels, called *seggars* (fig. 10), which are so made that they can be piled upon one

Fig. 10

another to a great height in the kiln, as seen in fig. 11, in which some of the seggars are shown in section, for the purpose of making the arrangement

intelligible. As the seggars are generally made large enough to hold a number of articles, which would, when highly heated, adhere if they touched, a number of curiously shaped pieces of burned clay are used for placing between them, so as to make them rest on points; these are called *watches*, *cockspurs*, *triangles*, *stiffs*, &c. (fig. 12). In the seggar filled with plates (fig. 13) the plates are seen each resting on *cockspurs*, which prevent them touching. Another object is gained by this in burning flat articles such as plates; these, if placed one upon another, would not be fired equally, but when they are held apart the heat affects all parts alike. The seggars are so piled in the kiln that the centre is hollow, and there are free spaces between them through which the fire can ascend; props, *a, a, a*, fig. 11, being so placed as to keep them from immediate contact with the sides all round. Thus each seggar forms a small oven, in which one or more pieces of pottery or porcelain are baked, and the seggars prevent any unequal heating of the pieces, and also protect them from smoke. A kiln has generally eight furnaces, and it is usual to raise six piles of seggars between every two furnaces, or rather between their flues, which rise to a considerable height in the kilns. Each pile of seggars is technically called a *bang*, so that there are generally forty-eight or fifty bungs to the charge of a kiln. When all this is arranged the furnaces are lighted, and great care is taken to

ware, and are ready for any pattern they may be intended to bear, and the glaze. Here, however, it may be stated that it is possible to glaze refractory pottery, such as stoneware in the biscuit oven, and

Fig. 12.

thus avoid the necessity for two firings to the ware. The glazing is in this case effected by throwing common salt into the oven when at its highest temperature. The salt is volatilised and the sodium separates from the chlorine, and, combining with the silica it finds in the heated ware, forms a true soda glass with it, which makes a uniform transparent glazed layer over all the pottery surfaces which it reaches. In this way all glazed sanitary wares and ordinary stoneware jars and bottles are made at one firing. Common pottery is often figured by printing the design in enamel

colours on transfer-paper, and, whilst the printing is still wet, applying it to the biscuit-ware; the ware absorbs the enamel ink, and the paper is removed by water, leaving the pattern on the ware. It is next fired in seggars, or a muffle, to fix the colour, and is then dipped into composition

Fig. 13.

called *glaze*, of which three kinds are used in the Staffordshire potteries. The first, for common pipeclay ware, is composed of Cornish granite, 16 parts; flint, 36 parts; white-lead, 53 parts; and cullet, or broken flint-glass, 4 parts. These materials are triturated with water, with the same care and by similar means to those employed in forming paste, and are reduced with water to the same milk-like liquidity. Each workman has a tub of the glaze before him; and as the articles of biscuit-ware, either with or without

decorations, are brought to him, he dips them in the glaze, so as to ensure a uniform coating over them; and by nice management he prevents any large drops or accumulations on one part more than another. The porous biscuit ware rapidly absorbs the moisture, and dries up the thin film on the surface of the articles, which are again placed in seggars, and carried to the glaze-kiln, where they undergo another firing, which melts the glaze, and converts it into a trans-

Fig. 14.

use the best coal, as it enables the manufacturer to make a more certain calculation as to its effects, and is less liable to smoke and sulphurous vapours, which might injuriously affect the contents of the kiln. The baking or firing usually lasts from forty to forty-two hours. The fire is then allowed to go out, and the kiln to cool very gradually, after which it is opened, and the seggars removed, to be unpacked in a separate workshop.

The articles are now in the state called biscuit-

parent glass all over the surface, and renders any pattern previously printed upon it very plain. The temperature in the glaze or enamel kiln is only

increased very gradually, and is kept up for about fourteen hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far, this description has applied to the manufacture of pottery and porcelain on a large scale, for general purposes; but when it is applied to more costly and artistic works very special arrangements are required; and in the case of remarkably fine pieces, instead of the huge kilns, which hold frequently many thousand pieces, muffle furnace (fig. 14) are used for each separate article for the biscuit, the glaze, and the coloured and gilded decorations, which, in porcelain, are applied to the glaze, and not on the biscuit.

In the decoration of painted pottery and porcelain the colours employed are coloured glasses ground to impalpable powders, and mixed with borax or some other fluxing material. For use they are generally made liquid with oil of spike, and they are laid on with hair-pencils, in the same way as oil-colours. The whole process is exactly the same as in painting or staining glass; the glaze on the biscuit-porcelain being true glass, and the enamel colours being exactly the same as those used by the glass decorator. The colours may be made by mixing the materials of which glass is made with the colouring material and the flux, or simply with the already coloured glass and the flux. When the former plan is employed the principal colouring materials made use of are oxide of chromium for green; oxide of iron for red, brown, violet, gray, and yellow; oxide of manganin for orange, yellow, black; oxide of manganese for violet, brown, black, and purple; oxide of cobalt for blue, gray, and black; oxide of antimony for yellow; oxide of titanium for yellow; oxide of copper for green; suboxide of copper for red; sesquioxide of iridium for fine black; protochlorate of iron for brown; chromate of lead for yellow; chromate of barytes for yellow; chloride of silver for deepening reds and purples; purple of Cassius for ruby and purple. Several of these colours are much increased in brilliancy by the addition of oxide of zinc, which of itself gives no colour; and the transparent ones are rendered opaque by the addition of oxide of tin.

Other fluxes besides borax are used—as sand, felspar, boracic acid, minium or litharge, salt, saltpetre, potash, and soda. For the gilding of pottery gold-leaf is rubbed down with oil of turpentine; or metallic gold is produced by precipitating the metal from its solution. The finely-divided gold so obtained is washed and dried, and then worked up with one-sixteenth of its weight of oxide of bismuth and oil of turpentine, painted on, fired, and afterwards burnished.

HISTORY.—Primitive pottery, both present-day and prehistoric, shows forms and decorations derived from other utensils, baskets, vessels of leather and wood, gourds, and so on. The derivation may be direct, if, as may well be, the accidental burning of a clay daubed basket suggested both the invention and the ornamentation. It is pretty well agreed that western Europe had no pottery till the coming of the Neolithic Alpine people. But by that time the Near East had several very highly developed cultures in which pottery had an eminent place.

Egyptian.—The Nile valley pottery is found buried at a depth which may indicate a date about 10,000 or 15,000 B.C. That the Egyptians attained considerable skill as potters is attested by the lustrous red ware they made for holding perfumes, wine, honey, and other delicacies; but their most remarkable pottery was their so-called porcelain made of a fine sand or frit covered with a thick siliceous glaze, known from pre-dynastic times, blue, green, white, purple, or yellow in colour.

The blue colour—which is that first and principally employed—was produced by an oxide of copper which yielded tints of unrivalled beauty and delicacy. This famous porcelain was at its best in the 18th dynasty (about 1600 B.C.), and continued to be produced till the period of the Greek and Roman rule. It was fashioned into vases, sepulchral figures of deities, scarabæi, beasts, &c.; and it must have attained a great reputation, for remains of it are found in most of the ancient countries which had commerce with Egypt. The glazed tiles of King Zoser's time (3d dynasty) are worthy of note.

Elamite, &c.—Competing with Egyptian for priority—though some would date it 4500 or even as late as 3000 B.C.—and excelling it in art, is the oldest ware of Susa. This ware is very thin, with geometrical or stylised designs in lustrous black. The wheel may have been used. A similar culture is seen at Amu (Turkestan) and elsewhere.

Red Ware.—About the time of the introduction of copper a red ware appears in Cyprus, Syria, and Asia Minor, where it superseded earlier black wares with incised designs filled with white. A similar succession is found in the Danube basin.

Assyrian.—In the empires of Assyria and Babylon pottery was also in use at an early period. Sun-dried and kiln-dried bricks were made very early, and like Egyptian bricks these were stamped with the names and titles of the reigning monarchs, and the locality for which they were destined. Glazed bricks of various colours, occasionally enriched with figures of men and animals, were introduced into constructions, and Semianis is said to have adorned with them the walls of Babylon. In

these bricks we have the earliest example of the employment of materials for colouring like those now in use. The glaze, however, is largely siliceous, but tin-glazed polychromatic bricks were also used in the construction of the walls of the palace of King Darius at Susa. These bricks were moulded so as to build together into regular geometrical patterns, colossal figures of men, &c. in high relief. Remarkable for size are the large coffins found at Warka. The Assyrians and Babylonians used terra-cotta for historical and legal purposes, making cylinders, hexagonal prisms, tiles and tablets of it, on which were impressed extensive writings in cuneiform characters. See BABYLONIA, CUNEIFORM.

Minoan.—The succession of styles in Crete is so fully dealt with under that head that it need not be repeated here.

Greek.—The most remarkable pottery of antiquity was the Greek, which in its earliest development draws its inspiration from Minoan and Mycenaean. The Greek vases which remain to this day, principally recovered from tombs in Greece and in the lands to which its commerce extended, show that within a few centuries the art rose from the rude condition like that shown in prehistoric pottery till it reached a perfection and variety of form and a grace and dignity of decoration not since attained by the efforts of any people. It was the triumph of pure art, for the material of which the body of Greek vases is fabricated is of the commonest type, and the colours the artists had at their disposal were few and simple. The archaic pottery of the Greeks down to about the 7th century B.C. was like the rude earthenware of prehistoric times. Their first improvement consisted in the application of a brown glaze to the surface of the ware, which enabled them to give force to

Fig. 15.—Unglazed Egyptian Bottle in the British Museum.

the incised ornament, scratched through the glaze into the differently coloured body. Next the potters discovered black pigment which they could apply over the brown glaze, and thus increase their decorative resources by painting geometrical patterns in black. By degrees the purely geometrical forms of ornament were abandoned, and figures of animals, rising ultimately to the human figure, were painted in black silhouette on the vases, some of the details being touched with white and purple. In the case of the human figure faces and limbs began to be expressed in white and colour on

superabundant, and the proportions of the vases became exaggerated and bad. Subjects themselves were no longer lofty and heroic, but connected with incidents of everyday life, with burlesque drama, and with juggling.

Since 1873 a great number of terra-cotta figurines or statuette figures and groups have been excavated from tombs at Tanagra in Boeotia; subsequently a very important find was made at Myrina on the coast of Asia Minor, opposite the island of Mitylene, and at Tarentum, Corinth, the Crimea, Cyprus, the Cyrenaica on the African coast, and in other localities quantities of such figurines have been obtained. They consist principally of single figures and groups of draped females and young girls; subjects drawn from the everyday life of the people, treated with true Attic grace and simplicity, and with marvellous sculptural feeling. In the Myrina series, which obviously have a different inspiration, deities and heroes of mythology form the most important element.

Etruscan.—From the fact that much Greek pottery has been found in Etruscan tombs, this ware came to be popularly known as Etruscan pottery. True Etruscan pottery, however, was rarely painted. The most characteristic ware of that people, with a body black throughout, had on its surface moulded ornaments, the shape and ornamentation showing that it was modelled on oriental metal work. This black Etruscan ware, which was in use from 500 to 320 B.C., was the source from which subsequently arose the Arretine and so-called Samian ware of Rome.

Roman. The only important development made in pottery under Roman rule beyond an enormous production of lamps was this Arretine or Samian ware. It is evidently imitated in its decoration from works in metal, in all probability from the chased cups of silver and gold which began to come into use in Italy, and was a continuation of the later moulded wares of Greece and Italy. The Samian ware of the Romans, so called from having originated in the island of Samos, was of a bright red colour throughout, but covered

Fig. 16. Greek Krater, Amphora and Kylix of later style.

the black figures painted on a red ground. Concurrently, the rough clay body of the vases began to be wholly or partially covered with an engobe or slip of clay of much finer quality and colour, the engobe being applied by dipping the moulded article into a vessel containing the slip. With these developments in material and decorative variety the forms of the vases and the skill of the artist draughtsman show steady and continuous development. Just as the best period in Greek art approached the favourite method of vase decoration underwent a total change. The decorative figures, deities and men, were traced on their red and white clay surfaces; but, instead of the figures being filled up in black, the surrounding space—the body of the vase itself—was blackened, giving a black varnished background with figures the colour of the underlying body. The details of these figures are indicated with fine lines. Sometimes the faces and limbs are filled up in white, and the draperies may be parti-coloured. At this stage Greek pottery reached its greatest loveliness of form and perfection of ornamentation, the drawing being supremely refined, delicate, and spirited. Among the most interesting of the Greek vases which remain to us are certain of the Panathenaic amphorae—prizes won at the public games in Athens—on one side of which was painted an archaic figure of Athena, and on the other any appropriate design with the inscription: ΤΩΝ ΑΘΗΝΕΩΝ ΑΘΛΙΣΤΩΝ. In most cases also they contain the name of the archon or chief magistrate of the city for the year, in this way enabling us to find the precise date of the manufacture. The most ancient of these date from the 6th century B.C. Of ten vases in the British Museum, six bear the name of the archon, and the Louvre possesses three, which, from the archonic names they bear, can be referred to 323, 321, 313 B.C. respectively. At this period the decadence of Greek art had already set in. The drawing degenerated speedily, figures were multiplied and crowded in confusion, ornament became florid and

Fig. 17. Samian Bowl.

with a lustrous siliceous glaze. The red colour nearly resembles in appearance and texture a coarse sealing wax; the paste is often remarkably fine. The vases, generally of small dimension, were turned on the lathe; the ornaments were moulded separately, and attached to the vase; patterns were produced by the repetition of the same mould, or by placing the bas-reliefs from various moulds on the vases. This kind of pottery was first made by the Romans at Arrezzo, but subsequently, or nearly simultaneously, was produced at Capua and Cumæ in the 1st century. It afterwards extended over all the Roman world, and was made in Gaul and Germany. While under the republic it was at first extremely fine, the manufacture deteriorated under the last of the twelve

Cæsars, and the ware is no longer found under the Antonines. The names of several hundred potters are found stamped upon existing specimens of this ware, some of them evidently of Gallish origin. It was extensively imported into Britain and other remote provinces of the empire. In Britain the Roman conquerors established the manufacture of pottery in many localities, making use of the native clays. The ware was generally of inferior quality, but that of some places is sufficiently distinctive; and the discovery of kilns and fragments enables us to associate certain localities with distinct classes of pottery. Thus, a black ware was made at Castor in Northamptonshire, which was ornamented with reliefs laid on by depositing a fluid clay on the wet body, and moulding it with a tool. Characteristic ware was also made under Roman influence at Upchurch in Kent, and near Crockhill in the New Forest, Hampshire.

Rhodian and Hispano-Moresque.—The knowledge of glazes originally acquired by the Egyptians and Assyrians was continued and transmitted to the Persians, Turks, Arabs, and Moors; and through oriental influence it came to be a European possession in mediæval times. An interesting, but now generally rejected, theory used to be put forward

to account for the origin of the so called Rhodian ware. Under the Knights of St John of Jerusalem, it was said, Persian potters were set to work in the island of Rhodes about the beginning of the 14th century. For about 100 years thereafter a large amount of a brilliant enamelled pottery was made, and sent out through the Mediterranean basin from that island. The pottery, somewhat Persian in form, colour, and ornamentation, is greatly treasured under the name of Rhodian ware. This ware is now held to have emanated mostly from Turkey, partly from Syria (Danassus ware), and is of the 16th and 17th centuries. Some centuries earlier there was planted, under Moorish influence, on the Spanish peninsula

Fig. 18.
Hispano-Moresque Vase.

and in the Balearic Islands, the manufacture of the famous Hispano-Moresque enamelled faience, which is specially remarkable for the brilliant metallic lustre of its glaze. The most famous specimen is the Alhambra Vase at Granada. The industry continued to flourish till the final expulsion of the Moors from Spain early in the 17th century, after which it rapidly fell away. From the island of Minorca especially a vast trade in this ware was carried on; and the name 'Majolica,' given by the Italians to their own more famous enamelled pottery, is an indication of the predominant importance of the ware, usually made at Valencia, sent out from Majorca in the middle ages.

Italy.—Probably the production of brilliant enamelled pottery simultaneously in the East and the West—in Persia, Danassus, and Turkey on the one side, and in the Spanish peninsula on the other, exercised a powerful influence on the origin and progress of the same art in Italy. But there, under the contemporaneous renaissance of art generally, the decoration of the pottery assumed a distinctively European character, and it attained a much greater freedom, wealth, and variety of decorative resource than was reached by any of its

predecessors. The fine white enamel glaze yielded by tin was used by Italian potters of the early 14th century, and from this time onwards the application of this tin enamel to earthenware became very common in Italy. Decorations were painted on the enamel, and later a lustre was sometimes added; it is to such pottery that the name Majolica properly belongs. One of the most famous of the many artists who produced this ware was Giorgio Andreoli, commonly known as Maestro Giorgio,

Fig. 19.—Deep Dish, by Giorgio.

who worked at Gubbio during the first half of the 16th century. His pieces, Gubbio ware, are distinguished by a remarkable iridescence, flashing ruby, golden, and opaline tints of marvellous brilliancy with every variation of light. Among the most famous centres of Majolica production in Italy besides Gubbio were Faenza, Siena, Urbino, Castel Durante, Deruta, Pesaro, Forlì, and Venice. The artistic value of the products declined with the waning of art in Italy in the 17th century.

France.—From Italy the art of making enamelled faience passed in the early 16th century into France, and tiles for the château of Écouen were manufactured at Rouen about 1542, probably by Masseot

Fig. 20.—Palissy Dish, La belle Jardinière.

Abaquegne. Faience factories were set up by Italians in the second half of the century at Lyons, Nantes, Nîmes, and at Nevers, where the Conrade brothers from Albissola became famous as master-potters. Bernard Palissy (q.v.) in 1556, after unheard-of exertions, independently discovered an

enamel glaze, which he applied to his characteristic rustic dishes, embellished with exquisitely moulded figures, in high relief, of fishes, reptiles, fruits, and other figures. Meanwhile there was being produced in France a ware which has become famous as the so-called *Henri Deux* or *St Porchaire* faience. First brought into public notice in 1839, it was till 1864 known as *Henri Deux* ware, from many of the pieces containing the cipher and emblems of *Henri II.* and of *Diana of Poitiers*. Then, owing to the acceptance of a false theory of its origin, it was designated *Oirin* ware; but the pieces were more probably made at *St Porchaire* (*Deux-Sèvres*) between 1525 and 1555. *Henri*

Fig. 21.—Vase of *Henri II.* Ware.

Deux ware, of which only sixty-five pieces are known, consists entirely of decorative pieces treated in an architectural manner, the body of the ware being a creamy pipeclay, with inlaid ornamentation in colour, and beautifully modelled masks, trusses, &c., and a transparent glaze. There were three important centres in France during the 17th century—*Nevers*, with its oriental *bleu persan* ware; *Rouen*, with its artificiality of design and conventionalities in bright brick-red; and *Moustiers*, with its elaborations in blue or polychrome, mostly after *Bérain*. *Strasbourg* and *Marseilles* had a considerable reputation. The French industry succumbed in the 18th century to the craze for porcelain and to the competition of the new English wares.

Northern Europe.—The celebrated enamelled faience of Holland owes its origin probably to Italian influence, though its main development came with the attempts of the Dutch to imitate the oriental porcelain with which they were made familiar by their eastern trade and connections. The manufacture dates from the 16th century, but it was not till about 1650, when the town of *Delft* turned from the manufacture of beer to that of pottery, that the production of *Delft* ware, generally known as *Delft*, became important. To imitate the fine lustrous white of the ordinary porcelain body tin-enamel glaze was employed by the Dutch potters, and their coloured decorations were chiefly in blue. Some of the motives depicted were scenes from Dutch life, but much more characteristic were the Chinese and Japanese devices first introduced by *Aelbrecht de Keizer*. The industry decayed during the 18th century. Ornamental glazed stone-tiles were made in Germany from an early date, while the later 16th century saw the production in *Nürnberg*, *Salzburg*, &c., of the famous *Hafner* ware of quaintly decorated

and coloured jugs. In the 17th century *Hamburg* produced a blue and white spiral ware, and in 1661 two Dutchmen established a flourishing factory at *Hanan*, turning out jugs showing Dutch and Chinese influence in decoration. Other important centres were *Nürnberg*, *Frankfurt-am-Main*, and *Bayreuth*. Stoneware *Bellarmines* or *Grey-beards* (q.v.), and the tall beer-jugs of the Germans usually decorated with moulded ornaments, medallions and inscriptions, &c., although generally spoken of as *Grès de Flandres*, are really almost exclusively of German origin, and may be traced, according to their colour and quality, to *Cologne*, *Siegburg*, *Frechen*, *Raeren* (associated with the name of *Jan Emens*), *Grenzhausen*, *Höhr*, and to *Kremsdonk* in *Bavaria*, &c. Scandinavian faience has of late come to occupy a position of some importance. *Johann Wolff*, a shiftless native of *Holstein*, founded two factories which have become famous—*Store Kongensgade* in *Copenhagen* (1722) and *Rörstrand* in *Stockholm* (1725). Their characteristic ware was blue-coloured and influenced by *Delft* and Chinese motives. Other centres of note were *Kastrip* (1749) near *Copenhagen*, and *Marieberg* (1759) near *Stockholm*. Norway's contribution is chiefly that of the factory of *Herrebøe* (1760–1772), founded by *Hofnagel*. Its productions are in the *rococo* style.

England.—There is a tin glazed dish of English make dated 1602 in the *London Museum*, and some undated pieces are doubtless earlier. During the 17th century *Lambeth* carried on a considerable industry in ‘*Delft*,’ copied from *Holland*, but otherwise the ware made in *England* was of a coarse, common description, and those who could afford the luxury obtained their pottery from the Dutch and other superior makers. The first step towards improvement was effected by *John Dwight*, who in 1671 obtained a patent for ‘making stoneware, vulgarly called *Cologne* ware,’ and by him the *Fulham* manufacture

stoneware was originated. A still more marked influence was produced on English pottery about the same time by the two brothers *Elers*, from *Holland*, who settled at *Burslem*, and there produced a ware which they called *red Japanese*. To these potters is imputed the origin of the process of salt-glazing of stone ware. Their secrets were discovered by

Fig. 22. Early Staffordshire *Tyg* or four-handled drinking-cup.

Asbury and *Twyford*, and from this time onwards improvements were introduced in the *Staffordshire* potteries under such men as *Daniel*, *Billing*, and *Whieldon*; but the great strides which for a time put English pottery in the foremost rank of the productions of the world were due to the great potter *Josiah Wedgwood* (q.v.; 1730–95). In every department, in body or paste, in methods of decoration, and in the employment of artists of the highest ability, *Wedgwood*, with mirroring application and with unstinted expenditure, aimed after perfection; his achievements in ‘*Queen*’ ware, *Egyptian* black, and *jasper* ware need only be mentioned. His efforts alone raised the manufacture of pottery in *England* to the position of an industry of national importance. Cheaper processes such as *transfer-printing* and more economical

methods enabled England to flood the Continent, especially with the cream-coloured wares, with the result that the continental faience industry was well-nigh exterminated. Away from Staffordshire potteries of some importance existed at Lambeth, Bristol, Liverpool, Leeds, Lowestoft, and Swansea; but by degrees the manufacture drew more and more towards Staffordshire, where, in the towns collectively known as 'The Potteries' (q.v.), it now principally centres. English stoneware and pottery owe much to Sir Henry Doulton (q.v.) and his works at Lambeth, in the Potteries, and near Glasgow.

Peruvian.—In the New World the art of the potter showed an interesting development among the ancient Mexicans and Peruvians before the American continent became known to Europeans. No knowledge of glazes existed among these peoples, but, in the case of the Peruvians especially, a high degree of skill in working clay was developed; and they modelled and modified animal forms with great knowledge and spirit. Their most characteristic pottery was black, but they also made vessels of a fine, warm, yellowish body, formed on the potter's wheel, and having painted decorations analogous in style to those on archaic Greek vases.

PORCELAIN.—China.—According to their own records, pottery was made in the Chinese empire in the reign of their mythical Emperor Hwang-ti about 2690 B.C. The Chinese were, moreover, the first to manufacture porcelain; but doubt exists as to the date of the earliest manufacture of porcelain as distinct from pottery. There is no proof that the new ware which appeared in the Han Dynasty (206 B.C. 220 A.D.) was porcelain, but the name can be applied to certain extant specimens dating from the Tang Dynasty (618 906). The pro-

ductions of the Sung period (960 1279) are highly prized and include the green-glaze celadon porcelain, Ju, Ting, and Chuan wares. The Ming period (1368 1643) was prolific in the blue and white and *blanc de Chine* ware. Subject to fluctuations caused by revolutionary troubles, the porcelain manufacture has continued to flourish in China to the present day, the most famous centre of the industry being King-te-chin in the province of Kiang-si. In this town alone there were at the end of the 18th century some 3000 porcelain furnaces; but the place was ruined by the Tai-ping insurrection, and the industry suffered a set-back. Chinese porcelain exhibits endless variety in form and painted decoration. The mythical dragon, the kylin or mythical lion, the spotted

Fig. 23.—Chinese Porcelain Vase.

deer, domestic fowls and other birds are favorite subjects on Chinese ware. Of all Chinese porcelain that now most sought after is the old blue ware such as was at first copied and imitated by the Delft manufacturers. Crackle ware, in which the glaze shows signs of separation from the body, is a peculiarity of oriental manufacture. The Chinese appear to possess the secret of causing the cracks in the glaze to be large or minute at will. Ruby glazed ware (the *Sang de boeuf* of the French) and rich chromatic splashed glazes are also highly treasured in Chinese porcelain.

Japan.—A knowledge of Chinese porcelain first passed into Japan at the beginning of the 16th century, when a Japanese potter went to China to acquire the art of porcelain-making, and after his return carried on the manufacture in his native country with great success. Korean potters established a flourishing industry at Arita (Hizen) in the next century. It is, however, more in the manufacture of pottery than of porcelain that the Japanese exhibit pre-eminent skill. Their most famous manufacture consists of Satsuma ware, so called from having been established in the province of that name at the end of the 16th century by the formerly powerful princes of Satsuma. It is of a pale yellowish colour, covered with minute crackles in the glaze, and very richly enamelled and gilt. The so-called Satsuma manufactured last century is yellower in colour and more elaborately decorated than genuinely old pieces, and was principally made at Awata near Kyōto. The Japanese potters generally display a remarkable power in moulding pottery and finishing its surface so as to imitate other substances, such as woods of various kinds, basket work, &c. Among their most remarkable products are examples of delicate moulding in Banko ware, which consists of small teapots and other vessels of a brownish and grayish unglazed earthenware, extremely light and thin in body, and very much appreciated among the native population for tea-making. The Japanese excel in the manufacture of egg-shell porcelain, so called on account of the extreme thinness of the body. Among their other porcelain manufactures Kaga or Kutani ware is the most outstanding, being characterised by painted ornaments in a rich ruby or green colour, which is generally lavishly gilt. The chrysanthemum is a favourite and frequent flower in their vases, the crane and other birds figure most effectively, and figures of warriors and ladies are frequently employed in the resplendent and varied ornamentation of Japanese ware. The principal centres of the pottery industry in Japan are in the province of Hizen, where at Arita is produced Imari ware; the province of Owari, whence comes Seto ware; Kaga, for ware of that name; Kyōto, where Raku-ware has been made for over three centuries; and Mino.

Persia. Chinese pottery seems to have been known in Persia as early as the Tang Dynasty, a circumstance not to be wondered at, seeing that country was then, and for centuries before, the principal highway of commerce between the far East and Europe. Many evidences exist of the acquaintance of the Persians with the ceramic products of China; this is especially evident in the blue and white wares, and in the Gombroon ware, a species of soft porcelain made in Persia and modelled both in form and decoration on Chinese originals. But Persia also had a manufacture of pottery and of enamelled tiles of an original and distinctive character, in which on a fine white enamelled glaze brilliant metallic lustres were employed in a most effective and original manner.

Porcelain in Europe.—In the 13th century Marco Polo visited the porcelain-factories of China. In 1487 Lorenzo de' Medici received from the sultan of Egypt a present of Chinese porcelain, that being the first record we possess of the appearance of the ware in Europe. The Portuguese were the first to import porcelain direct from the East; and subsequently large quantities were brought by the Dutch and by the East India Companies of other nations. No sooner did the ware become known in Europe than strenuous efforts were put forth in many quarters to imitate it. A certain amount of porcelain is alleged to have been made in Venice about 1470; but the earliest European porcelain of which any examples exist is

that which was made by Francesco de' Medici, Grand-duke of Tuscany, about 1580. The quantity of this porcelain made appears to have been small, and it is now of great value. Nearly a century later the art was revived at Ronen and at Paris, but it was not till 1693 that a permanent and well-established industry was founded in France at St Cloud. Thereafter it was taken up in Lille and Chantilly. At Vincennes it was begun in 1745; in 1753 Louis XV. became a partner in that concern. In 1756 the works were transferred to Sèvres, and in 1760 that establishment became entirely national property; and so it has continued amid all fluctuations of government to the present day. Hard porcelain was first made at Sèvres in 1764; but the fame of that establishment rests on its soft porcelain, in which body, glaze, and enamel colours blend together into a singularly smooth and lustrous whole.

But in Europe it was in Germany that the secret of making hard or kaolinic porcelain was first discovered. After years of labour and innumerable trials, which resulted only in the production of a kind of opaque glass or stoneware, Böttger (q.v.), an alchemist who had entered the service of Frederick Augustus II. of Saxony, succeeded in 1709 in making a white hard porcelain at Meissen, near Dresden. The china-clay and china-stone he employed had previously been discovered by Schorn at Aue. Extraordinary precautions were taken to prevent the process of the manufacture from being revealed; but, notwithstanding the oaths imposed on the workmen and the other means employed

for their supervision, the secret was betrayed by one Stölzel, who fled to Vienna, where the imperial factory was established in 1718. Subsequently

factories under national protection were established at St. Petersburg in 1744, at Höchst in 1746, at Berlin in 1751, and at Ludwigsburg in 1758. Works at which soft porcelain was principally made were established at Doccia near Florence in 1735, at Capo di Monte near Naples in 1743, and at Buen Retiro in Spain in 1759. The Royal Copenhagen porcelain factory was established in 1779-80, but porcelain had been previously produced in Denmark. The products of all these manufactories have attained considerable reputation.

In Great Britain, manufacturers have at all times devoted themselves principally to the making of a variety of soft porcelain. The works at Chelsea, Bow, and Derby were established about 1745, and

Dresden Candelabrum.

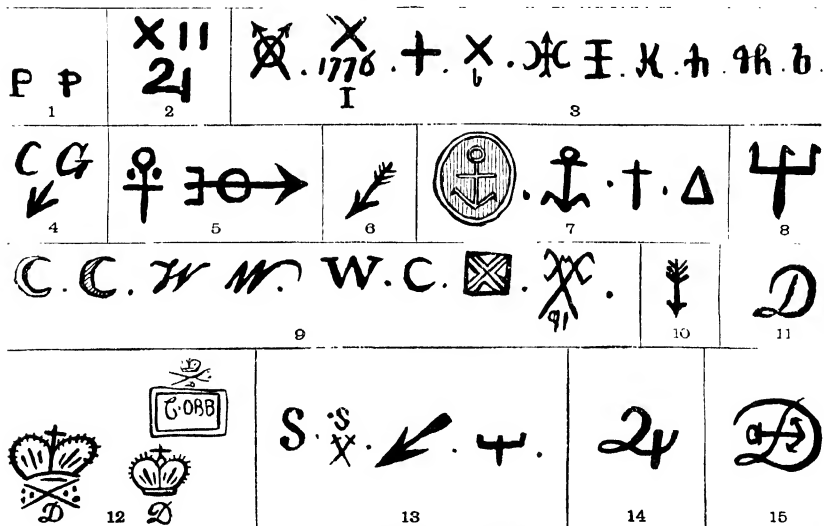

Fig. 25.—Marks on English Ware :

- (1) Pennington, Liverpool, 1760-80; (2) Plymouth, about 1760; (3) Richard Champion, Bristol, 1772-90; (4) Charles Green, Leeds, 1790; (5) Bow, 1730-90; (6) Absolon, Yarmouth, about 1790; (7) Chelsea, 1730-84; (8) Swansea, Wales, 1790; (9) Worcester, 1760-80; (10) Yarmouth, about 1790; (11) Derby, 1761-69; (12) Crown, Derby, 1780-1830; (13) Shropshire, 1772-99; (14) Cookworthy, Plymouth, 1760; (15) Derby-Chelsea, 1770.

in 1751 the manufacture began at Worcester, where it still continues. Hard porcelain-making was begun by Cookworthy at Plymouth in 1768, after he had discovered china-clay in Cornwall. But his works continued only for about three years. Cookworthy's patent rights were then transferred to Richard Champion, who continued the manufacture at Bristol till 1781. In Staffordshire porcelain was

first made at Longton Hall in 1752, but it was not till about the close of the 18th century that Staffordshire porcelain became artistically and technically fine in the hands of Thomas Minton, who founded the famous works of Minton and Company, and of Josiah Spode (afterwards Copeland and Company). In the later part of the 18th century valuable porcelain was also made at Lowestoft, Coalport,

Nantgarw, Swansea, and some other centres. The manufacture of Parian or statuary porcelain, which is an unglazed modification of English soft porcelain, was introduced by Copeland and Minton about 1846.

It is a common practice to place on pottery and porcelain distinctive marks, either painted on or stamped into the bottom of the article. These indicate either the manufactory in which the pieces were made, or the workman, and sometimes the decorator, employed on them; and in the case of Chinese and Japanese ware the marks give the dynasty or date of execution. It is only in the case of Sèvres porcelain that the habit of marking a date by letters of the alphabet was practised. In Chinese pottery date-marks are found indicating that the piece was made as far back as the Han Dynasty; but there is reason to believe that many of these early marks are forged, and at most are only copies of more ancient examples which have now ceased to exist. On some pieces of early majolica the date, place, and name of the artist are given. The great European manufactories have generally marks which indicate the place of making only; but there are other means of arriving approximately at the date. The illustrations (fig. 25) show the marks employed at various important English works; but many of the manufacturers imprinted or impressed their names in full. In connection with these marks and names it should be borne in mind that it is easier to forge marks and names than it is to produce works equal to the originals imitated, the excellence and value of which causes such forgeries to be put in circulation. A vast quantity of forged porcelain is in existence.

The literature of pottery and porcelain is exceedingly voluminous. A bibliography was first attempted by Champfleury, Curator of the Museum and Library of the Sèvres Manufactory: *Bibliographie Céramique. Nomenclature Analytique de toutes les publications faites en Europe et en Orient* (Paris, 1881). The bibliography was greatly extended by Solon in his elaborate work, *Ceramic Literature* (London, 1910). Among other standard works by Solon are *The Art of the Old English Potter* (1885); *The Ancient Stoneware of the Low Countries* (1892); *Old English Porcelain* (1903); *Italian Majolica* (1907). Important books more recently published are W. Burton, *History of Porcelain* (1921); Josiah Wedgwood and his Pottery (1922); M. M. Evans, *Early Pottery* (1920); A. L. Hetherington, *The Early Ceramic Wares of China* (1922, abridged ed. 1924); A. L. Hetherington and R. L. Hobson, *The Art of the Chinese Potter* (1924); R. L. Hobson, *British Museum: a Guide to English Pottery and Porcelain* (3d ed. 1923) and a similar *Guide to the Pottery and Porcelain of the Far East* (1924), *The Wares of the Ming Dynasty* (1923), *The Later Ceramic Wares of China* (1925); B. Raekham and H. Read, *English Pottery* (1924); *Pottery and Porcelain*, translated from the Danish of E. Hanover by B. Raekham, containing a comprehensive bibliography; M. J. Baillet, *Musée du Louvre: La céramique française, Bernard Palissy et les fabriques du XVI^e siècle* (Paris, 1924).

Pottstown, a borough of Pennsylvania, on the Schuylkill River, at the mouth of Manatawny Creek (both crossed by bridges), 35 miles WNW. of Philadelphia. It has iron and steel works (foundries, furnaces, rolling-mills, nail-factories), car-works, &c. Pop. 17,400.

Pottsville, capital of Schuylkill county, Pennsylvania, is built on the side of steep hills, on the Schuylkill River, at the entrance of Norwegian Creek, 93 miles NW. of Philadelphia. It is in the midst of a rich anthracite and iron region, and has great steel works and other industries. Pop. 22,000.

Pot-walloppers (from *pot*, and *walloper*, 'to boil or bubble'), the popular designation of a class of electors forming the constituency of various English boroughs (e.g. Taunton, Preston) before

the Reform Act of 1832, and defined in Sir James Stephen's *Commentaries* as 'such as cook their own diet in a fireplace of their own.' At Taunton in the 18th century 'several inmates or lodgers would, some little time before the election, bring out their pots, and make fires in the street, and boil their victuals in the sight of their neighbours, that their votes be not called in question' (Defoe's *Tour through Great Britain*, 4th ed. 1748).

Pouched Mouse (*Dipodomys*), a genus of small, lean, long-tailed, agile rodents, with cheek-pouches. The best-known species is *D. philippii*, from the waste regions of California, where it seems to find a sparse diet of seeds and roots, and in the dry season no drink but dew.

Pouched Rat (*Pseudostomus* or *Geomys*), a genus of plump, short-tailed, hamster-like rodents, with cheek-pouches which open externally and are used as receptacles for food. One of the best known species is *P.* or *G. burrarius*, sometimes called 'Gopher.' Like the other species it is a native of North America, and inhabits the territory east of the Rocky Mountains and west of the Mississippi. It is a burrower like the mole, active in the warm weather, hibernating in the cold, sluggish above ground, but very active in its subterranean progress. The cheek-pouches are very large, and are crammed with roots, seeds, &c., but not with earth as the Indians used to maintain. Being voracious gnawers, the pouched rats do much damage to the roots of trees and crops.

Poughkeepsie, capital of Dutchess county, New York, on the east bank of the Hudson River, 73 miles by rail N. of New York City, is finely situated on a tableland, about 200 feet above the river. The Hudson is here crossed by a steam-ferry, and spanned by an important railroad bridge. The city is well built. Its manufactures include mowing-machines, iron ware, clothing, &c. Two miles to the north is the Hudson River State Hospital for the Insane, and the city contains a number of charitable institutions. But Poughkeepsie has most reason to be proud of its educational facilities, the chief of which is Vassar College (q.v.). Poughkeepsie was settled by the Dutch about 1680; in 1778 it was the state capital, and in 1788 the New York Convention met here to ratify the constitution of the United States. Pop. 35,000.

Poultice. See OCTOPUS.

Poultice, an application to diseased or painful parts, for the purpose of promoting suppuration, relieving pain, and stimulating or soothing the skin, according to circumstances. A poultice may be composed of any moist pulpy substance of sufficient consistence to retain the water without dripping or soaking through the flannel or linen covering in which it is generally applied. The making of a poultice well is a matter of some nicety, and unless the proper consistence is given to the mass the application is apt to do more harm than good. The linseed-meal poultice is the most easily made, and most satisfactory of all soothing applications. The meal is stirred gradually into a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistence, and in quantity sufficient to cover completely, to the thickness of three-quarters of an inch, the whole pained part. The pulp is then spread on flannel, or poured into a flannel bag, and applied as soon as the heat will permit it to be borne. If it is to be applied to a wound, threatening abscess, &c., where a softening effect on the superficial tissues is desired, some antiseptic substance such as boracic acid is added, and the poultice put directly in contact with the skin. If applied for pain, or

some deeper inflammation where heat is chiefly needed, the poultice should be covered with cotton wool or several layers of flannel. It will then retain its heat longer. The bread and milk, or even bread and water or bran poultice, is also very good; as is the oatmeal-porridge poultice. Starch poultices are much used for softening and removing crusts in some skin affections. Charcoal may be used alone, or sprinkled on the surface of the poultice before it is applied, or it may be made with a non-irritating antiseptic lotion instead of plain water (e.g. corrosive sublimate, 1 to 2000). Carrot poultices are in great favour with the people in some parts of the country. Hemlock poultices, made of the fresh leaves, or of the dried leaves, with the aid of some powder of the leaves, form a valuable sedative application in painful diseases; and poppy-heads, or even opium, are sometimes infused in the water of which a poultice is made, for the same purpose. A stimulating poultice may be made by sprinkling oil of turpentine, or chloroform or mustard in moderate quantity on the surface of any ordinary poultice. When considerable irritation of the skin in a short time is desirable, a mustard poultice is used. For the danger of poulticing the eye, see EYE.

Poultry (Fr. *poule*, 'a hen'; Lat. *pullus*, 'a chicken'; Eng. *pullet*) is the term by which are known the birds brought by man into domestication, and usually embraces the ordinary fowl, ducks, geese, turkeys, and guinea-fowl. From the time when man began to abandon his nomadic manner of life and settle down into settled habitations, poultry in one form or another have been brought into subjection, taking the place of the wild birds which, when he wandered, he was able to snare or kill, but which fled from him when he chose one abode. Only in Asia is the ordinary fowl found in a wild state, chiefly in India. Here is yet to be found the *Gallus ferrugineus*, or *G. bankiva*, which, from its resemblance in every way to the modern fowl and the freedom with which the two breed together, is accepted as the progenitor of nearly all our domesticated varieties. At one time it was thought to be the parent of all, and this was the view of Darwin; but later researches have led to a modification of this opinion; there is no wild breed of fowl to which the Brahma and Cochiti type of fowl can be traced. The Jungle-fowl of India, or *G. bankiva*, has plumage and colour not very dissimilar to the game fowl, and this type prevails largely in the great dependency. From the time of the ancients poultry have been bred and kept. Many records found in the writings of early days refer to the fighting qualities of the cock, and in some countries he was bred largely, if not chiefly, for this propensity. Theognis, Aristophanes, Aristotle, Diodorus, Æschylus, Plutarch, Plato, and Pliny all make reference in their writings to the fowl, which seems to have gradually spread over Europe, being, it is supposed, brought into Britain by the Romans, since whose time it has been an important member of our domesticated animals. The fighting qualities of game fowls have always been specially studied, and Cock-fighting (q.v.) was once a recognised sport in the United Kingdom, followed by all classes of society.

Poultry are valued for two purposes: (1) for their flesh, and (2) for the eggs produced by them. In those varieties which are specially bred for the table the flesh is abundant, fine in texture, excellent in flavour, and easily digested. It enters very largely into the food-supply of the country in an ever increasing ratio, and is strongly recommended to invalids or persons of weak digestion. Eggs (q.v.) are consumed to an even greater extent, and more generally than can ever be the case with poultry; for they are within the reach of all persons, and are

used for every form of cooking, as also largely for manufacturing purposes.

Although the breeds of poultry are not so numerous as are those of pigeons, the development of breeds since the era of poultry shows has been very great, and we have now some forty distinct varieties, several of which are again subdivided by different colours. There are about twenty varieties of ducks, seven of geese, and six of turkeys domesticated. Ducks are most prolific layers, and there is always a good demand for their eggs, especially by cooks and confectioners. The breeds of ducks valued mainly as layers are the Indian Runner and the Pekin. Those most esteemed for the table are the Aylesbury and Ronen, while the most popular dual purpose breeds are perhaps the Khaki Campbell and Buff Orpington. Fowls may be divided into four classes—viz. table breeds; laying or non-sitting breeds; general purpose breeds; and fancy or ornamental breeds.

Table Poultry.—Characterised by rapid growth, fine quality of flesh, and great breast development. **Dorkings.**—Old English breed, square bodied, white legs and feet, and five toes; four colours. **French.**—Seven varieties, all marked by large size, rich flesh, chiefly dark-legged. **Gamers.**—Have great breast muscles and fine flesh; not so large as the breeds already named; nearly half a score colours of game fowl may be found. **Indian Gamers.**—A very large breed, bred chiefly in Cornwall; beautiful in flesh quality, but darker than Dorkings or French, and heavier in bone; can be fed up to a great size. In addition to these may be named Aseels and Malays, which are good as table fowls.

Laying or Non-sitting Poultry.—In these the laying powers have been greatly developed (some varieties producing upwards of 200 eggs per annum), and the maternal instinct has been suspended by fineness. They are chiefly of the Mediterranean family, but not exclusively so. These Mediterranean varieties have large single combs, a lightish body, and include Aneoms (speckled), Andalusian blue, Leghorns or Italians (of which are ten colours), Minorcas (black), and Spanish (black with long white faces). **Hamburghs.**—Under this term are two families, the Yorkshire and Lancashire Pheasant Fowls (spangled and black), as also the Redcaps, and the Dutch (pencilled), all very beautiful, and the most prolific layers we have. **Houdans.**—Another French breed, with a crest, pale legs, and five toes. **Polish or Polled.**—Have a very large crest, are good layers, but are delicate; of these there are six colours. **Scotch Greys.**—A neck-poll-plumaged fowl, with pale legs, good flesh, and suitable for cold climates.

General Purpose Poultry.—Breeds which are not specially good in any one quality, but well balanced and good all round: chiefly of the Chinese type—e. heavy in leg and bone, large in size, and with high tails. **Brahmas.**—A Chinese fowl modified in Europe and America; two colours. **Orpingtons,** white, black, or buff, and **Rhode Island Reds,** a comparatively new breed of American origin, are valuable general purpose breeds. **Langshans.**—Like the Cochiti, of Chinese origin; an excellent layer of eggs with buff-tinted shells, and a capital table fowl; one variety, black in plumage. **Plymouth Rocks.**—A variety of American making, cuckoo in plumage, and excellent in economic qualities. **Vandykes.**—Also of American origin; equal as a layer and for the table; four colours. All these make excellent mothers, as do most of those in the table-poultry section, and are very handy.

Fancy or Ornamental Poultry.—These include the breeds which are either bred alone for their beauty or peculiarity of plumage, or by reason of imitative size are of no service for economic

purposes. They embrace the Game Bantams (six varieties), Bantams (thirteen varieties, but constantly being added to, many from China and Japan), Japanese Long-tailed, Silkies, Sultans, Frizzled, Naked Necks, Rumpless, &c.

That poultry can be made profitable is undoubted, although many attempts to establish poultry-farms as such have ended in failure. Considerable profit is often made by those who breed and exhibit pure-bred poultry, whilst the advantage of having fresh eggs and home-fed poultry is sufficient inducement to many who have the opportunities of keeping a few fowls, apart from the pleasure derived from them. Poultry can be kept under many conditions, and have been found to thrive in the most unlikely places, but all their wants must be artificially supplied. To maintain them in health they should have a house dry above and below, with 16 square feet of floor space for every half-dozen fowls of the medium-sized varieties, an outside shelter in which is placed a dust bath, this being the way in which their skin and feathers are cleansed, and an open run without. If they can be given full liberty it is all the better, for which reason movable houses placed out in fields or parks are the best; but often it is impossible to do this, and then not less than 6 square feet of ground should be allowed to each fowl if the run is laid in gravel or sand, or 100 square feet per bird if in grass, or it will all be eaten off and the ground left bare. Absolute cleanliness is essential for them in houses, nests, and runs, and the ground should be changed every two or three years, or it is liable to become foul from the richness of their manure. Fowls naturally eat grain, slugs, worms, &c., and, if the latter are not obtainable in the ground by them, some substitute must be provided. For laying birds it is found that soft food is very beneficial, and it should be given in the morning, with hard corn in the later part of the day. Sitting hens should be provided for apart from other stock, as they require to be in a quiet place. The time of incubation is twenty-one days. When the brood has made its appearance the hen and chickens should be placed out in a coop, and the latter fed every two hours for the first fortnight, every three hours for the next two weeks, and after that four times a day until they reach maturity. Artificial incubation and brooding are very largely adopted by poultry-breeders, and have been brought to a remarkable state of perfection, the machines now sold working with great regularity and precision (see INCUBATION). The advantage of incubators is that they can be used at any period of the year, and are not dependent upon the weather, as is the case with hens. There are now innumerable varieties of incubators on the market, mostly of British and American manufacture. This plan of working is largely employed in France and America. Poultry are polygamous, and from four to ten hens should be placed with each cock bird, according to breed and the season of the year.

Poultry-farming.—Many attempts have been made to establish poultry-farms, but they have often ended in failure, and it has come to be widely believed that poultry will not pay. The reasons for this failure have been twofold: first, that the amount of space necessary to keep the fowls in health when in large numbers, and the consequent increase in labour, were too heavy charges against the enterprise; and second, the placing of a large number of birds together, under conditions which were unhealthy, induced disease, and so ruined the scheme. The great mistake has been made in attempting poultry-farming as a separate industry, rather than as part of a larger enterprise. Where it can be grafted upon other work, an addition to the business of farming or fruit-growing, it can

be, and has been, made successful in several notable instances. In these there is no separate charge for land; the labour is not on account of it alone; a large portion of the food needed by the fowls is obtained by themselves from the ground, and such as is given is at the first cost; the produce can generally be sold with what other is going to market, and especially if dairying or fruit-growing be also entered into, those who purchase milk or butter or fruit being generally willing to buy the eggs and chickens; and, finally, the land is enriched by the manure of the fowls, whilst its employment for other purposes will prevent its becoming foul, the great danger when only poultry are kept on the land, for disease is speedily induced by foul ground. The force of events during recent years has compelled many British farmers to take up what were at one time regarded as minor pursuits, and branches of farming which in themselves are not sufficient to give a living—for which reason they were neglected for larger things—have received attention. Or, as it has been expressed, 'commercial poultry will only pay as an accessory to something else, whether it be a farm or a household—to eat scraps which would otherwise be wasted . . . and to give to the land, in the shape of manure, properties which cannot otherwise be obtained except by a heavy outlay.' When we look to France, where poultry are bred to such an enormous extent, we find that poultry-farms as such have no existence, but that fowls are kept by every farmer and cottager. The same remarks apply to Italy, Denmark, and Ireland, from all of which countries England receives large supplies of eggs and poultry. In the wine districts of France fowls are permitted to wander amongst the vines all the year round, except just when the fruit is forming, and they do a most servicable work in cleaning and manuring the ground. The poultry houses are placed in the vineyards, and in many cases are made sufficiently narrow to pass between the rows of plants.

In France, in the Surrey and Sussex districts of England, and also at Aylesbury, where so many ducks are fattened every year, systems of fattening are extensively carried on, but as a rule, in France especially, those who rear the birds do not fatten. Fattening is a business by itself, birds being purchased from the breeders when about eight weeks old. They are put into pens and fattened for a period varying from three to ten weeks, either by hand or with machines. Some of the latter are very elaborate, but as a rule they are simple. The head of the fowl is held in the left hand, and a brass nozzle, attached to a piece of india-rubber tubing, and connected with a cylinder, is inserted into the mouth of the bird. In this cylinder is a supply of liquid food, made of buckwheat or some other meal, milk, and a little fat, and it is so arranged that when a pedal is pressed by the foot a portion of the food, varying according to the stage of fattening—for it is increased in quantity each day until the process is completed—is injected through the tube and nozzle into the bird's crop. By this means the fattening is carefully and skilfully conducted, and there can be no doubt of the result, as every one who has tasted a well-fattened French fowl will be able to testify. In the La Bresse, Le Mans, and La Sarthe districts of France the number of fowls fattened every year is enormous, and the best specimens realise very high prices. The flesh is beautifully tender and white, and much more abundant than would be possible on an unfattened fowl. In Surrey and Sussex the method adopted is somewhat different, in that the birds are either fed by hand or with heavy crank cramping machines, powerful enough to force semi-liquid food into the crop of the fowl.

Here the process does not last more than three weeks. When the birds are killed they are immediately plucked, and placed, before they become quite cold, on shaping boards, so made as to give them the best appearance. In Ireland there is very little fattening carried on, and consequently the poultry from that country are poor and sell at about the lowest price on the English market.

Where poultry are kept in large numbers the best method of housing is by means of movable or portable dwellings, for these can be transferred about from place to place, giving the fowls fresh ground and distributing their manure, which is very valuable indeed, over the land. Under no circumstances should more than fifty be kept in one flock; and it will be found in practice that they will not wander far from their home, or mix with each other, even if the houses be placed in adjoining fields. The ordinary methods of management are applicable here. There can be no question that the increase in the size of farms, which has taken place within the last half of the 19th century, has done much to discourage poultry-keeping, and the opposite tendency ought to have a reactive effect (see PEASANT PROPRIETORS). Much might be done in the way of encouraging poultry-keeping by cottagers, who could maintain them with the minimum of cost and the maximum of results. A very important factor in successful poultry-keeping is the selection of right breeds, and it is essential that the produce should be marketed as speedily as possible. An egg two days old is worth twice as much as when two weeks laid, a fact which should always be borne in mind, but is too often forgotten. In the great cities and densely populated districts there is a constant demand for fresh eggs, and at high prices. To secure the best returns all eggs and poultry should be sent to market clean, well packed, and in the best possible condition. The supply of the commoner varieties of poultry produce is very large, and the prices obtained are consequently small, but there is no limit to the demand for high-class qualities at remunerative figures.

See *Wright's Book of Poultry* (ed. by Lewer); *The Encyclopedia of Poultry* (ed. by J. T. Brown); also numerous popular works. See also articles, DUCK, GOOSE, GUINEA FOWL, TURKEY, EGG, FOOD, INCUBATION, &c.

Pounce, powdered rosin, or some gum-resin such as mastic, sandarach, or copal, and also the powder of cuttle-fish bones, formerly used for sprinkling over freshly written writing to prevent blotting; fine sand was often substituted for pounce.

Pound (Old Eng. *pund*, Ger. *pfund*, Lat. *poundus*, 'weight'), long the unit of weight in the western and central states of Europe, differing, however, in value in all of them. The symbol 'lb' for it is equally general, and is derived from the Latin word *libra*. The old English pound, which is said to have been the standard of weight from the time of William the Conqueror till that of Henry VII., was derived from the weight of 7680 grains of wheat, all taken from the middle of the ear, and well dried. For the difference between the present avoirdupois and troy pound, see AVOIRDUPOIS, WEIGHTS AND MEASURES. In the British Pharmacopœia of 1864 the troy ounce was given up, and the pound avoirdupois and the ounce avoirdupois were adopted. See also LIVRE, MARK.

The pound weight of silver, a common money standard among the ancient Romans, was introduced by them into the countries they conquered, and thus the term 'pound' became a designation of a certain amount of coined money. Thus, nowadays, the English pound is considered as something (a coin or otherwise) equivalent to 20

shillings, but originally it denoted the pound of silver which was coined into 20 shillings. From Edward II.'s time the coins were more and more diminished in size, that monarch coining 25 shillings from a pound of silver; while from the same weight of bullion his various successors coined 30, 45, 48, 96, 144, 288, in the time of Elizabeth 60, and under George I. 66 shillings to the pound of silver, and this rate still continues, the term 'pound' being severed from its original meaning, and signifying 20 shillings of the present coinage. The sovereign of gold was first struck under Henry VII.; its value rose to as much as 30 shillings; under Charles II. it was fixed at 21 shillings, and the sovereign was superseded by the Guinea (q.v.) till 1817 (see MONEY, MINT). The pound Scots, originally of the same value as the English one, sank in value after 1355 till in 1600 it was but one-twelfth of the value of the English pound, and was accordingly worth 1s. 8d.; it was divided into twenty shillings, each worth an English penny. The Treaty of Union provided that the money thereafter issued should be of the same standard and fineness throughout the United Kingdom.

Pound, in English law, means an enclosure, of which there was generally one in every parish or manor, in which stray cattle were put and detained until the damage done by them was paid for. Whenever a stranger's or neighbour's cattle trespass on another's lands the latter can seize them, and take them to the pound, or impound them, as it is called, *damage feasant*, and can keep them there till the expenses are repaid. There was a distinction between pound overt, or common pound, and pound covert, or close pound; in the former case the owner of the beasts could go and feed and water his cattle while impounded, and it was his duty to do so; but not in the latter case. Now it is compulsory for the impounder in all cases to supply the cattle with food, otherwise he incurs a penalty; and if impounded cattle are not sufficiently fed a stranger who feeds them may not only trespass on lands to do so, but can recover the costs from the owner of the beasts. Goods distrained, if liable to be stolen or damaged, should be deposited in pound covert. At Madresfield, near Malvern, a public pound was repaired so recently as 1888; but practically they are quite obsolete, since the law now permits a person distraining for rent to secure the distress on the premises (see DISTRESS). In the United States estrays are generally liable to be sold for the benefit of the poor of the place where they are found, or for some other public use.

Pound, EZRA, American poet, was born at Hailey, Idaho, in 1885, but has lived in England since 1909. His published work includes *Personæ* (1909), *Exultations* (1909), and *Iskra* (1917). His best work reveals a striking originality of thought and expression, that is apt, however, to degenerate into technical eccentricity. The revolutionary becomes absorbed in problems of metre, and inspiration runs to seed.

Poundal, a name sometimes used for the absolute foot-pound-second unit of force, which will produce in one pound a velocity of one foot per second, after acting for one second.

Pounds, JOHN. See KAGGED SCHOOLS.

Poushkin. See PUSHKIN.

Poussin, NICOLAS, a painter of great celebrity, was born at Les Andelys in Normandy in June 1594, went at the age of eighteen to Paris, and studied under Ferdinand Elle, the Fleming, Lallemand, and others, but chiefly improved himself by drawing from casts, and drawings and prints after Raphael and Giulio Romano, in the collection of

M. Courtois, who accorded him access to them. After a long and hard struggle he attained the object of his desire—the means of visiting Rome. He was thirty years of age when he arrived there, and a considerable period elapsed after that before he obtained much employment. At length, however, he received several important commissions from the Cardinal Barberini, which he executed so successfully that he afterwards rapidly acquired fame and fortune. After an absence of sixteen years he returned to Paris with M. de Chanteloup, and was introduced by Cardinal Richelieu to Louis XIII., who appointed him his painter in ordinary, with apartments in the Tuileries and a small salary. But in 1643, annoyed by intrigues against him, he returned to Rome; and there, after producing a large quantity of admirable work, he died on 19th November 1665. His style is a combination of classical ideals and Renaissance tendencies; his colours have changed so as to interfere with the harmony of his pictures, whose noble designs may be admirably studied in the numerous engravings of them. The finest collection of his works is in the Louvre; but some of the best are in the National Gallery, at Dulwich, and in English private collections.—His nephew, Gaspar Dughet (1613–1675), assumed his uncle's name, and as GASPAR POUSSIN became famous as a landscapeist, his renderings of the Roman Campagna being especially noted. He worked also in tempera and fresco.

See works on Nicolas Poussin by St Germain, Bouchitté (1858), Poillon (2d ed. 1875), Emile Magne (1914), and Mrs Sutor (1923).

Pout. See **BIB.** The names Horned Pout and Bullpout are given in America to the silurid *Amblyurus*, also called Catfish (q.v.).

Poverty Bay. See GIBBORNE.

Powan (*Coregonus clupeoides*), or Freshwater Herring, a species of 'Whitefish' inhabiting Loch Lomond and Loch Eck. See **COREGONUS**, **GWYNAD**, **POLLAN**, **VENDAKE**.

Powell, **BADEN**, physicist and theologian, was born in London in 1796, was educated at Oriel College, Oxford, in 1821 became vicar of Plumstead, and in 1824 was made F.R.S. From 1827 till his death, 11th June 1860, he was Savilian professor of Geometry at Oxford. He published a history of natural philosophy (1834), treatises on the calculus (1830), optics (1833), and the undulatory theory of light (1841); but he is best known by his contribution to the *Essays and Reviews* (q.v.), and by other theological works, then regarded as dangerously 'liberal'—such as *Essays on the Plurality of Worlds* (1856), *Christianity without Judaism* (1857), *Natural and Divine Truth* (1857), and *The Order of Nature* (1859).—His son, **SIR ROBERT STEPHENSON SMYTH BADEN-POWELL**, **BL.** (1922), born 22d February 1857, was educated at Charterhouse. He joined the 13th Hussars in 1876, and served in India, Afghanistan, South Africa, Ashanti, and Matabeleland, and was promoted in 1897 to the command of the 5th Dragoon Guards. In the Transvaal war he held the town of Mafeking successfully against the Boers from 12th October 1899 to 18th May 1900; and in quite an exceptional degree was himself the inspiration and mainspring of the defence. Besides being ranked amongst national and popular heroes, he was created a lieutenant-general, and was inspector of cavalry in 1903–7, and retired in 1910. His forte is scouting, on which he has published several brilliant pamphlets, as well as on his campaigns, cavalry instruction, and pig-sticking. He founded the Boy Scouts (q.v.).

Powell, **JOHN WESLEY** (1834–1902), geologist, was born at Mount Morris in New York State, and

became major in the civil war. He was afterwards professor of Geology in Illinois; in 1868 explored the cañon of the Colorado; in 1879 he was made director of the new Bureau of Ethnology; and in 1881 he was appointed also director of the United States Geological Survey. His works include *Exploration of the Colorado River* (1875), *The Arid Region of the United States* (1879), and *Contributions to North American Ethnology*.

Powell, **MARY.** See **MILTON**.

Power is a legal term, to some extent identical in meaning with such terms as liberty, faculty, &c. A public officer is empowered to do certain acts which are not permitted to private persons. An individual, not under disability, has power to bind himself by contract, and to dispose of his property; if he chooses to settle his property he may effect the purposes of the settlement by conferring powers on himself and others; he may, for example, reserve to himself a power of revocation; he may give power to a person who takes a life interest to charge the inheritance with portions for daughters, &c. Powers of appointment are commonly used in English settlements to enable parents to appoint or distribute settled property among their children. Such powers must be exercised in good faith, and with the forms prescribed by the settler who confers them. A power of attorney is a deed whereby one person appoints another to do some act on his behalf or to represent him generally. **A**, for example, may make **B** his attorney, to manage his estate and receive the rents during **A**'s absence abroad. Forms of such powers are given in Davidson, Prideaux, and other books of precedents; the difficult legal questions which arise in regard to powers over settled property are discussed in the treatises of Sugden and Farwell.

Power. For the Mechanical Powers, see **MECHANICS**; and for various motive powers, see **AIR-ENGINE**, **DYNAMO-ELECTRIC MACHINES**, **INTERNAL-COMBUSTION ENGINES**, **STEAM**, **PNEUMATIC DESPATCH**, **FUEL**, &c.; see also **HORSE-POWER**, **TRANSMISSION OF POWER**. For the 'Great Powers' of the world, see **BALANCE OF POWER**.

Powers, **HIRAM**, American sculptor, was born a farmer's son at Woodstock, Vermont, July 29, 1805. While still a boy he went to Cincinnati, Ohio, where he became an apprentice to a clock-maker, and about the same time formed the acquaintance of a German sculptor, who taught him to model in clay. Subsequently he was employed for seven years making wax figures and fitting them with machinery for the Cincinnati museum. In 1835 he went to Washington, where he executed the busts of several distinguished persons. Two years later he was enabled to proceed to Italy to study his art, and he resided in Florence till his death on 27th June 1873. There he produced his statue of 'Eve,' which excited the admiration of Thorwaldsen, and in 1843 the still more popular 'Greek Slave,' of which six copies in marble, with cast copies innumerable, were produced. Of his 'Fisher Boy' (1846) three copies were ordered. Among his other works the chief were 'Proserpine,' 'Il Penseroso,' 'California,' 'America,' and busts of Washington for the state of Louisiana, of Calhoun for South Carolina, and Daniel Webster for Boston, as well as those of J. Q. Adams, Andrew Jackson, Marshall, Van Buren, and other distinguished Americans.

Poynings' Act. See **IRELAND**.

Poynter, **SIR EDWARD JOHN**, President of the Royal Academy, was born in Paris, 20th March

1836, the son of Ambrose Poynter, architect, and great-grandson of Thomas Banks, sculptor, R.A. He was educated at Westminster and Ipswich grammar-school. The winter of 1853-54 was spent in Rome, where he made the acquaintance of Frederick Leighton, then a young man painting his picture of 'Cimabue,' who allowed Poynter to work in his studio, drawing from the models and drapery from which he was studying for his picture. In 1856 he went to study in Paris, and in 1860 settled finally in London. In 1868 he was made an A.R.A., in 1876 an R.A. In 1871 he was appointed Slade professor, and in 1876 Director for Art and Principal of the training-schools at South Kensington—appointments which in 1881 he resigned as interfering too seriously with his time for painting. From 1896, when he was knighted, to 1918 he was P.R.A., and in 1902 he was made a baronet. He died 26th July 1919. Poynter's output was a large one, including water-colours, portraits, designs for the coinage (1894), and cartoons for mosaics in the Houses of Parliament (1869-70), and for decorations in St Paul's (1882-84). His best known pictures are 'Israel in Egypt' (1866), 'The Catacomb' (1868), 'Visit to Asculapins' (1880), and the series of canvases painted (1872-79) for the Earl of Wharfedale and now at Wortley Hall. While he was Director at South Kensington, he published a volume of Lectures on Art. Poynter was the last representative of the 19th-century classic movement in painting, which reached its climax with Leighton. This classicism is manifest not only in the choice of Greek and Roman subjects, but also in the monumental and sculptural feeling for design. Though it is a style of painting that is always dignified, it is apt to lose its freshness and become conventional.

Poznań. See POSEN.

Pozzo di Borgo, CARLO ANDREA, COUNT, was born near Ajaccio in Corsica, 8th March 1764, and was educated at the university of Pisa. An advocate in Ajaccio, in 1790 he joined Paoli (q.v.), becoming thenceforth the enemy instead of the friend of Bonaparte. Paoli made him president of the Corsican council of state in 1794, and subsequently secretary of state; but in 1796 he was obliged to seek safety from the Bonapartes in London. Two years later he went to Vienna and effected an alliance of Austria and Russia against France. In 1803 he entered the Russian service as a councillor of state, and was employed in many important diplomatic missions. After the battle of Jena he laboured to unite Napoleon's enemies against him, and again in 1809 and 1812. He also effected the seduction of Bernadotte, crown-prince of Sweden, from the Napoleonic cause; and after the allies had driven Napoleon across the Rhine, Pozzo di Borgo drew up the famous declaration, 'that the allies made war not on France, but on Napoleon.' It was he who urged the allies to march on Paris. He represented Russia at Paris and the Congress of Vienna, at the Congress of Verona, and in London, but retired from public life in 1839, and settled in Paris, where he died, 15th February 1842. See *Notice Biographique* by Vuhner (Paris, 1842).

Pozzuoli, a city of Southern Italy, on the Bay of Naples, 6 miles W. of Naples, with which it is connected by railway. Its cathedral is built into the Temple of Augustus. The market-hall, generally called the Temple of Serapis or Serapion, had a rectangular colonnade of thirty-six pillars, surrounding a round temple with sixteen pillars. Some have alleged that the outer enclosure surrounded a market-place. Some of the pillars still standing are much eaten into by the lithodromus mollusc

(see BORING ANIMALS), showing that this volcanic coast was for a considerable time submerged to a depth of 13 feet beneath the sea, and subsequently upheaved again. Part of the ruins are still under the sea-level. There are the remains of two amphitheatres, in one of which Nero fought as a gladiator, and which could seat 30,000 spectators; in it wild beasts refused to injure St Januarius and his companions, thrown to them by persecutors. There are also remains of a circus, tombs, villas, &c., and of the ancient harbour of Puteoli. Behind the town is the Solfatara (anciently called *Forum Vulcani*, as being the entrance to Vulcan's forge), a half-extinct volcano, from which issue currents of hot sulphureous gases, inhaled by sufferers with chest complaints, and springs of saline water, used as a remedy for cutaneous diseases. In the neighbourhood are Averum (q.v.); the royal hunting-lodge Astroni; Lake Lucrims, celebrated for its oysters; the ruins of Baia (q.v.) and Cumæ (q.v.); and the Grotta del Cane (q.v.). Of a very different interest are the military engineering works, the Stabilimento Armstrong, a little to the west of Pozzuoli; this is a branch of the famous Armstrong works at Elswick, near Newcastle, established here (1888-90) with the support of the Italian government. Pop. 24,000. The ancient *Puteoli*, probably founded by a colony of Samians in 520 B.C. under the name of Dicearchia, seems to have come under Roman domination in 334 B.C., and was made a Roman colony in 194 B.C. Towards the end of the republican period it became, like Ostia, mainly a port of Rome, and during the empire it was the first emporium of commerce in Italy. St Paul landed here in 61 A.D. See Dubois, *Ponzoles antique*, Paris, 1907. Puteoli was destroyed by Alaric, Genseric, and Totila, and, though rebuilt by the Byzantine Greeks, it was sacked by the Saracens (10th century) and the Turks (1550), and ruined by earthquakes (1198 and 1538).—For the volcanic earth found here and elsewhere, and called *Pozzuolana* or *Puzzolana*, see CEMENTS.

Practice, in Arithmetic, is the name given to a method, or rather a system of expedients, for shortening or avoiding the operation of compound multiplication. The nature of the expedients will be best understood by an example: Suppose that the price of 64,875 articles at £2. 17s. 6d. is required. It is obvious that the price, at £1, would be £64,875; therefore, at £2, it is £129,750; at 10s. it is the half of that at £1, viz. £32,437. 10s.; at 5s., the half of this last sum, or £16,218. 15s.; and at 2s. 6d., the half of this, or £8109. 7s. 6d. The sum of these partial prices gives the whole price.

Prado, a famous street and picture gallery in Madrid (q.v.).

Praed. WINTHROP MACKWORTH (1802-39), was born 26th July 1802, at 35 John Street, Bedford Row, London. His name Winthrop came from American connections; Mackworth had been the surname of his father, who was a sergeant-at-law. After some training at a private school he went to Eton. Here he was more famous for literature than athletics, and was one of the most brilliant contributors to the well known *Etonian*. From Eton he passed in 1821 to Trinity College, Cambridge, distinguishing himself rapidly in Greek and Latin verse, and cultivating the lighter letters with increased success in Charles Knight's *Quarterly Magazine*, where he had for co-authors De Quincey, Macaulay, Montrie, H. N. Coleridge, and others. In 1825, having won many college honours, he became tutor to the son of the Marquis of Ailesbury, intending to qualify for the bar, to which four years later he was called. In November 1830

he entered parliament for St Germain's. He subsequently became member for Great Yarmouth, and later for Aylesbury, which he represented at his death on 15th July 1839. From 1834 to 1835 he was secretary to the Board of Control.

But for his short life Præd might possibly have been successful as an orator and politician. As it is, he derives his existing reputation from the finished and facile verses which he wrote almost from his childhood. He is the Coryphæus of the little band of rhymers whom criticism, according to its taste and fancy, either dignifies or stigmatises as writers of *vers de société*—a term in its stricter sense applied to those pieces which treat only of the sayings and doings of the fashionable world. The majority of Præd's efforts belong exclusively to this class; and in this line his note is so individual, his rhythm so brilliant, and his wit so bright, that it has hitherto been found more easy to imitate than to excel him. A typical example of this side of his talent is the poem called *A Letter of Advice*. But he is also admirable in a kind of metrical genre-painting.—e.g. *The Vicar*, which, in the opinion of many, reaches a higher poetical elevation; while in *The Red Fisherman, Sir Nicholas*, and one or two other pieces, he not unskillfully emulates the manner of Macaulay and Hood. His characteristics as a verse-writer are point, elegance, and vivacity; it is his defect that these excellent gifts are but seldom relieved by any graver note. His collected verses, popular in America long before they were gathered together in England, appeared in 1864 in two volumes, with a memoir by the Rev. Derwent Coleridge; in 1887 followed his prose essays; and in 1888 his nephew, Sir George Young, edited his political poems. The best modern study of Præd is to be found in Saintsbury's *Essays in English Literature* (1890).

Præfect, a common name applicable to various Roman functionaries. The most important was the *Præfectus urbi*, or warden of the city, whose office existed at an early period of Roman history, but was revived under Augustus, with new and greatly altered and extended authority, including the whole powers necessary for the maintenance of peace and order in the city, and an extensive jurisdiction civil and criminal. The *Præfectus prætorio* was the commander of the troops that guarded the emperor's person.

Præfloration. See *ÆSTIVATION*.

Præfoliation. See *VERNATION*.

Præmonstratensians. See *PREMONSTRATIENSIS*.

Præmunire, the name given, in English law, to a species of offence of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire* or *præmonere facias*) of a writ originally introduced for the purpose of repressing papal encroachments on the power of the crown. The attacks of the popes on the rights of private patrons, by bestowing bishoprics, abbacies, &c., on favourites, often aliens, and the pope's insisting on deciding in his curia cases that ought to have been tried in the king's courts, were especially unpopular in England, and were the immediate cause of various statutes of præmunire. Severe penalties were imposed on those who gave or sought to enforce obedience to the papal encroachments. The Statute of Provisors (1350; see ENGLAND, CHURCH OF) was an early act of this sort; the first act called Præmunire was passed in 1353; but the name of Præmunire is specially used of an act of 1393, in which Richard II. re-enacted and strengthened the statute of Edward III. Under Elizabeth it was made a breach of the Statute of

Præmunire to refuse the oath of supremacy. By later statutes a number of offences of a miscellaneous description were rendered liable to the penalties of a præmunire, as (by 6 Anne, chap. 7) the asserting that any person, other than according to the Acts of Settlement and Union, has any right to the throne of these kingdoms. The knowingly and wilfully solemnising, assisting, or being present at any marriage forbidden by the Royal Marriage Act is declared by Geo. III. chap. 11 to infer a præmunire.

Præneste. See *PALESTRINA*.

Prætor was, among the ancient Romans, the title given to the consuls as leaders of the armies of the state; but it was specially employed to designate a magistrate whose powers were scarcely inferior to those of a consul. The prætorship, in this specific sense of the term, was first instituted in 366 B.C., as a compensation to the patricians for being obliged to share with the plebeians the honours of consulship. It was virtually a third consulship; the prætor was entitled *collega consulis*; he was elected by the same auspices and at the same comitia. For nearly thirty years patricians alone were eligible for the office; but in 337 B.C. the plebeians made good their right to it also. The prætor's functions were chiefly judicial. Though he sometimes commanded armies, and, in the absence of the consuls, exercised consular authority within the city, yet his principal business was the administration of justice both in matters civil and criminal; and to the edicts of successive prætors the Roman law owes much of its development and improvement. Originally there was only one prætor; but as the city and state increased, and their relations with other nations became more complicated, others were added. In 246 B.C. a second prætor was appointed, to settle disputes that might arise between Romans and foreigners temporarily resident at Rome, for trading or other purposes, hence called *prætor peregrinus* ('foreign prætor'), to distinguish him from the original *prætor urbanus* ('city prætor'). In 227 two new prætors were appointed, to administer affairs in Sicily and Sardinia; and in 197 two more for the Spanish provinces, or six in all. Sulla increased the number to eight, and Julius Cæsar to sixteen. Augustus reduced the number to twelve; but at a later period we read of eighteen, if not more. The city prætorship was reckoned the highest; and after a person had filled this office he sometimes received the administration of a province with the title of *proprætor* or *proconsul*.

Prætorian Guard (Lat. *Prætoria Cohortes* and *Prætoriani*), a body of soldiers organised for the purpose of protecting the person and maintaining the power of the emperors. We read of a *prætoria cohors*, or select guard of the most valiant soldiers, attached to the person of Scipio Africanus, but it is to Augustus that the institution of them as a separate force was owing. He formed nine or ten cohorts, each consisting of a thousand men (horse and foot), but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased their number to sixteen. The Prætorians served at first for twelve, and afterwards for sixteen years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dig-

nity without their assistance were accustomed on their accession to purchase their favour by liberal donations. The Praetorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and careless how they got them. After the death of Pertinax (193 A.D.) they actually sold 'the purple' for a sum of money to Didius Julianus; but in the same year their peculiar organisation was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes Constantine (312) dispersed them among his regular legions.

Pragmatic Sanction (sometimes *Pragmatic Rescript*), a solemn ordinance or decree of the head of a kingdom relating either to church or state affairs. The term originated in the Byzantine empire, and signified a public and solemn decree by a prince (*pragmatikos*, 'business-like,' later, 'versed in affairs,' 'official'), as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. This name is given to several important treaties, of which the principal are (1) that of Charles VII. of France, issued at Bourges in 1437, in which the rights of the Gallican Church (q.v.) were asserted; (2) the instrument which settled the empire of Germany in the House of Austria (1439); (3) the ordinance by which Charles VI., German emperor, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa; (4) the settlement of the succession of the kingdom of Naples, which was ceded by Charles III. of Spain, in 1759, to his third son and his descendants.

Pragmatism. William James tells us in his *Pragmatism* (p. 46) that this term 'was first introduced into philosophy by Mr Charles Peirce in 1878. In an article entitled "How to Make our Ideas Clear" . . . Mr Peirce, after pointing out that our beliefs are really rules for action, said that, to develop a thought's meaning, we need only determine what conduct it is fitted to produce.' There is no thought-distinction so fine 'as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve—what sensations we are to expect from it, and what reactions we must prepare.' 'This is the principle of Peirce, the principle of pragmatism.' But the principle attracted no notice until James himself, in 1898, brought it forward again in an address entitled 'Philosophical Conceptions and Practical Results,' and this date may therefore be taken as the beginning of the pragmatist movement. Between this date and the publication in 1907 of James's own book *Pragmatism*, papers and books by Dewey, Schiller, and others had been published in which pragmatist views were developed and illustrated, and James was always anxious to give these writers full credit for their contributions to the common cause. But they themselves recognise James as the source of their inspiration, and in any case there can be no question that James is the outstanding representative and exponent of pragmatism to the world at large. For this pre-eminence there are several reasons. He had already made a great name for himself by his *Principles of Psychology* (1890); he had a marvellous gift for vivid and telling exposition; but above all he exemplified so well in his own philosophical discussions the spirit of pragmatism itself. He is always trying to drive straight at the real or important issues, is impatient of merely verbal dis-

putes and the minor points of controversy, ready, on the other hand, to accommodate himself and his formulas as much as he can to his opponent's point of view. Hence it is his exposition of pragmatism that must in the main be taken as the standard one.

Pragmatism is primarily a *method*. It consists in trying to interpret every scientific or philosophical notion by tracing its 'practical consequences.' 'What difference would it practically make to any one if this notion rather than that notion were true? . . . Whenever a dispute is serious, we ought to be able to show some practical difference that must follow from one side or the other's being right.' James elsewhere explains that by 'practical' he means 'particular' or 'concrete' and not merely 'utilitarian'; and this is important, because much controversy has turned upon this very point of the wider or narrower meaning of the term practical in the definition of pragmatism. In the narrower sense of the term no one would expect, e.g., to make any practical use of the difference between the physics of Einstein and of Newton, but in the wider sense of the term the difference has practical consequences, if it sets men of science upon making astronomical observations, and still more if these observations reveal facts which agree with the one theory and not with the other. Again, when James speaks of bringing out the 'practical cash-value' of a notion, he immediately explains his meaning by saying you must 'set it at work within the stream of your experience.' The pragmatic test of a theological notion would be to ask what significance it has for religious experience, of a scientific theory to ask how far it compels men of science to take account of it, to undertake new experiments and investigations. So far as pragmatism is simply a method, it of course does not guarantee any particular results. Just as historians may use the same historical method and yet arrive at different conclusions, so philosophers may use the same pragmatic method without agreeing in their metaphysical conclusions. The method as a method, at any rate, must not be saddled with the metaphysics to which any one thinker is led by using it. Hence James is careful to explain (*Meaning of Truth*, Preface and p. 220) that the metaphysical views of himself and his fellow pragmatists Dewey and Schiller—his own Radical Empiricism, for instance—go beyond the common ground of their pragmatism proper.

On the other hand, the pragmatic method is taken to involve a common *doctrine as to the nature of truth*. If every idea is to be construed in the light of its consequences, these consequences will also determine whether it is true or false. Suppose that I have the idea that the right-hand branch of a road leads to a certain village, the idea will be true if by taking that branch I actually arrive there. As a well-known formula says, an idea is true in so far as it 'works.' 'True ideas are those that we can assimilate, validate, corroborate and verify. False ideas are those that we cannot' (*Pragmatism*, p. 201). There is an obvious objection to our example. Why, it may be urged, do you say that the idea *will be* true? Surely if it is true at all it is true already, whether you continue your walk or not. Now, of course, it would be true already in the mind of a native of the district; but if I am only putting it forward as a tentative suggestion, it will not be a truth in my mind until I have actually verified it by continuing my walk or looking at a map or inquiring from some one who knows already. But it is precisely of truth *experienced as such* that the pragmatist is talking. With a truth that is not experienced by anybody, that simply 'obtains' and is a sort of 'spiritual double' of the *facts*, he will have nothing to do.

To assume a truth of this sort, 'a stagnant property inherent in the idea,' or 'an inert static relation' between the idea and its object, is anathema to the pragmatist. It is the essence of what he calls 'intellectualism,' and this vice of thought he denounces at every opportunity. Unfortunately he does not always exercise sufficient care in verifying the actual presence of the vice, and by his rather indiscriminate denunciations becomes himself responsible for a good deal of misunderstanding. It is almost obvious, for instance, that between pragmatism broadly interpreted and what is called the 'coherence' theory of truth there can be no serious quarrel. Yet nobody is more freely denounced by the pragmatists than Bradley: in their dislike of the metaphysics to which his logic led him they seem to lose sight of the kinship between his logic and their own. Their real enemy is rather to be found in the kind of logic which asserts that 'there is no problem at all in truth and falsehood; some propositions are true and some false, just as some roses are red and some white' (B. Russell).

When we set an idea to work in order to ascertain its truth, and when we find by trial that it succeeds or fails, we evidently presuppose some sort of reality or material whose acceptance of, or resistance to, the idea decides the success or failure of its working. The idea has to measure itself against the relevant facts of experience which have already established themselves or are assumed without question. The detective who is trying to work out a theory of a crime must make his theory square with the admitted facts of the case and the acknowledged results of medical science. The pragmatist, as James points out, can quite well speak of truth as consisting of the agreement of the idea with the facts or with reality, provided we understand the agreement in such a sense. 'Reality' is indeed an essential presupposition of the pragmatist's doctrine. 'For him, as for his critic, there can be no truth if there is nothing to be true about. . . . This is why as a pragmatist I have so carefully posted "reality" *ab initio*, and why, throughout my whole discussion, I remain an epistemological realist' (*Meaning of Truth*, p. 195).

Such, in outline, are the main positions of pragmatism as taught by James. Schiller's version, which he prefers to call humanism, presents two chief features of difference. He emphasises more than James does the psychological side of the quest for truth, the motives from which it springs and the interests which it seeks to satisfy—in short, the fact that our thinking is working throughout within the limits and under the conditions of human experience. Secondly, he is inclined to reduce to a bare minimum the 'reality' or material which we have seen to be a presupposition of the doctrine; and of course there is a sense in which experienced reality, like experienced truth, undergoes expansion and modification; in fact the expansion and modification of the latter obviously involve a corresponding difference in the former. The explorer who verifies his ideas about the unknown source of a river extends at the same time the bounds of experienced fact. But it must be admitted that such a mode of statement is open to misconstruction. The special features of Dewey's version are more difficult to state clearly and shortly; his writings are far less pointed and effective than James's, though his teaching has been influential. His interest is primarily a logical one in exhibiting and analysing the instrumental function of thought. Instrumentalism is the name which he uses to designate his version of the pragmatic doctrine. He draws a sharp distinction between thinking and the rest of our experience, and regards thinking as the instrument by which

the problems or discords that emerge in experience are resolved.

It would take up too much space to mention more than small selection from the writings of the leading pragmatists and the controversial literature. The following list may be taken as sufficiently representative: James, *Pragmatism and Meaning of Truth*; Schiller, *Studies*

all the rest of the anti-pragmatic literature.' Bradley's criticism may be seen in his *Essays on Truth and Reality* (chapters iv. and v. with the Appendices to the latter), and B. Russell's *Philosophical Essays* contains two on pragmatism. A French book, *Le Pragmatisme Américain et Anglais*, by E. Leroux (1923), is said to be discriminating and fair and to provide a good bibliography.

Prague (Ger. *Prag*, Czech *Praha*), the capital of Bohemia, and now of the Czechoslovak republic, is situated at the base and on the slope of the hills which skirt both sides of the islet of Moldau, 217 miles by rail NNW. of Vienna and 118 SSE. of Dresden. It offers a highly picturesque appearance from the beauty of its site, and the numerous lofty towers (more than seventy in number) which rise above the many noble palaces, public buildings, and bridges of the city. The fortifications have been gradually demolished since 1866. The Burg, on the Hradschin (240 feet), the ancient residence of the Dukes of Bohemia, dates mainly now from the 16th and 17th centuries, and has 440 rooms. The neighbouring cathedral of St Vitus (1344) is still unfinished, though building was resumed in 1867. Here are the splendid royal mansion (1589) and the shrine (1736) of St John of Nepomuk (q.v.), containing 1½ ton of silver. Of other Catholic churches the chief are the domed Jesuit church of St Nicolas, with its lavish decorations, and the Týn church (1407), the old Hussite church, with the grave of Těcho Bralé, and its marble statues of the Slavonic martyrs, Cyril and Methodius. Of the bridges the most striking is the Karlsbrücke (1357-1503), 543 yards long, with gate-towers at either end, and statues of John of Nepomuk and other saints. It was greatly damaged by flood in September 1890, but has been restored. Other noteworthy objects are the town-hall (1381-1884), the Pulverturm (1475), the Czech Theatre, the old Jewish graveyard, the vast Czerui Palace, the Picture-gallery, and the Premonstratensian monastery of Strahov. Prague has, besides, numerous public gardens and walks in the suburbs, with several parks open to the public in its neighbourhood. The suburb of Károlinthal, which is traversed by a great railway viaduct, and is of modern growth, has some fine buildings, numerous gardens, barracks, and manufacturing establishments; and somewhat farther north is the great botanical garden, with the neighbouring public walks on the Moldau. The university, founded in 1348, had 10,000 students at the beginning of the 15th century; but subsequently it had a long period of decay. It was divided in 1882 into two universities, German and Czech. Prague has also polytechnics (German and Czech), academies of art and science (German and Czech), a great library, a fine observatory, museums, a botanical garden, &c. Some Russian institutions have been established in the town, including the small Ukraine university (1921). The manufactures include machinery, chemicals, leather, cotton, linen, gloves, beer, spirits, &c. Prague is the great centre of the commerce of Bohemia, and the seat of an important transit trade. Pop. (1880) 293,822; (1921) 676,657.

History.—Prague was founded, according to popular tradition, in 722 by the Duchess Libussa, but really grew out of the settlements forming around the two castles of Hradschin and Wyse-

chrad to which a German settlement was added in the 12th century. In the 14th century its munificently endowed university brought foreigners to it from every part; but in 1424 Prague was conquered and almost destroyed by the Hussites, who had made a successful stand against the Emperor Sigismund's army. In the Thirty Years' War it suffered severely, and in 1629 the battle was fought at the White Mountain, near the city, in which the Elector-Palatine, Frederick V. (q.v.), was completely defeated, and compelled to renounce his assumed crown. Swedes and Imperialists successively gained possession of the town during the war; and a century later it again fell into the hands of different victors, having been compelled in 1744 to capitulate to Frederick the Great, who here on 6th May 1757 defeated 60,000 Austrians under Prince Charles of Lorraine. Until the down fall of Napoleon the city continued to suffer more or less directly from the troubles in which the House of Austria was involved. Since then, however, it has made rapid strides, and enjoyed prosperity and quiet, except in 1848, when the meeting of the Slavonic Congress within its walls called forth such strongly marked democratic demonstrations on the part of the supporters of Pan Slavism that the Austrian government dissolved the conclave, and restored quiet by the summary method of causing the old and new town to be bombarded for two days. In 1866 Prague was occupied bloodlessly by the Prussians, who here on 23d August concluded a treaty with Austria. See Count Lutzw's *Story of Prague* (1903).

Praha. See PRAGUE.

Praia Grande. See RIO DE JANEIRO.

Prairie (Fr. 'meadow'), the name given by the early French explorers of the northern portion of the Mississippi Valley, to the vast fertile and treeless plains which extend from Western Ohio and Southern Michigan across the states of Indiana, Illinois, Missouri, Arkansas, Iowa, Kansas, Nebraska, and North and South Dakota, including the southern portions of Wisconsin and Minnesota. The prairie region also extends northward into Canadian territory. These great plains or *savannas* are sometimes flat, but oftener rolling like the long swells of the ocean, and rise in gradual elevation from 300 to 1500 feet above the sea. See AMERICA.

Prairie Dog. a genus (*Cynomys*) of small rodents closely allied to the European Marmot (q.v.); these animals have received their vernacular name on account of the barking sound

Prairie Dog (*Cynomys ludovicianus*).

which they utter. They live associated together in colonies consisting of numerous burrows excavated by the animals themselves; their range is entirely

restricted to the parks and plains of the Rocky Mountain plateau region in North America, and there appear to be two distinct species, *C. ludovicianus* in the middle states, *C. columbianus* nearer the Rocky Mountains. They have been popularly supposed to share their habitations, and to live in friendly relations, with rattlesnakes and owls. As regards the rattlesnake, it is more than probable that its occurrence in the burrows of the rodent is to be explained by a desire to make a meal of its neighbours, while the owl may have a similar purpose in view; it is also possible in both cases that the burrows may be merely utilised as a temporary hiding-place. The Prairie Marmot is rather larger than a large rat, and is of a brownish-gray colour, the under surface grayish white.

Prairie Hen. See GROUSE.

Prākṛit (from *prākṛita*, 'natural,' 'common,' as opposed to *saṃskṛita*, 'polished,' 'refined') is the collective name in Hindu grammarians and writers on poetics of a number of literary dialects, representing stereotyped forms of vernaculars current in India for some centuries before and after the Christian era. The most important of these is Ardha-Māgadhī, the sacred language of the Jains, whose canon was redacted in it in the 5th century A.D. It represents a later form of the speech used by Mahāvīra, the founder of Jainism, and probably also by the Buddha, and it has affinities with the court dialect of Pāṭaliputra (Patna), the capital of the empire of Asoka. Of the more eastern dialect of Māgadhī little is preserved. The southern dialect, Māhārāṣṭrī, was employed in an important lyric literature from the 3d century A.D. and became established as the language of lyric portions of the drama. The prose of the drama is in Sauraseni, the dialect of Mathurā, the home of the drama. The non-canonical works of the Jains are written partly in dialects which have been styled Jain Sauraseni and Jain Māhārāṣṭrī. The Pāṭāli, perhaps a dialect of the Vindhya rather than of the north-west, was used for the *Bṛhatkathā* of Guṇādhya, a famous book of stories and fables. Based on a western Prākṛit, but with assimilation in grammar to the vernacular, there is the Apabhraṃśa, in several varieties, which was used as a literary medium by some later Jain writers. Pāli (q.v.) on the other hand, may be classed as an older Prākṛit.

The Prākṛits are not derived from Sanskrit; like it, they are refined versions of vernaculars, but they are derived from vernaculars at a considerably later stage of development and, save in the case of Sauraseni, of different geographical situation. Recent writers, accordingly, have used the terms Primary Prākṛits to denote the early Indo-Aryan vernaculars, one of which, in the form in which it was used by the Brahmins and other educated persons, gives birth to Sanskrit; Secondary Prākṛits, of which the dialects above mentioned are literary forms; and Tertiary Prākṛits, or Apabhraṃśas, the forerunners of modern vernaculars, but this terminology is not Indian.

See R. Pischel, *Grammatik der Prākṛit-Sprachen* (Strassburg, 1900); R. O. Franke, *Pāli und Sanskrit* (Strassburg, 1902); H. Jacobi, *Bharatīya Kāka von Dharmadatta* (Munich, 1918); *Sanskritānandacūṭam* (Munich, 1921); *Linguistic Survey of India* (in progress).

Prase, a ravish green variety of Quartz (q.v.).

Praseodymium. See DIDYMIUM.

Prater. See VIENNA.

Pratique is, strictly, a limited quarantine. A ship is said to have performed pratique when her captain has convinced the authorities of a port that his ship is free from contagious disease; and he is thereupon permitted to open trade and communication with the shore.

Prato (often called *Prato in Toscana*), a walled town of Italy, by rail 10½ miles SE. of Pistoia and 11 NW. of Florence. It has a citadel and a cathedral, begun in the 12th century, in the Tuscan Romanesque style, and continued till the 15th century, with frescoes by Filippo Lippi, and a famous external pulpit by Donatello and Michelozzo (though the sec has been united with that of Pistoia since 1653). There are several other interesting churches, including the early Renaissance *Madonna delle Carceri*. There are manufactures of straw-plait, cloth, woollens, and paper and brass works. Pop. 60,000.

Prawn, a name applied to many of the higher crustaceans (tribe Caridea), in such families as Pandalidae, Hippolytidae, and Palaemonidae. They are nearly allied to shrimps (Crangonidae). The majority, e.g. *Palaemon serratus*, live in shoals in shallow coastal waters; a few go up rivers and into lakes, e.g. *Palaemonetes* in Europe and America; and some brilliantly phosphorescent forms occur at great depths in the ocean. Prawns are lightly built, very active, voracious animals, often semitransparent, usually brightly coloured. Many, e.g. the Aesop prawn (*Hippolyte varians*) show a remarkable power of changing their colour to suit their surroundings, literally putting on a garment of invisibility. Colour-cells on the surface expand and contract in obedience to stimuli which pass from the eyes to the nervous system. The adults sometimes have a fixed colour-pattern which has also become adjusted to their habitual environment. Many prawns are very palatable; they may be caught in putting nets or in osier baskets like those used in trapping lobsters. Most prawns are a few inches long, but many freshwater forms (notably in the family Atyidae) of tropical countries may attain to the length of a foot. For illustration, see CRUSTACEA.

Praxinoscepe. See ZOETROPE.

Praxiteles, one of the greatest sculptors of ancient Greece, of whose life little is known, except that he was a citizen of Athens, and lived in the 4th century B.C. His principal works—nearly all of which have perished—were statues of Aphrodite (at Cos, Chidrus, Thespia, and elsewhere, of which that of Chidrus was the most famous), Eros (at Thespia), Dionysus (at Elis, Athens, Megara, and other places), Apollo (the best representing Apollo as the Python-slayer), and Hermes carrying Dionysus (found at Olympia in 1877). Feminine beauty and Bacchic pleasures were his favourite subjects; and in his treatment of these he displayed unrivalled sweetness, grace, and naturalness. His gods and goddesses were not very divine, but they were ideal figures of the fairest earthly loveliness.

Prayer is a universally acknowledged part of the worship due to God; not merely petition, but praise, adoration, confession of sin, and thankful acknowledgment of mercies received. It is a simple and natural expression of dependence, which seems almost necessarily to follow from a belief in the existence of a god. Accordingly we find it both where the object of worship is one Supreme Being and in systems of polytheism. But a difficulty presents itself in respect to what may be called the theory of prayer. How does prayer fit into the natural chain of cause and effect? How can it be supposed to influence the divine mind or will? How can a belief in its power be reconciled with any view of the divine decrees, from the most absolute doctrine of predestination to the most modified scheme which recognises the Creator as supreme in the universe? Such questions bring up the same difficulty which attends all other questions of the relations between the

human will and the divine, the freedom of man and the sovereignty of God. But whatever seeming inconsistencies may be implied in speculation concerning them, the necessity of prayer and the power of prayer are acknowledged equally by men of the most opposite views; and generally with an acknowledgment of the inability of the human mind to solve some of the problems which are thus presented to it. The extreme predestinarian includes prayer among the means decreed of God along with the end to which it contributes. By many who would concede no other function, prayer is regarded as of great value in its reflex influence on the feelings of the worshipper. It tends to merge in communion with God. The Protestant churches all hold that prayer is to be made to God alone; but in the Roman Catholic Church, and to some extent in the oriental churches, prayer of a kind is made also to saints, the Virgin Mary, and angels. But as the worship (*douleia*) of the saints differs from that (*latreia*) offered to God, so the invocation of saints and angels is not for the purpose of obtaining mercy or grace from them directly, but in order to ask their prayers or intercession with God on our behalf. For this practice Catholics rely not on the direct authority of Scripture, but on the unwritten word of God conveyed by tradition from very early times. The inscriptions in the catacombs prove that the church of the first centuries invoked the saints; and the famous fathers of the 4th century expressly insist on such invocation. Protestants hold that prayer ought to be conducted in a language known to the worshippers. The Church of Rome has, on the contrary, maintained the general use of the Latin language, even though that language is unknown to most of the worshippers.

Forms of prayer for public use grew up in the earliest times, naturally and inevitably: the Lord's Prayer being doubtless regarded as a warrant and a model. Apparently the most primitive collection is that in the eighth book of the pseudo-Clementine *Apostolic Constitutions* (q.v.). The prayers in connection with the celebration of the eucharist in the Greek and Roman communions are dealt with at LITURGY. The most important post-Reformation collection of prayers, that of the Anglican Church, is dealt with in the next article. But most of the leading reformers prepared prayer-books. Luther's date from 1523 and 1526, Calvin's from 1538 (from Strasburg) and 1541 (from Geneva), John Knox's for the Church of Scotland (based on that of Geneva) from 1554. The growth of Puritan feeling in Britain led the Nonconformists, Presbyterians, and others to underrate the advantages of set forms of prayer, and to exalt the value of what is assumed to be the spontaneous utterance of the heart. And ultimately it became usual to regard liturgical forms as essentially Episcopalian and un-Presbyterian, though the forms of church government are irrelevant to the question of the best mode of guiding congregational prayer.

PRAYER FOR THE DEAD, in the Roman Catholic, the Greek and other oriental churches, is offered with the intention and expectation of obtaining for the souls of the deceased an alleviation of their sufferings after death on account of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. The practice of praying for the dead is usually associated with the doctrine of Purgatory (q.v.) or with the belief in a progressive intermediate state (see HELL). It being once supposed that relations subsist between the two worlds, that their members may mutually assist each other, it is almost a necessary consequence of the doctrine of purgatory that the living ought to pray for the relief of their suffering brethren beyond the grave. It seems

certain that some such doctrine existed in most of the ancient religions. Its existence among the Jews is attested by the well-known assurance in 2 Maccabees, chap. xii., that 'it is a holy and wholesome thought to pray for the dead, that they may be loosed from their sins.' Catholics contend that the doctrine as well as the practice is equally recognisable in the early Christian church. They rely on the parable of Lazarus and the rich man (Luke, xvi. 19-31), as establishing the intercommunion of this earth with the world beyond the grave; and on Matt. xii. 32, as proving the remissibility of sin or of punishment after death; as well as on 1 Cor. xv. 29, as attesting the actual practice among the first Christians of performing or undergoing certain ministrations in behalf of the dead. The Fathers of the 2d, 3d, and still more of the 4th and following centuries frequently allude to such prayers, as Clement of Alexandria, Tertullian, St Cyprian, and especially St John Chrysostom, Cyril of Jerusalem, and St Augustine. The liturgies, too, of all the rites without exception contain prayers for the dead; and the sepulchral inscriptions from the catacombs, which reach in their range from the 1st to the 5th century, contain frequent prayers in even greater variety. In the services of the mediæval and later church prayers for the dead form a prominent and striking element (see REQUIEM). The Protestant churches without exception repudiated the practice. In the burial service of Edward VI.'s First Common Prayer-book some prayers for the deceased were retained; but they were expunged from the Second Book; and no trace is to be found in that sanctioned under Elizabeth. Still it is not expressly prohibited, and it is cherished as a private and pious aspiration by not a few within the modern Church of England, as, in Coleridge's phrase, 'something between prayer and wish—an act of natural piety sublimed by Christian hope.'

On the doctrine of prayer, see Bickersteth, *Treatise on Prayer* (1856); Canon Liddon, *Some Elements of Religion* (1872); Newman Hall, *Prayer: its Reasonableness and Efficacy* (1875); Jelliffe, *The Efficacy of Prayer* (Donellan Lecture, 1877); the treatises on Apologetics, and manuals of Theology. On prayer for the dead, see Plumptre, *The Spirits in Prison* (1884); Luckock, *After Death* (1879), and *The Intermediate State* (1890). For modern scientific objections, see Romanes, *Christian Prayer and General Laws* (1874); Tyndall's British Association lecture (repub. 1874); and a series of articles in connection with Tyndall's 'Prayer Test' in *Contemp. Rev.*, vols. xx.-xxii., by Tyndall, Galton, and others, with answers by McCosh, the Duke of Argyll, and others. For other questions connected with prayer, see the articles AVE, PATERNOSTER, KNEELING, ROSARY, SAINTS, FAITH-HEALING.

Prayer, Book of Common. By this name are known the service-book of the Church of England and the corresponding formularies of other Episcopal churches which have either been derived from the Church of England or largely influenced by it, such as the Episcopal Church of the United States of America, the Church of Ireland, and the Episcopal Church in Scotland. The full title of the English Book of Common Prayer (viz. 'The Book of Common Prayer, and Administration of the Sacraments, and other Rites and Ceremonies of the Church, according to the use of the Church of England: together with the Psalter, or Psalms of David, pointed as they are to be sung or said in Churches; and the Form or Manner of Making, Ordaining, and Consecrating of Bishops, Priests, and Deacons') declares the varied character of its contents, and indicates that the volume includes many services besides those (viz. Morning and Evening Prayer) to which the term 'Common Prayer' is strictly applied in the technical language of liturgiologists. Thus it will be seen that this compendious service-book embraces elements

corresponding to parts not only of the Breviary (q.v.), but also of the Missal (q.v.), the Pontifical (q.v.), and the Manual of the mediæval English Church, from which they were chiefly derived.

It is not our province here to consider generally the influences which operated to bring about the Reformation in England. It must suffice to observe that in regard to liturgical changes the main objects aimed at by the English Reformers were (1) to rid the services of features which were regarded as the outcome of superstition and ignorance (e.g. the invocation of saints, unhistorical and absurd legends read among the 'lessons,' &c.); (2) to introduce a more continuous and more extensive reading of Holy Scripture in the public services; and (3) to present all the services of the church in a language 'understood of the people.' The publication in 1890 (from a MS. in the British Museum) of the draft, revised by Crammer, of a reformed Latin breviary shows us how much the mind of the most influential of the English reformers had been influenced by the corresponding labours of Cardinal Quignon (see BREVIARY). The first and second of the objects above referred to were aimed at in this projected work of Crammer, which was probably abandoned because the bolder design of giving the people all the services of the church in their native tongue had begun to be contemplated. Parts of the preface of Quignon's breviary were transferred, with some modifications, to the preface of the First Prayer-book, and still appear in the prefatory remarks entitled, in the present prayer-book, 'Concerning the Service of the Church.'

The first vernacular service put forth by authority for public use was the Litany (1544), differing in but few particulars from the form still to be found in the prayer-book. On the death of Henry VIII. liturgical reformation was less impeded, the advisers of the young king being favourable to change. The administration of the cup to the laity having been sanctioned by convocation and enjoined by parliament (1 Edward VI. chap. 1), a form for communion 'in both kinds,' in the English tongue, to be *added* to the Latin mass, was issued in 1548. But this form served only a temporary purpose, for in the following year (1549) was published and authorised the complete prayer-book in English, known as the First Prayer-book of Edward VI. In this book, with singular ability, attaining at times the level of genius, Crammer and his conditors translated and adapted the laevary services of Matins, Lauds, and Prime, so as to construct the 'Morning Prayer' of the Book of Common Prayer; while, in a similar manner, Vespers and Compline were brought into the form of the 'Evening Prayer.' The English services were shortened chiefly by the great reduction of the number of psalms to be 'sung or said' daily. The lectionary was so arranged that the greater portion of the Old Testament was read through systematically in the course of the year, while the whole of the New Testament (with the exception of the Apocalypse) was read through thrice. The old English missals formed the basis of the English communion service, but therewith were combined the new features which had appeared in the 'Order of the Communion' (1548). The other services, as those for baptism, matrimony, burial, &c., were similarly framed, with much discrimination, from the corresponding mediæval services. The ecclesiastical books of the Eastern Church were not wholly unknown to the Reformers, as is testified to by their adoption of the so-called 'Prayer of St Chrysostom,' and by the unquestionable fact that the Athanasian Creed was translated by them from a Greek and not a Latin text. Occasionally the revisers did not scruple to adopt features from more modern sources (e.g. the *Pia Deliberatio* of the

reforming Archbishop Hermann of Cologne). The liturgical revision of 1549 was conducted in a spirit at once conservative and critical, and is marked by a singular combination of independence with reverence for the past.

Owing partly to home influences and partly to the influence of foreign reformers (many of whom were then resident in England, including Bucer, regius professor of Divinity at Cambridge, and Peter Martyr, regius professor of Divinity at Oxford), Cranmer and his associates ceased to be content with the doctrinal colouring of the First Prayer-book; and in 1552 there appeared a revised book (the Second Prayer-book of Edward VI.), marked by many changes mainly favorable to more Protestant views. As a characteristic example may be cited the change made in the words used at the communion in delivering the consecrated elements. In 1549 the words ran 'The body of our Lord Jesus Christ, which was given for thee, preserve thy body and soul unto everlasting life,' 'The blood of our Lord Jesus Christ, &c.' In 1552 these words were expunged, and for them were substituted 'Take and eat this in remembrance that Christ died for thee, and feed on him in thy heart by faith, with thanksgiving,' 'Drink this in remembrance, &c.' In a similar spirit the 'Invocation' of the Holy Ghost on the elements—'that they be unto us the body and blood of thy most dearly beloved Son'—was removed (together with use of the sign of the cross) from the prayer of consecration. From the baptismal service the exorcism, trine immersion, anointing, and the use of the chrism (or white robe) were omitted. From the burial service prayers for the dead were removed. The vestments of priests and deacons were reduced to the surplice, and those of the bishop to a rochet, for all ministrations. Among changes then made, though of little or no doctrinal significance, may be mentioned the addition of the sentences, introductory address, general confession, and absolution to morning and evening prayer, and of the decalogue and responses to the communion service.

On the accession of Queen Elizabeth the personal ecclesiastical sentiments of that masterful monarch made themselves sensibly felt. In the newly-revised prayer-book of 1559 (Elizabeth's Prayer-book) very few changes were made, but they pointed in one direction. The vestments and ornaments of the prayer-book of 1549 were again enjoined; in the litany the words 'From the tyranny of the bishop of Rome and all his detestable enormities, good Lord, deliver us' were omitted; in the communion service the words of Edward's two books at the delivery of the elements were combined in the form still in use; the declaration concerning kneeling (the so-called 'Black Rubric') appended to the communion service of Edward VI.'s Second Prayer-book was omitted.

During Elizabeth's reign the Puritan and Calvinist party within the church increased in strength, and the hopes of its members were raised high on the accession of James I., educated as he had been in Scotland under Presbyterian influence. Not many days after the king's accession he was presented by the Puritans with a petition, called, from the great number of signatures attached to it, the Millenary Petition. This craved for the removal of 'offences' from the prayer-book. The petitioners further suggested a conference, and to this suggestion the king acceded, the outcome being the Hampton Court Conference (January 14, 16, and 18, 1604), so called from its place of meeting. The issue of this conference was deeply disappointing to the Puritan party. The alterations made were comparatively few and unimportant: certain chapters of the Apocrypha (Tobit, v. vi. and vii., and Dan. xiv.) were removed from the lectionary; the

words 'or remission of sins' were added as explanatory of the word 'absolution' at morning prayer; a prayer for the queen and royal family, together with some special thanksgivings, as 'for rain,' 'for fair weather,' &c., were inserted. The only changes of much significance were (1) the addition to the catechism of the part treating of the sacraments (attributed to the pen of Overall, Dean of St Paul's, and certainly not favourable to the views of the Puritans), and (2) the insistence on baptism being administered by the 'lawful minister,' as the church's order; while the *validity* of baptism administered by any person using water and the prescribed form of words is still implied in the text of the service. It is worth observing that, while to the three earlier revisions and the last revision (1662) were given parliamentary authority (2 and 3 Edw. VI. chap. 1; 5 and 6 Edw. VI. chap. 1; 1 Eliz. chap. 2; 14 Carol. II. chap. 4), James considered that the authority of the crown was sufficient to introduce changes, which he was careful to style 'explanations,' as though they were not additions.

The Book of Common Prayer for the use of the Church of Scotland (1637), commonly known as 'Laud's Prayer-book,' was a revision of the English prayer-book, in the construction of which Wedderburn, Bishop of Dunblane, and Maxwell, Bishop of Ross, were chiefly concerned, their English advisers being Laud, Wren, and Juxon. It is mainly remarkable for its reverting in the communion service to some of the characteristic features of the First Prayer-book of Edward VI.—e.g. (1) the 'Invocation,' and (2) the commemoration of the faithful departed. It is also interesting to notice that the Scottish revision anticipated and happily met some of the difficulties that have since been raised in respect to the Athanasian Creed. The prose psalter of this prayer-book was taken from the authorised version of the Bible. The word 'presbyter' was used instead of 'priest.' The calendar records the names of certain Scottish saints—e.g. Columba, Ninian, Serf, Queen Margaret, &c.

The attempt to force this prayer-book upon the Scottish people in an arbitrary manner, emphasised, as it was, by the riot in St Giles' Cathedral, Edinburgh, on the occasion of its first being read (23d July 1637), and the national uprising that followed are parts of civil history. It should be added that the Scottish prayer-book, which had seemed to be strangled at its birth, was twenty-four years afterwards among the most potent influences affecting the revision which has brought the English prayer-book to its present shape.

During the years of the Great Rebellion it was enacted by an ordinance of parliament (January 3, 1645) that the 'Westminster Directory for the Public Worship of God' should take the place of the prayer-book; and a subsequent ordinance of the same year (August 23) made the use of the prayer-book in public 'or in any private place or family' punishable by a fine of £5 for the first offence, £10 for the second, and a year's imprisonment for the third. This harsh measure went a long way to provoke the reaction of the Act of Uniformity (1662).

On the restoration of the monarchy, in the vain hope of satisfying contending ecclesiastical parties a royal commission was issued (March 25, 1661) to twelve bishops and twelve Presbyterian divines (with nine coadjutors on each side to fill the places of members of the commission who might be absent) 'to advise upon and review the Book of Common Prayer, comparing the same with the most ancient liturgies which have been used in the church in the primitive and present times . . . and, if occasion be, to make such reasonable and necessary alterations, corrections, and amendments as shall be

agreed upon for the giving satisfaction to tender consciences,' &c.

The meetings of the commission were held in the Savoy Palace in the Strand, London, and hence the name the 'Savoy Conference,' by which they are commonly designated. Among the best known of the divines of the Episcopal side were Bishops Cosin, Sanderson, and Brian Walton, with Drs Pearson, Gunning, and Heylin. Among the Presbyterians the most eminent were Baxter, Calamy, Bates, Manton, and Reynolds. One of the most notable episodes in the history of the conference was the presentation by Baxter of a liturgy, composed by himself in the space of a few days, which the Presbyterian commissioners desired should be authorised and placed on a footing of equality with the Book of Common Prayer. The conference, as was to be expected from the temper of the times, ended in the discomfiture of the Puritan party, very few of whose suggestions were adopted. Subsequently royal letters were addressed to Convocation directing the revision of the Book of Common Prayer. This revision brought the book to its present state, with the exception of changes in the lectionary, to be noticed below. The result of the revision was authorised by the Convocations of Canterbury and York, and its use enjoined (19th May 1662) by parliament (Act of Uniformity, 14 Carol. II. chap. 4).

Among the more noteworthy changes made at the last revision may be mentioned a new preface (by Bishop Sanderson); the adoption of the Authorised Version for the Epistles and Gospels, the introduction of the prayer for parliament, of the prayer 'for all conditions of men,' of the general thanksgiving, and some of the special thanksgivings; and the reintroduction in a modified form of the commemoration of the departed in the communion service. While the general framework of the prayer-book was preserved intact, very many minute changes were made, more particularly in the rubrics. Speaking generally, the changes, when they possess any distinctive doctrinal colouring, were marked by the dominant influence of the church party. Two entirely new services were added: (1) a service for the baptism of adults, made desirable by the growth of anabaptism during the Great Rebellion, as well as by the need of a form for the baptism of the heathen in our 'plantations'; and (2) a form of prayer and thanksgiving to be used at sea, with a special view to 'his majesty's navy.' Certain printed copies of this prayer-book, minutely examined and brought into conformity with the MS. copy attached to the act of parliament, were certified as correct, and having the great seal attached to them are known as the *Sealed Books*. One of these sealed copies was deposited in the Tower of London, one in each of the Courts of Law at Westminster, and one with each cathedral chapter.

In the reign of William III. a further attempt was made to revise the prayer-book with a view to the comprehension of dissenters. A royal commission sat and reported, but nothing came of it. In 1872 the table of lessons now in use was approved by convocation, and authorised by parliament. In the following year certain abbreviations in the daily service were similarly sanctioned. In 1906, Convocation received the King's Letters of Business for the revision of the prayer book, and since then various alternative versions have been suggested, to be used at the discretion of the minister. Some of the alterations apply to the order of the prayers in the services, and others to the wording of the psalms so as to make them clearer and more intelligible to the average worshipper. Other emendations, however, affecting thought and dogma have been the subject of

considerable discussion between the Evangelical, Modernist, Anglo-Catholic, and other sections of the Anglican Church. While there appears to be general agreement about the desirability of some revision of the prayer-book, there exists much diversity of opinion about the manner in which this revision should be carried out. For the use of the *Quincunx Valt*, see *ATHANASIAN CREED*.

In Ireland it may be noted that the first book ever printed in Dublin was the First Prayer-book of Edward VI. It appeared in 1551. The Second Prayer-book of Edward was never introduced. Elizabeth's prayer-book was enjoined by the Irish parliament in 1560, and similarly in 1662 the prayer-book as revised after the Savoy Conference. On the disestablishment of the Irish Church (1869) a revision of the prayer book was carried through by the General Synod, after a contest between church parties extending over several years. In 1878 the revised prayer-book was published. Among the more important changes are (1) the removal of the rubric preceding the Athanasian Creed; (2) the addition of a question and answer to the Catechism declaring that the body and blood of Christ are 'taken and received only after a heavenly and spiritual manner'; (3) the absorption in the visitation of the sick changed into the form in the communion service; (4) lessons from the Apocrypha removed.

In the Episcopal Church of the United States of America a revised edition of the English prayer-book was authorised and published in 1789. The changes made were very numerous. We can here specify only the following: (1) the removal of the Athanasian Creed; (2) the introduction of the 'invocation' on the elements in the communion service, this latter being at the suggestion of Seabury, the first American bishop. He had been consecrated in Scotland, and was warmly attached to the Scottish Communion Office, of which the 'invocation' is a characteristic feature. A further revision was undertaken in 1881, and after more than nine years' work the result was published in 1892. In many particulars it reverts to the English prayer-book which had been abandoned in 1789; but neither of the two features noticed above has been altered.

In the Episcopal Church in Scotland the English prayer-book is formally declared to be the 'only authorised service book of this church for all the purposes to which it is applicable' (Canon xxviii.); but a service for the Holy Communion (brought to the form in current use in 1764) is sanctioned in some congregations under certain restrictions. At all consecrations, ordinations, and synods the form in the English prayer-book is required to be used. The Scottish Communion Office is based on the corresponding service in Laud's prayer-book, but many important changes have been made. Among the most noteworthy are (1) the transposition of the place of the prayer of consecration in relation to the prayer for 'the whole state of Christ's Church'; (2) the omission of the words 'militant here in earth'; (3) the alteration in the order of the parts of the prayer of consecration, so that it runs, (a) words of institution, (b) oblation, (c) invocation; (4) the substitution, in the invocation, of the words, 'that they may become the body and blood,' &c., for 'that they may be unto us the body,' &c. This last change is for its abruptness without parallel or precedent.

For the materials from which the prayer book has been mainly constructed, consult Maskell's *Monumenta Ritualiæ Ecclesiæ Anglicanæ* (2d ed. 1882), and *The Ancient Liturgy of the Church of England* (3d ed. 1882); *Missale ad usum Sarum* (Huntliand ed. 1861-67); *Breviarium ad usum Sarum*, edited by F. Procter and C. Wordsworth (1879-86); *Breviarium Romanum Quinquagesimum*, edited

by J. W. Legg (1888). The successive changes made in the English Prayer-book and the Scottish Prayer-book (1888).

Edward VI. (1877). For the history of the prayer-book, see Proctor's *History of the Book of Common Prayer* (1855; revised and rewritten by Frere, 1901); *The Prayer Book in its Literary and Liturgical Aspects*, by Bishop Dowden (1900); J. H. Blunt's *Annotated Book of Common Prayer* (revised ed. 1884); Cardwell's *History of Conferences connected with the Revision of the Book of Common Prayer* (2d ed. 1841). Parker's *Introduction to the History of the successive Revisions of the Book of Common Prayer* (1877) is invaluable. See also Brightman's *Sources and Revisions of the Book of Common Prayer* (1915), and the two reports issued by the S.P.C.K. in 1916 and 1922. Cranmer's attempts at a revision of the Breviary are exhibited in *Edward VI. and the Book of Common Prayer* (1890), by Casquet and Bishop. Much curious information on the mediæval liturgies of England, more particularly that of York, will be found in the *Lay Folk's Mass Book*, edited for the Early English Text Society by T. F. Simmons (1879). Among commentaries on particular parts of the prayer-book, Scudamore's *Notitia Eucharistica* (2d ed. 1876) and Bulley's *Variations in the Communion and Baptismal Offices* (1842) are of much value. A facsimile of the MS. of the prayer-book attached to the Act of Uniformity (1662) was produced in photo-lithograph in 1890. On the history of the Scottish and American Communion Offices, see Dowden's *Annotated Scottish Communion Office* (1884), Hart's edition of *Seabury's Communion Office* (1874), and Harlington's *Short History of the Book of Common Prayer* (New York, 1893). And see Harford and Stevenson's *Prayer-Book Dictionary* (1912) and *A Prayer-Book Revised* (by High Church scholars, 1913).

Prayer Beads, a name given to the polished seeds of a tropical leguminous plant, *Abrus precatorius* or 'Crabs'-eyes, formerly much used for stringing into rosaries, necklaces, &c.

Praying Wheel, an instrument for offering prayers by mechanical means, used exclusively by the Lamaist Buddhists, on the assumption that the efficacy of prayer consists in the multiplicity of its repetition. These instruments are of various shapes and sizes, from small cylinders turned by hand to huge ones driven by water or wind. Long strips of paper with a written or printed formula, which translated reads 'The Jewel in the Lotus, Amen,' repeated hundreds or even thousands of times, are wrapped round these cylinders, and as the cylinders revolve the paper rolls uncoil, and so the prayer is said.

Preaching, or systematic instruction in religion given by word of mouth, traces its ancestry to the function of the ancient Israelitish prophets. Justin Martyr (*Ap. mag.* chap. 67) and Tertullian (*Apol.* chap. 39) describe the exhortations that followed the reading of Scripture in their time; but Origen was the earliest preacher in the modern sense of the word. In the early church the bishop was long responsible for the preaching, although presbyters and deacons came to be employed, as Origen was before his ordination, and Constantine frequently. Monks were not allowed to preach until the special preaching-orders were organised in the middle ages, nor yet women, although the Montanist heretics permitted them. Sermons were usually delivered on Sundays, as part of the regular religious service, and approbation was expressed by stamping of feet and clapping of hands, a practice which Chrysostom condemned. After the 9th century preaching appears to have declined, and indeed it never seems to have flourished much at Rome. The mediæval sermon gradually took the form of a short address after mass; but, with the rise of the Franciscan and Dominican orders, we find a great revival of preaching, in form popular, racy, the anecdotes told and spiritualised

perforce (*Exempla*) often anything but edifying in themselves. Among the most famous of the mediæval preachers were Antony of Padua, Bernard of Clairvaux, Bonaventura, Berthold the Franciscan of Regensburg, John of Monte Corvino, Savonarola, John Tauler of Strasburg, and Francis Coster (1531-1619). The Reformers were preachers to a man, and the swift progress of the new doctrines was in great measure due to the power with which they were given forth from the pulpit. As sacramentarianism lost hold of men's consciences, the higher appeared the value of the sermon. Wyclif and his Poor Priests, and after him the Lollards, established an evangelical tradition of the supremacy of the pulpit as a means of grace, which we find at its greatest strength in Puritanism. Seventeenth-century preaching was very scriptural, and put in the foreground the fall of man, the doom of sin, the redemption of Christ, the sanctifying work of the Holy Spirit. Its weakness was a tendency to be over-abstract, and to become theological rather than religious. In the unspiritual barrenness of the 18th century preaching became mainly ethical and apologetic; but, as Dr Johnson says, men at last got tired of hearing the apostles tried once a week for the crime of forgery, and turned for relief to listen to the earnest direct harangues of a Wesley and a Whitefield. The whole century could show no preachers to be compared with Latimer, Donne, Hall, Andrewes, Jeremy Taylor, Howe, Baxter, as well as Fuller, Sanderson, South, Barrow, and Tillotson: still less with their magnificently eloquent French contemporaries Saurin, Bourdaloue, Bossuet, Fénelon, Massillon, La Rue, and Fléchier. Reading gained ground in the 18th century, and sermons were bought, borrowed, or stolen by preachers less honest than Sir Roger de Coverley's chaplain. The great French preachers recited their sermons, apparently finding it easier than Englishmen to revive premeditated emotion.

Pre-Adamites. See ADAM.

Prebend. See CATHEDRAL.

Precedence, the order in which individuals are entitled to follow one another in a state procession or on other public occasions. In England the order of precedence depends partly on the statute of 1539, partly on subsequent statutes, royal letters-patent, and ancient usages. Among questions of precedence depending on usage there are some which can hardly be considered so settled as to be matter of right, and are in a great degree left to the discretion of the crown, which generally refers any disputed question to the officers of arms. In Scotland the Lyon Court has the direct jurisdiction in all questions of precedence.

It is a general rule of precedence that persons of the same rank follow according to the order of the creation of that rank; and in the precedence of the English peerage it has been fixed that the younger sons of each preceding rank take place immediately after the eldest son of the next succeeding rank. Married women and widows take the same rank among each other as their husbands, except such rank be professional or official, and it is an inviolable rule that no office gives rank to the wife or children of the holder of it. Unmarried women take the same rank with their eldest brother; the wife of the eldest son, of any degree, however, preceding the sisters of her husband and all other ladies in the same degree with them. Marriage with an inferior does not take away the precedence which a woman enjoys by birth or creation; with this exception, that the wife of a peer always takes her rank from her husband. The following tables exhibit the precedence of different ranks as recognised by law in England.

TABLE OF PRECEDENCE IN ENGLAND.

The Sovereign.
The Prince of Wales.
Sons of the Sovereign.
Grandsons of the Sovereign.
Brothers of the Sovereign.
Uncles of the Sovereign.
The Sovereign's brothers' or sisters' sons.
Ambassadors.
Archbishop of Canterbury.
Lord High Chancellor.
Archbishop of York.
Prime Minister.
Lord President of the Privy-council.
Speaker of the House of Commons.
Lord Privy Seal.
Lord Great Chamberlain. } Above all of
Earl Marshal. } their degree;
Lord Steward. } if Dukes, above
Lord Chamberlain. } all Dukes, &c.
Dukes, according to their creation: (1) of
England, (2) Scotland, (3) Great Britain,
(4) Ireland, (5) since the Union.
Eldest sons of Dukes of the Blood Royal.
Marquises, in same order as Dukes.
Dukes' eldest sons.
Earls, in same order as Dukes.
Younger sons of Royal Dukes.
Marquises' eldest sons.
Dukes' younger sons.
Viscounts, in same order as Dukes.

Earls' eldest sons.
Marquises' younger sons.
Bishops of London, Durham, and Winchester.
All other English Bishops according to seniority of Consecration.
Secretaries of State, if Barons.
Barons, in same order as Dukes.
Treasurer of H.M. Household.
Comptroller of H.M. Household.
Vice-chamberlain of H.M. Household.
Secretaries of State, under degree of Baron.
High Commissioners.
Viscounts' eldest sons.
Earls' younger sons.
Barons' eldest sons.
Knights of the Garter, if Commoners.
Privy-councillors, if of no higher rank.
Chancellor of the Exchequer.
Chancellor of the Duchy of Lancaster.
Lord Chief Justice.
Master of the Rolls.
President of Probate Court.
Lords Justices of Appeal.
Judges of the High Court of Justice.
Chancery's younger sons.
Barons' younger sons.
Sons of Life Peers.
Baronets of either kingdom, according to date of patent.

Knights Grand Cross of the Bath.
K. Grand Commanders of Star of India.
K. Grand Cross of St. Michael and St. George.
K. Grand Commanders of Indian Empire.
K. Grand Cross of the Royal Victorian Order.
K. Grand Cross of British Empire.
Knights Commanders of the above Orders.
Knights Bachelors.
Judges of County Courts and of Mayor's and City of London Court.
Sergeants at Law.
Masters in Law.
Companions of above Orders, and of Distinguished Service Order; Members of Victorian Order (4th class); Officers of the British Empire; Members of Imperial Service Order.
Eldest sons of the younger sons of Peers.
Baronets' eldest sons.
Eldest sons of Knights in order of their fathers.
Members of Royal Victorian Order (5th class) and of British Empire.
Younger sons of younger sons of Peers.
Baronets' younger sons.
Knights' younger sons.
Naval, Military, and other Esquires by

At the coronation of Charles I. the rule of precedence of the nobility of England was introduced in Scotland; and it was arranged that peers of England (or their sons, &c.), of a given degree, should within England take precedence of peers of Scotland of the same degree; and that in Scotland this precedence should be reversed. But by the acts of union with Scotland and Ireland the precedence in any given degree of the peerage has

been established as follows: (1) Peers of England; (2) Peers of Scotland; (3) Peers of Great Britain; (4) Peers of Ireland; (5) Peers of the United Kingdom, and Peers of Ireland created subsequently to the Irish Union.

The order of precedence in Scotland is recorded in the Lyon Office. It is founded partly on usage and partly on the statutes of 1623 and 1661, but was carefully revised in 1905, and is as follows:

The Sovereign.
Lord High Commissioner during sitting of General Assembly.
The Duke of Rothesay (Prince of Wales).
Younger sons of the Sovereign.
Grandsons of the Sovereign.
Brothers of the Sovereign.
Uncles of the Sovereign.
Nephews of the Sovereign.
Lords-lieutenant of Counties, Lord Provosts of cities being *ex-officio* Lord-lieutenant of Counties of Cities, and Sheriff Principal when within their jurisdiction, in the order named.
Lord Chancellor of Great Britain.
Moderator of General Assembly.
Prime Minister.
Keeper of Great Seal of Scotland (Secretary for Scotland), if a peer.
Keeper of Privy Seal of Scotland, if a Peer.
Hereditary High Constable of Scotland.
Master of the Household in Scotland.
Lord Chancellor, or Lord Keeper, if Baron.
Dukes, as in English precedence.
Eldest sons of Dukes of the Blood Royal.
Marquises, as in England.
Eldest sons of Dukes.
Earls as in England.
Younger sons of Royal Dukes.
Eldest sons of Marquises.
Younger sons of Dukes.

Keeper of Great Seal of Scotland (Secretary for Scotland), if not a Peer.
Keeper of the Privy Seal, if not a Peer.
Lord Justice-general.
Lord Clerk-register.
Lord Advocate.
Lord Justice-clerk.
Viscounts, as in England.
Eldest sons of Earls.
Younger sons of Marquises.
Barons, as in England.
Eldest sons of Viscounts.
Younger sons of Earls.
Eldest sons of Barons.
Knights of the Garter.
Privy-councillors.
Lords of Session (by date of appointment) and Chairman of Land Court.
Younger sons of Viscounts.
Younger sons of Barons.
Sons of Law Life Peers.
Baronets.
Knights of the Thistle.
Knights of St. Patrick.
Knights Grand Cross of the Bath.
Knights Grand Commander of the Star of India.
Knights Grand Cross of St. Michael and St. George.
Knights Grand Commanders of the Indian Empire.
Knights Grand Cross of the Royal Victorian Order.

Knights Grand Cross of the British Empire.
Knights Commanders of the above Orders.
Solicitor-general for Scotland.
Lyon King-of-Arms.
Sheriffs Principal.
Knights Bachelor.
Sheriffs Substituted.
Companions of the above Orders.
Commanders of the Royal Victorian Order.
Commanders of the British Empire.
Companions of the Distinguished Service Order.
Members of Fourth Class of Royal Victorian Order.
Officers of the British Empire.
Companions of the Imperial Service Order.
Eldest sons of younger sons of Peers.
Eldest sons of Baronets.
Eldest sons of Knights of the Garter, of the Thistle, and of St. Patrick.
Eldest sons of Knights.
Members of Fifth Class of Royal Victorian Order.
Members of the Order of the British Empire.
Younger sons of Baronets.
Younger sons of Knights.
King's Counsel.
Esquires.
Gentlemen.

There are rules for precedence for the members of the different professions, recognised among themselves, but giving no general social precedence. No rank, for instance, in the army, however high in itself, entitles its holder to precedence. Doctors in the universities are ranked thus: (1) Divinity, (2) Law, (3) Medicine. Official rank may often place its possessor, upon occasion of public ceremonies, in a position far above others of higher dignity than himself, but this, of course, confers no rank in the general order of civil precedence; on the other hand, men of official rank, who have higher personal precedence, are placed according to the latter: the wives and children of all those who

derive their places on the scale from official rank have no consequent privilege. One of the leading principles of the law of precedence is that it emanates solely from father or husband, and cannot be acquired through a female unless in the case of a peeress in her own right.

Preceptor, the head of certain provinces of the order of the Templars (q.v.).

Precession, the name given to a slow motion of the earth, under the action of the sun and moon, which causes the poles of the heavens (which must remain always vertically above the poles of the earth) to describe circles on the sphere of the

heavens about the poles of the ecliptic as centres. As the places of stars on celestial charts are marked with reference to the celestial poles, this motion of these poles causes all such charts to become less and less accurate with the lapse of time. A correction for precession has therefore to be applied to such charts in order to find the true places of stars at any epoch other than that for which they are constructed. This motion of the earth also causes the Equinoxes (q.v.) to recede slowly along the ecliptic, so that the sun comes to them, in his annual course, a little *earlier* each year. Hence the name, '*Precession of the Equinoxes*.'

The physical cause of this motion is the attraction of the sun and moon for the protuberant part of the earth around the Equator (see EARTH). This causes the earth slowly to turn on itself, as a spinning top *gyrates* when its speed slackens before it falls. As this disturbing force on the earth is small relatively to its mass, this turning takes place at the mean rate of only 50"·1 per annum. It requires, therefore, 25,868 years for the equinoxes to describe a complete circle on the ecliptic. For a very interesting case of the effect of precession, see POLE-STAR. In actual observation the effects of precession are complicated with those of Nutation (q.v.) and of change of inclination of the ecliptic.

Précieuses. See RAMBOUILLET.

Precious Stones. See STONES (PRECIOUS).

Precipitate Ointment is of two kinds, the *red* and the *white*. The former contains red oxide of mercury, the latter ammoniated mercury chloride, or white precipitate. In both cases great care is necessary that the mercury preparations are in a very fine state of division, and are intimately mixed with the ointment base. Both ointments are highly stimulating, and are of service in cutaneous eruptions. The *red* ointment is also employed in chronic conjunctival ophthalmia.

Precipitation, in Chemistry, is an operation in which decomposition occurs in a fluid, either through the action of the air, or of a gas, or of a chemical agent in solution; and is accompanied by the deposition of a solid substance that was previously held in solution or has been formed by chemical action.

Pre cognition. See CRIMINAL LAW (*Scots*).

Predella (Ital.), the step or ledge sometimes seen at the back of an altar; also the frieze or band of pictures along the bottom of an altar-piece.

Predestination, the eternal decree of God, whereby 'the elect' are foreordained to salvation. The correlative decree, whereby others are held to be foreordained to perdition, is commonly distinguished by the other term—Reprobation. The theory of predestination had its origin in the attempts of theological system to define the relations of the human and the divine will, and to reconcile the phenomena of human freedom with the belief in divine omnipotence. God's absolute will is represented by it as determining the eternal destiny of man, not according to the foreknown character of those whose fate is so determined, but according to God's own mere choice. They who are thus foreordained to eternal life are led to believe and live by the 'irresistible grace' of the Holy Spirit. In human salvation, therefore, God's will is everything, man's nothing. The principal scripture passage is Rom. viii. 29, 30. It was in the discussions between Pelagius and Augustine that the predestinarian view of the divine 'decree' was first fully evolved; and since their time opinion in the church has run in two great currents—the one perpetuating the influence of Pelagius,

who regarded that decree as subordinated to the divine foreknowledge of human character; the other that of Augustine, who maintained the absolutism of that decree, and its independence of all prior human conditions. Pelagius recognised a possibility of good in human nature; Augustine denied any such possibility apart from the influences of divine grace. The one held that the choice of salvation lay in man's will; the other that man's will had no active freedom or power of choice since the fall. In 529 the system of Augustine was established by the Council of Arausio (Orange) as the rule of orthodoxy in the Western Church; but the reaction against the strictly logical nature of his dogma has been perpetually manifested by representatives of the more humane, though perhaps less logical doctrine of Pelagius, in every period of the church. Gottschalk, a German monk of the 9th century, carried the doctrine to its most extreme development. The Thomists (see AQUINAS), as predestinarians, opposed the Scotists, though Thomists insisted that God willed the salvation of all and has provided the means. The reformers Luther, Zwingli, and Calvin were Augustinians, though the Lutheran doctrine as formulated by Melancthon is plainly different from that of Calvin and the Reformed Church. Some Jesuits are Congruists or modified Thomists; others admit that predestination to grace, but deny that predestination to glory, is irrespective of merit. Jansenism was a revival of Augustinianism. Arminius and the Synod of Dort mark a new period of the controversy. With such opposite representatives as Laud and Hales, a large part of the Church of England 'bade John Calvin good-night.' The followers of Wesley and Whitefield differed on this great doctrine. Even the Presbyterian churches, or large sections of them, have modified their high predestinarian doctrine in at least the statement of it. The common Augustinian doctrine of the Calvinistic symbolical books is called 'infralapsarianism'; moderate Calvinists or 'sublapsarians' hold that the fall of man (*lapsus*) was foreseen but not decreed by God (thus trying to avoid ascribing to God the origin of sin); while extreme predestinarians or 'supralapsarians' affirm that God not only foresaw and permitted, but decreed the fall of man, overruling it for good. Jonathan Edwards (q.v.) is a modern representative of rigid Calvinism. Catholics hold that the question is one rather of metaphysics than of faith.

See the article WILL and works there quoted, and the articles on Augustine, Pelagius, Calvin, Jansen, &c.; the theological handbooks of dogmatics; Luthardt, *Vom freien Willen* (1863); Forbes, *Predestination and Free-will* (1878); Canon Mozley, *Treatise on the Augustinian Doctrine of Predestination* (1878).

Predicables. This is a term in the scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan: *genus*, *species*, *difference* (differentia), *property* (proprium), and *accident* (accidens). The first two—Genus and Species—name the higher and lower classes of the things classified; a Genus comprehends several Species. The other three designations—Difference, Property, Accident—express the attributes that the classification turns upon. The Difference is what distinguishes one species from the other species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other species of the genus *felis*. The Property expresses a distinction that is not ultimate, but a consequence of some other peculiarity. Thus, 'the use of tools' is a property of man, and not a difference, for it flows from other assignable attributes of his bodily and mental organisation, or from the specific differences that characterise

him. The Accident is something not bound up with the nature of the species, but chancing to be present in it. Thus, the high value of gold is an Accident; gold would be gold though it were plenty and cheap. See CATEGORIES, GENERALISATION.

Pre-established Harmony. See LEIBNIZ.

Pre-existence. The notion that human souls were in existence before the generation of the bodies with which they are united in this world was anciently, and is still, widely spread throughout the East. The Greek philosophers, too, especially those who held the doctrine of transmigration, as the Pythagoreans, Empedocles, and even Plato—if with him transmigration is not simply a symbolical myth—were familiar with the conception. Plato taught that all human souls had existed from the very beginning, still and silent, in the realm of potentiality, and Origen introduced the theory into Christian theology. Among the early Christians the assumption of such pre-existence was connected with the belief that God had created the souls of men before the world, and that these were united with human bodies at generation or at birth. Another view long prevalent in the Western Church was that of Traducianism, according to which children received soul as well as body from their parents through natural generation. The third theory, which ultimately became that of the orthodox, was Creationism, according to which each soul is created successively. Almost every one is familiar in dreams, and even in a waking state, with a haunting sense of a want of reality in the common objects around, and a vague consciousness that everything one sees or hears has happened before, when we seem, in the words of Tennyson,

To lapse far back in a confused dream
To states of mystical similitude.

There is a striking expression of this experience in Sir Walter Scott's *Diary*, under 17th February 1828, and also an interesting allusion in *Guy Rimering*. And Wordsworth has given supreme poetical expression to it in his *Intimations of Immortality* (the germ of which will be found in a less known poem of Vaughan the Silarist). Direct intellectual interest in the doctrine of pre-existence has nearly ceased, yet the dream has again and again haunted individual thinkers. See M'Taggart, *Human Immortality and Pre-existence* (1915).

Prefect (Fr. *préfet*, from Lat. *præfectus*; see PRÆFECT), the administrative head of a modern French department (see FRANCE), whose duties correspond with those of the old *Intendant* before the Revolution.

Pregnancy. The first symptom which calls attention to the occurrence of pregnancy is usually absence of the menstrual flow. This may, of course, be suppressed by many other causes; and, exceptionally, may persist during the first few months of pregnancy. 'Quickening,' or the sensations experienced in consequence of the movements of the fetus, is usually noticed in the fourth month. Of the changes which take place elsewhere than in the generative organs the first and most noticeable is sickness, usually occurring in the early morning, and not persisting beyond the first three months. 'Longings,' or cravings for special, and sometimes very curious articles of diet, are not unusual. The heart becomes enlarged in order to provide the increased blood-supply necessary for the nutrition of the fetus. There is often an increased liability to toothache, fainting, and other disturbances of health; and not unfrequently the disposition is altered, and an unnatural fretfulness or irritability manifests itself. In some cases, on the other hand, the health is exceptionally good. The duration of pregnancy is, in the great majority of cases, about

275 days; but, as variations of a week or ten days in either direction are common, it is impossible to predict the exact date of delivery. Well authenticated cases have occurred where it has been prolonged to nearly 300 days. It may, of course, come to an end at any time prior to its proper term (see FETUS). There is a curious condition called *spurious pregnancy*, which may so closely simulate true pregnancy in all its main features as entirely to deceive the patient as well as others. It is generally associated with Hysteria (q.v.) or some allied mental disturbance (see MARY L. and SOUTHCOTT). A careful examination enables a medical man to detect the mistake; but it may be difficult to persuade the patient and her friends of it. As a work of reference for others than specialists, Chavasse's *Advice to a Wife on the Management of her Health* (1842; new ed. 1915) may be recommended, and for nurses, Johnstone's *Text-book of Midwifery* (5th ed. 1926).

CONCEALMENT OF PREGNANCY is a criminal offence, or rather it is taken to be the main proof of the offence of concealing the birth of a child in certain circumstances. See BIRTH.

Prehnite, a hydrous silicate of alumina and lime. It differs from zeolites in yielding water only at a red heat. It is a widely diffused mineral, and, although first discovered at the Cape of Good Hope, has been found in great beauty in some places on the continent of Europe and in Scotland. Prehnite exhibits a great variety of forms, being found in crystals in fan-shaped and cockcomb-like groups, granular, reniform, fibrous, &c. It is sometimes colourless, but more generally greenish, and sometimes yellowish. It occurs, as a product of the alteration of various silicates, in veins and cavities chiefly in basic igneous rocks, such as dolerite and basalt. Less commonly it is met with under similar conditions in granitoid and schistose rocks, and occasionally in lodes associated with copper.

Prelate (Lat. *prælatus*, 'one set over'), in Church law, is the name given to the holders of those higher dignities in the church, to which, of their own right, is attached a proper jurisdiction, not derived by delegation from any superior official. In this sense the name comprises not only prelates of the first class, as bishops, but also the heads of religious orders, abbots or priors of religious houses, and other similar ecclesiastical dignitaries. In the pope's court and household many of the officials, although not possessing episcopal or quasi-episcopal jurisdiction, have the insignia and title of prelate; and these honours are frequently bestowed on clergy whose duties keep them far from Rome.

Prelude (Lat. *præ*, 'before, and *ludo*, 'I play'), the introductory movement of a musical work (see INTRODUCTION). The first movement of a suite was usually a prelude; and the term is especially associated with the pieces prefaced by Bach to his celebrated clavichord and organ fugues. It has also been applied, without special significance, by Chopin to his collection of short pieces, op. 28. Its form is indeterminate, but the piece is always in the same key as that succeeding it.

Premature Interment. See BURIAL.

Premature Labour. See ABORTION, FETUS, BIRTH.

Premier. See TREASURY, CABINET.

Pre-millennarians. See MILLENNIUM.

Premonstratensians (called also NORBERTINES), an order of regular canons, founded by St Norbert, a canon of Cleves, in 1119, at a place in the forest of Concy, pointed out in a vision, and thence called *Prémontré* (Lat. *Præmonstra-*

tum, 'the meadow pointed out'). Their habit was white, hence in England they were commonly called the White Canons. Norbert organised his new order, which was substantially a branch of the Canons Regular of St Augustine, as well with a view to the sanctification of the members as to their usefulness in effecting the reformation of the age. Himself a man of remarkable piety and austerity of life, his rule is a return to the primitive fervour of the monastic institute; and the great work which he proposed for his brotherhood, in addition to the daily choral services of the church, was the practical instruction of the people, and the direction of consciences in the confessional. It was taken up with ardour, and spread rapidly in France and the Low Countries, and afterwards - on Norbert's being chosen, in 1127, Archbishop of Magdeburg—in Germany; the abbot of the mother house at Concy, however, retaining the rank of general and of superior of the entire order. In 1512 all the abbeyes in England and Wales were placed under the Abbot of Welbeck. There, just before the dissolution, were thirty-five houses; in Scotland there were six, one of them Dryburgh. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain. In the same spirit of reformation Norbert established an order of nuns, which attained to equal success. Holyot states that at one time there were as many as a thousand Premonstratensian abbeyes, besides provostships and priories, and 500 houses of nuns, mostly in France, Germany, and the northern kingdoms. Leeney, the last abbot of Premontré, died so late as 1834. The abbeyes were proscribed at the Revolution, and even in Germany, Belgium, and Austria there remain only miserable fragments of their former splendour, though the 20th century has seen a revival.

Prentice Pillar. See ROSLIN.

Prenzlau. or PRENZLOW, an agricultural town of Prussia, stands at the northern end of Lower Lake Ucker, 67 miles by rail N.N.E. of Berlin. It has a beautiful Gothic church (1325-40). Pop. (1925) 21,565.

Pre-Raphaelitism. English art of the 18th century had in its genesis one national peculiarity. There being no demand for it from church or state, it had to find its patrons (i.e. its means of existence) in the wants of the people. Hogarth, the first distinctly national subject-painter, found his themes in the social manners of his day, which were valued by the true instinct of the common people. Portrait-painters of national origin there had been before his time, but these, good and bad alike, had been followers of foreign masters introduced by the court and supported by its patronage. That art other than architecture was not necessarily an exotic in England is proved convincingly by the many beautiful examples of monumental portraiture produced by native workmen before the Wars of the Roses. The bronze effigies of Henry III. and Queen Eleanor in Westminster Abbey were executed by William Torel, citizen of London, in 1291-92, and those of Richard II. and Queen Anne of Bohemia by Nicholas Broke and Godfrey Prest, coppersmiths and citizens of London, in 1395-97. Austin of London furnishes an excellent and later example of this in his monumental tomb in the Beauchamp Chapel, Warwick. Those wars, followed as they were by the Reformation and in quick succession by the parliamentary troubles, smothered native art and necessitated the calling in of foreign aid; for it must be remembered that under the happiest conditions a native artist cannot be produced in less time than a full generation.

Hogarth having once arisen with full daylight

of an independent inspiration, it was no longer possible for the mannered reproductions of the imitators of Kneller and Lely to satisfy the spirit of an age now awakened from its long sleep. Hogarth at first gained a footing by portraiture, and when later he devoted himself to subject-pictures he found a poor support by the sale of his engravings to the strictly middle classes. Amongst the wealthy there were two incentives to interest in art, one of these being found in ancestral dignity, the other in that love of sport so indelibly stamped upon English character. Sir Joshua Reynolds and Gainsborough arose, inspiring portraiture with their own precious grace and loveliness; animal-painters now well-nigh forgotten (such as Stubbs and his fellows) satisfied the latter; and Wilson as a landscape-painter made a heroic effort to graft upon the sportsman's instinct a larger love of nature. It has always been regarded as fortunate that at this time the reigning monarch, George III., declared his interest in the higher aims of art, an interest which expressed itself first in the establishment of the Royal Academy, and later in the patronage of Benjamin West for subjects of an exalted character. Although it is just that many of the works of this painter have since suffered a reversal of judgment, his picture of the 'Death of General Wolfe' will always remain a noble illustration of English history, largely justifying the king's favour. The great war for supremacy which at that time absorbed the nation's life, together with the almost ruinous debt then contracted, made further royal patronage impossible. It is easy now for any thoughtful person to trace how the high standard originally set was largely instrumental in sustaining the character of the art that followed. Its effects may be seen in the noble nature of the best works of Romney, Copley, Raeburn, Opie, Girtin, Blake, Lawrence, Stothard, Constable, Wilkie, Haydon, De Wint, Crome, Turner, Leslie, and not less in the decorative designs of houses by the Adams brothers, in Wedgwood ware, in gold and silver work, and in furniture.

It is rarely that any cause for rejoicing may be found in the disastrous war of the beginning of the 19th century, but undeniably it did great things for the strengthening of English character, and this was the case in no direction more surely than in that of art. When in the peace of 1814 the Continent was thrown open, it is noted by three great painters, Haydon, Leslie, and Constable, that England stands supreme in painting among the nations, and this verdict was endorsed by the judgment of many able foreigners. The selection of Sir Thomas Lawrence to paint the members of the Holy Alliance is a convincing proof of this opinion, and the recognition of Constable by France in 1820 is further evidence to the same effect. But alongside of virtuous influences there had been at work a deadly academic dogma which the few far-seeing of that generation recognised as threatening destruction to the still struggling English school, an influence which had already completely destroyed decorative design. To glance at the members' lists of exhibitions of that day and to recognise how many then held great are now perfectly unknown, brings this to the proof. These painters were creatures of orthodox rule, line, and system, seeing whose influence Constable in 1821 prophesied 'in thirty years English art will cease to exist.' Following up this forecast of the great landscape-painter, Leslie thirty years later finds the fulfilment of Constable's prediction in the death of Turner.

It remained for the young generation to find out what lay at the root of the decay and also its remedy. How to get free from the prejudice which blinds the eye to established errors is the prelim-

inary problem to effecting all reformation. The attempt made in Germany in the beginning of the century to cultivate what was called 'Early Christian Art,' was participated in by W. Dyce, D. Maclise, and a few other artists in England. But for youthful seekers after a perfect method these efforts, even where they expressed much of English individuality, were not unboundedly promising, because they lacked the full inspiration of nature. One of the earnest young students of the day was William Holman Hunt, who, already feeling his way as a practical painter, was led by circumstances to study in exceptional degree the works of the greatest old masters, and he perceived that in every school progress ended when the pupils derived their manner through dogmas evolved from artists' systems rather than from principles of design taught by nature herself. He determined therefore, for his own part, to disregard all the arbitrary rules in vogue in existing schools, and to seek his own road in art by that patient study of nature on which the great masters had founded their sweetness and strength of style. Without any idea of 'forming a school,' but for his own development alone, he began to study with exceptional care and frankness those features of nature which were generally slurred over as unworthy attention; and to this purpose he found most timely encouragement in the enthusiastic outburst of Ruskin's appeal to nature in all vital questions of art criticism, as expressed by him in *Modern Painters*.

At this period an increasing intimacy was cemented between W. Holman Hunt, aged nineteen, and John Everett Millais, who was already at the age of seventeen the precociously efficient medal student of the Royal Academy and an emulator of the pseudo-classical Etty. This youthful friendship led to frequent consultations over the needs of the growing generation of artists, and Millais declared his confidence in the closer study of nature, which he determined to adopt as soon as he was to which he was committed should be completed.

Dante Gabriel Rossetti was at this time also fascinated by the newly-revived principle of patient striving after nature, but he had not yet become a practical painter, and there was no certainty that he would do so. He had, before his intimacy with Holman Hunt, begun the study of art under Ford Madox Brown, a painter who had distinguished himself by some of the most admirable contributions to the Westminster Hall competition, works which Rossetti had the independent good sense to admire. In the year 1848 (when Holman Hunt was engaged on a picture of Rienzi, of which he had already completed the painting of the landscape from nature, and other complicated preparatory work) D. G. Rossetti placed himself with Holman Hunt in his studio in Cleveland Street, where he followed a course of study specially devised for him by the older student to enable him to cope with the difficulties of a picture undertaken in pure experiment, in which finally he triumphed; this picture is now well known as 'The Girlhood of the Virgin.'

Millais, on his part, forthwith took for his first subject to be treated on the new principles a design from Keats's *Isabella*. This was originally intended for one of a series of etchings which the three, now formed into a band called the Pre-Raphaelite Brotherhood, had undertaken to publish. It is the justly famous picture now in the Liverpool Art Gallery.

The three artists, as representing the Pre-Raphaelite body, appeared in the exhibition season of 1849, Millais with 'Lorenzo and Isabella,' Holman Hunt with 'Rienzi,' Rossetti with 'The Girlhood of the Virgin,' and excited the most flattering atten-

tion; but by the following year a storm of enmity of the most bitter kind was raised against them. Their pictures this second year were 'Christian Priests Escaping from Druid Persecution,' by Holman Hunt; 'Christ in the House of his Parents,' by Millais; Rossetti's picture of the 'Annunciation,' he exhibited (as he had done with his picture of the previous year) at another exhibition than the Academy. Many journals now joined the onslaught upon the three young artists, but undeniably the most damaging attack was one made by Charles Dickens in *Household Words*. (From this date to his life's end Rossetti discontinued public exhibition.) With this attack the bitter feeling against the young men so increased that in the following year (1851) one influential journal advocated that their pictures should be removed from the walls of the Royal Academy a few weeks after the opening of the exhibition. Thus, in the third year of its joint existence, the new school was threatened on all hands by powerful opponents, when there appeared in the *Times* three letters from Ruskin denouncing the spirit of jealousy and injustice with which the young men had been assailed. He pointed out the merits of the works and the great influence for good which the revival was likely to exercise upon the English school. Later followed a succession of pictures from the hands of the three young painters, works the titles of which have become familiar throughout England.

Among the works of Holman Hunt are 'Rienzi' (1849), 'Christian Priests Escaping from Druid Persecution' (1850), 'Two Gentlemen of Verona' (1851), 'Clandio and Isabella' (1853), 'Strayed Sheep' (1853), 'Light of the World' (1854), 'Seapagoat' (1856), 'Finding of Christ in the Temple' (1860), 'Isabella and the Pot of Basil' (1867), 'Christ the Carpenter' (1874), 'The Triumph of the Innocents' (1885). Amongst those of J. E. Millais are 'Isabella' (1849), 'Christ in the House of His Parents' (1850), 'Ferdinand lured by Ariel' (1850), 'The Huguenot' (1852), 'Ophelia' (1852), 'The Order of Release' (1853), 'L'Enfant du Régiment' (1855), 'Vale of Rest' (1859), 'Autumn Leaves' (1865), 'Chill October' (1870), 'A Flood' (1870). Amongst those of D. G. Rossetti are 'The Girlhood of Mary Virgin' (1849), 'The Triptych, Landaff Cathedral' (1856), 'Giotto painting the Portrait of Dante' (1859), 'Mary Magdalene at the Door of Simon the Pharisee' (1861), 'Beata Beatrix' (1865), 'The Blessed Damsel' (1877), 'La Donna della Finestra' (1879), 'The Day Dream' (1880), 'Dante's Dream' (1881), 'Found,' 'Proserpine' (1882). Many of these pictures exist in replica.

Rossetti makes reference to many of his pictures in his sonnets. The title Pre-Raphaelite was adopted not without some sarcastic spirit intending to reflect upon the use of the name of the prince of painters by artists of the day to justify their own flimsy and un-Raphaellesque art; but it had also a more serious justification in the conviction that Raphael's latest style, having been adopted, as that of an emulator, from the system built up with slow effort by Michael Angelo and Leonardo da Vinci, did not at last altogether escape those marks of decadence entirely unknown in the works of his immediate forefathers. This defect the seekers after the second Renaissance traced to the remoteness of Raphael from those influences of the training of humility which the study of nature had directly or indirectly given in full measure to Michael Angelo and Leonardo da Vinci. The first pictures of the new school had upon them, together with the initials of the painters, the letters P. R. B., meaning Pre-Raphaelite Brotherhood; when public hostility became highly injurious (the meaning of the letters having been revealed, contrary to the original intention) this practice was abandoned.

Besides the three working founders, some few friends were enrolled as hopeful converts, with the idea that they would assist the movement.

These were James Collinson and Thomas Woolner among artists, W. M. Rossetti, brother of the painter, and F. G. Stephens, who followed other professions than art. There can now be little question that the Pre-Raphaelite school has exercised a powerful influence upon modern art; whether it has done so to the extent hoped for by its promoters lies with the future to reveal. One ambition which it had from the beginning was the restoration of decorative art; this has been much retarded by the hindrances of opposing forces; still, a great movement, clearly traceable to the revival, has taken place. There is no question that many established painters of the time were beneficially affected by the new impulse, but still more was this the case for the men who followed them. Unfortunately for the school, its recognition came too late for it to profit by the temporary patronage of art extended by government in the decoration of the Houses of Parliament, for which all the commissions were bestowed before the Pre-Raphaelite school could claim attention; their work, therefore, has been confined to the limits of private patronage, which for the poetic and ambitious art they aimed at is too limited a sphere. Works of national importance are the only entirely appropriate field for the highest efforts.—W. H. H.

[With the above article by Holman Hunt, compare the same writer's work, *Pre-Raphaelitism and the Pre-Raphaelites* (1913); Sizieranne, *La Peinture Anglaise Contemporaine* (trans. 1898); Destroë, *Les Préraphaélites* (1894); Bate, *The English Pre-Raphaelite Painters* (1899); also the articles in this work on ROMANTICISM, and on ROSSETTI, MILLAIS, HOLMAN HUNT, and the other artists mentioned.—ED.]

Prerogative, ROYAL. See DIVINE RIGHT, PARLIAMENT, SOVEREIGN, PARDON, REPRIEVE.

Prerogative Court, in England, was the court wherein all wills were proved and administrations taken out. It was so called because it belonged to the prerogative of the archbishop to take charge of these matters, which formerly fell under ecclesiastical superintendence. Hence there was a Prerogative Court for the province of Canterbury and another for the province of York. This jurisdiction was entirely taken away in 1858 from the ecclesiastics, and transferred to a new court called the Probate Court (q.v.).

Pressburg (Ger. *Pressburg*, Czech *Bratislava*, Hung. *Pozsony*), a town of Czechoslovakia, stands on the left bank of the Danube, 40 miles by rail E. by S. of Vienna and close to the Austrian and Hungarian frontiers. It is backed by the spurs of the Little Carpathians, and is a pleasant town. Its principal buildings are the cathedral, a Gothic edifice of the 13th century (restored in the middle of the 19th), in which the kings of Hungary used to be crowned; the church of the Franciscans (1290-97); the town house (1288), with a natural history collection; the parliament house, in which the Hungarian representatives used to meet until 1848; and some private houses. The royal castle (1645) was destroyed by fire in 1811, and is now a ruin. The university was founded in 1919 to take the place of the Hungarian university of 1914. Pressburg's position on the Danube (with a new harbour), and on a network of canals and railways, favours its development as a centre of international trade. Pop. 93,000. Pressburg grew to be a prominent town during the 11th and 12th centuries, and was frequently chosen for conferences and meetings between the rulers of Austria and Hungary. From 1541 (when the Turks seized Buda) down to 1784 it was the capital of Hungary. The town was taken by Bethlen Gabor in 1619, by the Austrians in 1621, and was bombarded by Davout in 1809. Here on 26th December 1805

Napoleon concluded a treaty with the emperor after the battle of Austerlitz.

Presbyopia (Gr., 'old sight'), a change in the power of vision, not usually noticed till about forty-five years of age, when near objects come to be less distinctly seen than those at a distance. See EYE.

Presbyterianism. The name Presbyter is from the Greek *presbyteros*, 'elder.' The elders formed one division of the great council of the Jews, with the priests and scribes (Mark, xiv. 43); and every synagogue had its body of ruling elders (Luke, vii. 3, viii. 41). From these the name and some portion of the duties were transferred to the Christian church. We have no record of the first appointment of elders, but we find them as recognised rulers in the church of Jerusalem so early as the year 44 (Acts, xi. 30). The duties entrusted to them are these: (1) They had charge of the collections for the poor which were sent by the hands of Barnabas and Saul (Acts, xi. 30). (2) They are specially named as taking part in the council which was held at Jerusalem about the year 51 (Acts, xv. 2), and at the meeting of the church there when Paul reported his success among the Gentiles (Acts, xxi. 18). (3) They took part in the ordination of Timothy (1 Tim. iv. 14). (4) They were the pastors and bishops of the congregations. Thus the apostle Paul, addressing the elders of Ephesus, says, 'Take heed . . . to all the flock over which the Holy Ghost hath made you overseers (bishops) to feed the church of God' (Acts, xx. 28). And writing to Timothy, he says, 'Let the elders that rule well be counted worthy of double honour, especially they who labour in word and doctrine' (1 Tim. v. 17). Elders also are found in all the churches. We have seen them in the mother-church of Jerusalem; and when Paul and Barnabas went forth on their first missionary journey, about the year 46, they ordained elders in every church (Acts, xiv. 23). Accordingly we find them in Ephesus about the year 60 (Acts, xx. 17), and in the same city a few years later (1 Tim. v. 17, with chap. i. 3), and in Crete. Titus is commanded 'to ordain elders in every city' (Tit. i. 5). These are the scripture facts on which the system of Presbyterianism as a government by elders is based. It does not recognise the bishop as the superior of the presbyter, for they were originally two names of the same persons. Thus in Titus, i. 5, 7, the apostle writes, 'Ordain elders in every city . . . for a bishop must be blameless,' and in Acts xx. those who in verse 17 are termed elders in verse 28 are termed bishops. On the original identity of the bishop and presbyter Bishop Lightfoot says, 'It is a fact now generally recognised by theologians of all shades of opinion, that in the language of the New Testament the same officer in the church is called indifferently bishop (*episkopos*) and presbyter.' There are two instances in which the term 'bishop' occurs apart from his being described as 'elder,' just as there are many examples of the elder being mentioned without his being termed bishop (Phil. i. 1; 1 Tim. iii. 2). In the writings of Clement of Rome, about the end of the 1st century, there is the same identity between the elder and the bishop; but from this period onwards the distinction between the two begins to appear, though Jerome in the 4th century writes: 'Among the ancients bishop and presbyter are the same, for the one is a term of dignity, the other of age.' See the articles BISHOP, CHURCH HISTORY, ORDERS (HOLY).

It used to be claimed that Presbyterianism survived in the ancient Celtic Church; but the Celtic polity, though differing widely from diocesan Episcopacy, was very unlike Presbyterianism (see

IRELAND, SCOTLAND, COLUMBA, CULDEES). The Waldenses (q.v.) were perhaps anti-episcopal. But Presbyterianism as we know it first asserted itself at or after the Reformation, when earnest attempts were everywhere made to restore to the church primitive doctrine and form. In Germany, France, and the Continent, from the relationship of church and state, its free development was prevented (see CONSISTORY). It was Calvin (q.v.) in Geneva who, though not its originator, gave Presbyterianism the form which, with modifications, it has ever since retained. It occupies a middle position between diocesan Episcopacy and Congregationalism, and may be styled ecclesiastical republicanism. The congregation elects its own minister and elders, and by deacons or managers regulates all its financial affairs. The session, consisting of the minister and elders, has the spiritual oversight of the congregation. The ministers, with one or more elders from each congregation, constitute the presbytery (formerly sometimes called *classis*) of a defined district, having a general superintendence of the congregations; to it appeal may be made from congregations or sessions. Some churches still retain as part of the regular organisation the synod, consisting of a number of presbyteries in a province, and a court of appeal from presbyteries; other churches dispense with this intermediate court. The General Assembly or General Synod is the highest court, and consists of all the presbyteries or their representatives.

Presbyterianism was for a short time dominant in England, but is now most fully represented in Scotland, the north of Ireland, the British Dominions, and the United States. 'The alliance of the Reformed Churches holding the Presbyterian System' was founded at London in 1875, and has held 'Pan-Presbyterian' councils in different parts of the world, meeting every four years, with the exception of the war-period 1914-18. All churches are eligible 'having a creed in harmony with the consensus of the Reformed Confessions.'

England.—The principles of the Puritans (q.v.) were essentially Presbyterian, although many of them were so much occupied with questions of doctrine and discipline, and with resistance to power exercised, as they believed, contrary to the word of God, that they paid little heed to the development of their principles in church government. Yet in 1572 a presbytery was formed at Wandsworth, in Surrey, by ministers of London and its neighbourhood, separating from the Church of England; and other presbyteries were soon formed, notwithstanding the extreme hostility of Queen Elizabeth. When the Westminster Assembly met in 1643 the Puritans of England were generally inclined to adopt Presbyterianism as their system of church government, although some still preferred a modified Episcopacy, and some had adopted the principles of Independence or Congregationalism. The Presbyterians were, however, the strongest party at the beginning of the Civil War, although the Independents gained the ascendancy afterwards. The establishment of Presbyterian church government in the Church of England was voted by parliament (the Long Parliament), 13th October 1647; but it was never really established. The influence of the Independents prevented it. London and its neighbourhood were, meanwhile, formed into twelve presbyteries, constituting the Provincial Synod of London, which continued to hold regular half-yearly meetings till 1655, the meetings of presbyteries being continued till a later date; but the whole Presbyterian system was overturned by Cromwell's Committee of Triers, appointed for the examining and approving of all persons elected or nominated to any ecclesiastical office. Cromwell's policy aimed at bringing all ecclesiastical matters

under the immediate control of the civil power. The Restoration was followed by the fruitless Savoy Conference (q.v.), and soon after by the Act of Uniformity, which came into force on 24th August 1662; and on that day about 2000 ministers in England and Wales resigned their benefices, or submitted to be ejected from them, for conscience' sake. The first Nonconformists were mostly Presbyterians, but a small minority of Independents among them prevented the institution of a regular Presbyterian system, and the consequence was that the Nonconformists of England became in general practically Independent. Antinomianism and Arminianism soon appeared among them, and were followed by Socinianism or Unitarianism to such an extent that the name *Presbyterian* became synonymous in England with *Socinian* or *Unitarian*; old endowments, legacies of Presbyterians, being in many instances enjoyed by Unitarians. Meanwhile, there sprang up in England a few congregations connected with the Church of Scotland, and with the 'Secession Church' (see UNITED PRESBYTERIAN CHURCH). The number of such afterwards very much increased. At the time of the formation of the Free Church of Scotland (q.v.) the greater number of the English Presbyterian churches connected with the Church of Scotland sympathised with the cause of the Free Church, and took the name of the Presbyterian Church in England. In 1876 a union, which had been long desired, was consummated between the synod more intimately related to the Free Church of Scotland and the congregations belonging to the United Presbyterian Church. The name assumed by the united church is the Presbyterian Church of England, which in 1925 had over 85,000 adherents and 360 ministers.

Scotland.—The Presbyterian Churches of Scotland are separately treated in the articles SCOTLAND (CHURCH OF), FREE CHURCH OF SCOTLAND, UNITED PRESBYTERIAN CHURCH, UNITED FREE CHURCH, and CAMERONIANS. The most important are the Church of Scotland with over 1800 ministers and 760,000 communicants, and the United Free Church with over 1600 ministers and 535,000 communicants. Since 1907 negotiations for union between these two churches have been on foot.

Ireland.—The Irish Presbyterian Church originated in the settlement of Ulster by Scottish colonists during the reign of James I. After various struggles a Presbyterian church was founded by the formation of a presbytery at Carrickfergus in 1642. The Presbyterian population of Ulster was greatly increased in number by immigration from Scotland about the middle of the 17th century; and, notwithstanding many difficulties, from the opposition of prelates and of the civil power, the church continued to increase. It is a curious fact that the Presbyterian ministers received a pension from government, under Charles II., in 1672, which *Regium Donum* (q.v.), however, was not regularly paid until the reign of William, when it was augmented, although only to the paltry amount in all of £1200 a year. It was afterwards repeatedly augmented, till it reached the amount of £70 for each minister. A seminary for the education of ministers was erected at Killaleagh; and in 1710 the synod of the Presbyterian Church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history the Irish Presbyterian Church experienced the utmost opposition from the High Church party. Afterwards dissensions sprang up within it, and these with reference to the most important doctrines. A body opposed to the doctrine of the Westminster Confession of Faith was organised as the Presbytery of Antrim. But the doctrine of the Westminster Confession was more and more

departed from the Irish Presbyterian Church itself, which became to a large extent Arian or Unitarian. In 1830 a separation took place from the Arians, who then formed the *Remonstrant Presbytery of Ulster*. In 1840 a union took place of the Irish Presbyterian Church forming the *Synod of the Ulster and Secession Church of Ireland*, an offshoot of the Scottish Secession Church, which then reckoned 141 congregations in the north of Ireland. The Irish Presbyterian Church, adhering to the Westminster Confession, has not only displayed much zeal for the advancement of Protestantism in Ireland, but also of Christianity in other parts of the world. The act disestablishing the Irish Church in 1869 provided also for the discontinuance of the *Regium Donum* to the Presbyterians, with reservation of annuities for life to ministers already entitled to it; and further gave power for commutation of annuities for a capital sum, of which advantage was taken to a very large extent, so that a fund was formed for paying annuities and leaving a large surplus as the nucleus of a Sustentation Fund for the ministers. The Presbyterian Church in Ireland comprises about 600 ministers and 109,500 communicants.

United States.—The first Presbyterians in America were emigrants from Scotland and Ireland. The first Presbyterian congregations in America were organised in Maryland before the close of the 17th century—the oldest that of Ichaboth, dating about 1690, and a synod, consisting of four presbyteries, was constituted in 1716. Dissensions ensued; but in 1758 the American Presbyterian churches were united in one; and in 1788 a General Assembly was instituted, the whole number of congregations being then 419, and of ministers 188. The increase of the church was rapid, and in 1801 a scheme of union was adopted between Presbyterians and Congregationalists, under which hundreds of congregations were formed in the state of New York and elsewhere. About the beginning of the 19th century the Cumberland Presbyterians (q.v.) separated from the main body; and in 1838 the American Presbyterian Church was divided into two great sections, commonly known as *Old School* and *New School* Presbyterians, the former holding high Calvinistic doctrines, the latter a somewhat modified Calvinism. They re-united in 1869, notwithstanding the dissensions and new divisions caused by the struggles between the Northern and Southern States on the question of slavery, forming the Presbyterian Church in the United States of America. The Southern sections had meanwhile formed the Presbyterian Church in the United States. One half of the Cumberland Presbyterians united with the former in 1906, the other half remaining independent. A revision of the Confession has been carried out since 1890. There are several other Presbyterian churches in the United States, each having its own theological seminaries and colleges, such as the Reformed, the United Presbyterian, the Reformed Dutch and German. In 1923 there were more than 15,000 Presbyterian churches altogether with two and a half million members.

British Dominions.—By the middle of the 18th century Presbyterian ministers were labouring in Nova Scotia and Quebec, the various divisions of the home churches being represented at an early stage; but most of the early ministers came from the Secession Church. A union between the sections representing the Free and United Presbyterian Churches took place in 1861, and in 1925 a union between the Canadian Presbyterian, Methodist, and Congregational Churches (though this union left behind about 150,000 dissidents, who decided to continue as the Presbyterian

Church of Canada). Presbyterians in Canada number altogether about 1,400,000, and in Australia, New Zealand, and South Africa about 660,000, 300,000, and 190,000 respectively. See the articles on the various dominions.

On Presbyterianism, as against Episcopacy and Independence, see, in the 17th century, works by Gillespie, Rutherford, Bailie, "Smectynunus," Byfield, Baxter, Clarkson; in the 18th, Welles, Hall, John Brown, Whyte; in the 19th, Barnes (1835, 1840, 1843), Miller (1842), Smyth (1843), and King (1854); also Macpherson, *Presbyterianism* (1883); Lammiman, *Worship of the Presbyterian Church* (1884); Janet G. Macgregor, *The Scottish Presbyterian Polity* (1926); histories by W. Stephen (1894-96) and J. Macpherson (1901); W. M. Macphail, *The Presbyterian Church* (1908); Lord Balfour of Burleigh, *Historical Account of Presbyterianism in Scotland* (1911); J. N. Ogilvie, *Presbyterian Churches of Christendom* (1925). See also CALVIN, KNOX, ASSEMBLY (GENERAL), ELDER, CHURCH HISTORY, REFORMATION, CONFESSIONS, WESTMINSTER ASSEMBLY. For Presbyterian missions, see MISSIONS. For Presbyterianism in England, see Madrie, *Annals of English Presbyterianism* (1872); Drysdale's *History of the Presbyterians in England* (1889); W. A. Shaw, *The English Church during the Civil War* (1900); K. M. Black, *The Scots Churches in England* (1906). For Ireland, see IRELAND; also Reid, *History of the Presbyterian Church in Ireland* (1867); Irwin, *Irish Presbyterianism* (1890). For America, see Webster, *History of the Presbyterian Churches in America* (1857); Gillett, *History of the Presbyterian Church in the United States* (1864); *American Presbyterianism* (1885).

Presbytery. For presbytery as a part of Presbyterian church government, see the preceding article. In ecclesiastical architecture the presbytery is the space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir.

Prescot, a manufacturing town of Lancashire, 8 miles E. by N. of Liverpool. To manufactures (introduced from Yorkshire in 1730) of watch-movements, watch-tools, small files, &c., have been added the making of electric cables, bookbinding, and printing. Prescot was the birthplace of John Kemble. Pop. 9900.

Prescott, a city of Arizona, till 1891 the capital, lies in a picturesque mountain-valley, some 5000 feet above sea-level, 80 miles N. by W. of Phoenix. Gold, copper, and silver are extensively mined. The industries include stock-raising, lumbering, and irrigation farming. Pop. 5000.

Prescott, WILLIAM HICKLING, historian, was born at Salem, Massachusetts, May 4, 1796. His father was a prosperous lawyer; his grandfather, Colonel William Prescott (1726-95), was a distinguished soldier in the Revolution, to whose memory a statue was erected on Bunker Hill in 1881. He entered Harvard College in 1811, and graduated in 1814. Early in his college course he had his left eye blinded by a piece of bread playfully thrown by a fellow-student, and the other was soon sympathetically affected, so that he was obliged to live for months in a darkened room. He next travelled in England, France, and Italy, married in 1820, and abandoned the study of law for literature. He now devoted himself to severe study, and formed splendid literary projects, in spite of the grievous disadvantage of being able only to use his remaining eye for brief periods. His first studies were in Italian literature, and it was not till the beginning of 1826 that he had found the work of his life within the range of Spanish history. Fortunately his means were ample, so that he was able to procure the services of assistants, and to live amid conditions of comfort. By constant habit he gained the power of carrying a great deal in his memory, and after he had revolved the whole of a chapter in his mind he quickly transferred it to paper by means of his

stylus and an ingenious writing-case specially constructed for the blind. His first secretary knew no Spanish, yet he went through the seven quarto volumes of Mariana's History with him. So he laboured with almost unexampled courage and patience at his *History of Ferdinand and Isabella* (3 vols. Boston, 1838), which quickly carried his name across the ocean to the Old World, and was straightway translated into French, Spanish, and German. He next devoted six years to the *History of the Conquest of Mexico* (3 vols. 1843), and four years to the *Conquest of Peru* (2 vols. 1847). These works deservedly brought him a great reputation; he was chosen a corresponding member of the French Institute, and on a visit to Europe in 1855 was received with the highest distinction. In 1850 he published two volumes of his *History of Philip II.*, and a third volume in 1858, but died of apoplexy before its close at Boston, January 28, 1859. Prescott's style alone would have assured him popularity, and to this day he remains unrivalled among English historians for vigorous and direct narrative and for sustained splendour of colour. His imagination worked all the more freely because he saw but with the inward eye, and the splendid visions that it wove gave his pages the vivid colours of reality and life. He is not a philosophical historian, but he is a master of narrative and incident, and there is not a dull passage in all his histories.

See the complete edition of Prescott's works in 22 volumes, ed. Munro (1904); and the Life of him by George Ticknor (1864; new ed. Lond. 1876). There are also books by Ogden (1906) and Peck (1906).

Prescription is the written direction given by physician or surgeon to the chemist, and may demand an official or an extemporaneous compound. Official compounds (or preparations, as they are frequently termed) are those for which formulae are introduced into the national pharmacopœias, and are therefore supposed to be always at hand in the laboratory of the dispensing chemist (such, for example, as *Mistura Ferri Composita*, *Utrius Ipecacuanhæ Compositus*—i.e. Dover's Powder—*Confectio Sulphuris*, &c.); while extemporaneous compounds are those which are devised on the instant with the view of meeting the various peculiarities which almost every case of disease presents. In some cases, where no chemical action is apparent or probable, a mixture of two or more drugs seems to modify the physiological effect of each ingredient. For example, Dover's Powder contains as its active ingredients ipecacuanha and opium, and yet in well regulated doses it neither exhibits the nauseating properties of the former nor the narcotic influence of the latter substance. The selection of the most eligible form of the remedy is of extreme importance. The physician here has to determine whether he shall prescribe his remedy in the form of pill, powder, or mixture; whether he shall administer it as an injection into the lower bowel; whether the patient shall (in certain cases) inhale it; &c. As a general rule we should accommodate the form and flavour of our remedies, provided we do not sacrifice their virtues, to the taste of the patient, who usually prefers pills to draughts or powders. The unpleasant taste of many medicines which must be given in the fluid form may often be obviated by the skill of the prescriber. Castor-oil, cod-liver oil, and copaiba are most easily taken on the surface of orange-wine, or water containing a bitter tincture. The taste of solution of potash and of lime-water is best covered with milk. Unpleasant drugs are now frequently given either in gelatine capsules or in rice-paper cachets, which dissolve in the stomach; and small powders are often for convenience compressed into the form of tablets.

In conclusion it may be remarked that it is the custom to write prescriptions in the Latin language, to abbreviate well-known words, and to use symbols for weights and measures, and to commence each prescription with the symbol \mathcal{R} , which signifies *Recipe*, 'take.' As an illustration, we append a prescription for a tonic draught (where $f. \mathfrak{z}$ stands for fluid ounce; $f. \mathfrak{z}$ for fluid drachm; \mathfrak{m} for minim; $gr.$ for grain; $M.$ for *misce*, 'mix'):

(Name of Patient.)

\mathcal{R} Quinin. Sulph.,	$gr. \frac{j}{2}$
Tinct. Calumbæ,	$f. \mathfrak{z}$
Acid. Sulphuric Dil.,	\mathfrak{m}
Syrup. Aurant.,	$f. \mathfrak{z}$ iss
Infus. Calumbæ,	ad $f. \mathfrak{z}$

$M.$ *Fiat Haustus ter quotidie sumendus.*

Date. (Initials or name of prescriber.)

As a parallel to this retention in western Europe of a mediæval usage, it may be mentioned that in the palmy days of the republic of Athens the Attic-speaking practitioner was held bound to write his prescriptions in the ancient Doric dialect; the reason in this case being that the schools of medicine in the Doric colonies of Magna Græcia and elsewhere were long the most celebrated.

Prescription, in Roman law, means a clause inserted in the preface to the formula under which an action was tried. The prescription *longi temporis* directed that the claimant should not succeed if the defendant had been so long in possession of the property in dispute that equity would not allow him to be disturbed. In England lapse of time may affect property rights in various ways. The right of a claimant to bring an action may be taken away by statutes of Limitation (q.v.), or the law may regard the long enjoyment of the possessor as evidence to show that his rights had a lawful origin. Possessory title to land is now gained under the express provisions of the modern statutes of limitation. In proving title by prescription to easements (such as rights of way, ancient lights, &c.) and other incorporated rights over the land of another the claimant relies on immemorial enjoyment; but the courts would always infer the immemorial character of the right from a comparatively short period of actual enjoyment. And now, under the Prescription Act of 1832, the period is fixed at twenty years in the case of lights and other easements and thirty years in the case of profits (such as common of pasture, and the like). For the rules of the act, see Shelford's *Real Property Statutes*.

In the law of Scotland prescription is a method both of acquiring and of losing a right; hence it is divided into positive and negative. The positive prescription was introduced by Statute 1617, chap. 12. As that statute has been interpreted by decisions, possession of heritable subjects for forty years, on the requisite titles, recorded in the appropriate register is sufficient to secure an owner against any one alleging a better title; or to determine the extent of an estate, where a question arises either as to what is comprehended under a general description or as to whether a specific piece of property has been carried under a clause of parts and pertinents; or to merge a title of property in the higher title of superiority. The possession must be uninterrupted and co-extensive with the right claimed. The Conveyancing (Scotland) Act, 1924 (14 and 15 George V., chap. 27), sect. 16, following upon an Act of 1874, simplifies the title necessary for founding prescription, by enacting that 'any *æ facie* valid, irredeemable title,' recorded in the appropriate register, shall be sufficient; and shortens the prescriptive period by enacting that possession

for twenty years continually and together, following on such recorded title, shall be equivalent to possession for the old period of forty years.

The negative prescription of obligations was first introduced by the Statute 1469, chap. 29, which declares that unless a person follow an obligation and take document thereon within forty years, his right shall prescribe and be of no avail. By the Act 1617, chap. 12, this prescription was extended to heritable bonds and other heritable rights, and it was enacted that the years of minority of the party against whom the prescription was used should not be counted. The Conveyancing (Scotland) Act, 1924, (sect. 17), shortened the prospective period from forty to twenty years. For several shorter prescriptions, see DEBT. In Scotland if, within twenty years after the commission of a crime, no step has been taken to bring the offender to justice, it would appear that the right to prosecute falls to the ground.

Presentment. See CRIMINAL LAW.

Preserved Provisions. Under the term *preserves* is usually included fruit, either whole or broken, or the juice of fruit, preserved by boiling with sugar. Whole fruit is boiled in clear syrup in such a manner that the sugar penetrates the fruit completely. It is then drained and dried at a gentle heat, so that the absorbed sugar crystallises in the substance and on the surface of the fruit, which is then known as *candied*. Jam consists of fruit boiled with an equal weight of sugar, which latter dissolves in the fruit juice set free as the fruit breaks down. If well made they can be preserved in this manner for years, but the quality deteriorates after twelve or eighteen months, owing to crystallisation and other changes taking place in the sugar. Fruit jellies consist of the juice of the fruit only, boiled with sugar, this vegetable jelly consisting principally of a substance known to chemists under the name of *pectin*. Fruits are also preserved by covering with water in suitable vessels, heating to a high temperature, and closing the vessel whilst hot.

Meat, vegetables, and other provisions may be preserved with more or less success in a number of ways, which may be classed roughly under four headings: (1) desiccation; (2) use of cold; (3) by chemical compounds (antiseptics); (4) by exclusion of air. The simple process of drying is effective both with meat and vegetables, and if completely carried out prevents the ordinary putrefactive changes from taking place. Dried vegetables are prepared largely for use on board ship, and the soup tablets so extensively used nowadays consist of meat and vegetables dried and pressed together. Jerked Beef (q.v.) and Pemmican (q.v.) are prepared chiefly by drying in the sun. The use of cold is mainly a temporary expedient employed for the carriage of meat from one country to another. This industry is carried on extensively in America, Australia, and New Zealand. The carcass is frozen hard by a refrigerating machine, and packed on board ship in a chamber cooled by a similar apparatus. Meat so preserved arrives in Europe in good condition, and if properly thawed is superior to all but the best home-grown beef and mutton (see REFRIGERATION). For condensed milk, see MILK.

Certain chemical substances have the power to prevent decay or arrest putrefactive changes by destroying the activity of the germs or ferments which act as the exciting cause. Common salt is variously applied for the purpose of preserving meat (the food-value being thereby somewhat decreased); the meat may be immersed in brine, packed in salt, rubbed with salt and dried, or salted and smoked. The method of salting and

smoking ham is described at HAM; the chief preservative element in the wood-smoke is creasote. Creasote, boric acid, salicylic acid, and sulphur compounds are all substances that can be used as food preservatives, but the objection to the use of chemical agents is that they either have a distinct taste themselves or have a toxic influence on the human body. Salicylic acid has been used in large quantities for preserving milk and other foods, but, when taken even in small doses for a lengthened period, it disturbs the animal economy; and in France any food preserved by its means is now condemned as unfit for human consumption. The use of creasote is confined to meats which are usually smoked. Boric acid has no taste, but it is a moot point whether it is harmless or otherwise—under the Food and Drugs Act its use is forbidden in any article of food likely to be used by children or invalids. Milk, fish, poultry, and meat of all kinds may be preserved for months by its use. Some sulphur compounds, notably the bisulphite of lime and sulphurous acid, are good preservatives, but they have an objectionable taste. The former is used by butchers as a preserver of meat in hot weather.

Exclusion of air is a method of preserving which is used almost exclusively for cooked foods. Various plans of coating meat with air-tight coating have been tried, but they have been carried little further than the experimental stage. Meat has been dipped in molten paraffin-wax, gelatine, gutta-percha, &c.—all of which exclude air: but the air, or, more correctly, the germs present in the air, are imprisoned in the tissues of the meat, and these speedily set up putrefactive changes. The only process which has successfully accomplished the desired end is by the use of high temperature to expel the air and destroy the germs, and then sealing to prevent ingress of more air. Many have claimed the credit of this invention, but in all probability it was first proposed by one Appert of Paris in 1810. The process as now carried on, however, is the outcome of many minds, Appert's original method simply supplying the groundwork. The various tinned meats, soups, &c. now in the market are examples of this method of preserving food. The meat, &c. is placed in tins, which are immersed in a solution of calcium chloride heated up to a temperature of 270° F., which destroys both germs and spores. The tins are previously closed, except a small pin hole for the escape of steam. They are heated thus for about three hours, when the pin-holes are closed by solder, and the tins are allowed to cool. This process is thoroughly successful as far as mere preservation goes. Tins of meat thus treated have been opened after twenty years, and no sign of putrefaction has been noted; occasionally through some carelessness the air may not have been thoroughly removed and putrefaction ensues; such exceptions, however, are rarely met with in tins sent out by good firms. A bad tin can be detected before opening by the bulged-out appearance of the tin, the gases of decomposition pressing out the sides or ends. The objection to the process lies in the over-cooking to which the meat must be subjected. This impairs both the appearance and flavour, and no doubt removes some of the nutritive value of the meat, although this latter point is denied by some. Other plans, varying somewhat in detail but similar in principle, have been patented, and are in use in some of the food-preserving factories. Aberdeen and London are centres for this industry, the former having five factories, whilst in America and New Zealand (q.v.) a large amount of capital is invested in the trade. See SALMON.

The various extracts of meat are in a way preserved foods. They consist of the juice and

extractive matter of the meat evaporated down to a thick consistence, and frequently preserved by a large addition of salt. The majority of these extracts are stimulants rather than foods, some of them being practically useless. Vegetables are frequently preserved by the process of pickling. The vegetables are boiled with vinegar and spices. The latter two substances, being antiseptic in their nature, prevent putrefaction and decay.

President of the United States, the head of the executive of the United States, is also the only executive officer who reaches his position by election; the appointment of the others being either in his hands (subject to their confirmation by the senate) or regulated by law. The president is elected for a term of four years; several presidents have been chosen for a second term of office, but a third term, although there is nothing in the constitution to prevent it, is practically prohibited by the popular prejudice against it. A candidate must be a natural-born citizen of the United States, not under thirty-five years of age. The president has a salary of \$75,000 a year, and must receive no other emolument during office from the United States or any State. He is commander-in-chief of the army and navy of the United States, and of the militia when in the actual service of the Union; he has the power to grant reprieves and pardons for offences against the United States, except in cases of impeachment, and (by and with the advice and consent of two-thirds of the senate) to make treaties and to appoint ambassadors, consuls, and all other officers of the United States whose appointments are not otherwise provided for; from time to time he sends to congress a 'message' (cf. the 'King's Speech') giving information as to the state of the Union, and recommending measures for consideration; he may convene both houses, or either house, in special session; and, if the two houses disagree as to the time of adjournment, he may adjourn them to such time as he thinks fit. The president, like the vice-president and all other civil officers, may be removed from office on impeachment by the House of Representatives for and conviction by two-thirds of the senate of treason, bribery, or other high crimes and misdemeanours. He may require the opinion, in writing, of the head of any of the executive departments on any subject relating to the duties of his department. Every bill which passes congress must have the president's signature to become law, unless, after he has returned it with his objections, two-thirds of each house support it and pass it over his veto.

The Vice-president of the United States, although elected along with the president, is no part of the executive department. His sole function is to preside over the senate, where he has no vote unless in the case of a tie; and in practice he has little influence on the administration, and is regarded only as an 'under-study,' in readiness to take the presidency in the event of its being vacated by the president's removal, death, resignation, or inability. Six vice-presidents—Tyler, Fillmore, Johnson, Arthur, Roosevelt, Coolidge—have so succeeded to the presidency. In the event of the removal, death, resignation, or inability of both the president and the vice-president, the secretary of state, and after him, in their order, other members of the cabinet, would act as president until the disability of the president was removed, or a new president elected. On the death of a vice-president the duties of his office are fulfilled by the president *pro tempore* of the senate.

The election of president and vice-president is controlled by the electoral system, under which the people do not vote directly for the candidates, but for electors from their separate states who are

pledged to cast their votes for particular candidates. Each state is entitled to a number of electors equal to its number of senators (two in each case) and representatives in congress; these latter range from one to forty-three. At first the electors simply voted for two candidates, and the one who received the second highest number of votes for president became vice-president; but since 1804 provision has been made for a separate election of the vice-president. In the event of no candidate having a majority of the electoral votes the House of Representatives chooses a president, voting by states, each state having one vote; if no vice-president is elected the senate chooses a vice-president, voting as usual. Such cases occurred in 1800-1, when Jefferson and Burr had tied, and the former was made president and the latter vice-president; in 1824-25, when none of the four candidates for the presidency had a majority, and John Q. Adams, who had received eighty-four electoral votes, was chosen by the House over Andrew Jackson, who had ninety-nine; and finally in 1836-37, when Richard M. Johnson, who had obtained a plurality of electoral votes for the vice-presidency, was elected by the senate. The territories have no vote in any case.

For other presidents, see the articles on the several republics that have such officers at the head of the government.

The presidents of the United States have been George Washington (1789-97), John Adams (1797-1801), Thomas Jefferson (1801-9), James Madison (1809-17), James Monroe (1817-25), John Quincy Adams (1825-29), Andrew Jackson (1829-37), Martin Van Buren (1837-41), William Henry Harrison (March April 1841), John Tyler (1841-45), James Knox Polk (1845-49), Zachary Taylor (1849-50), Millard Fillmore (1850-53), Franklin Pierce (1853-57), James Buchanan (1857-61), Abraham Lincoln (1861-65), Andrew Johnson (1865-69), Ulysses S. Grant (1869-77), Rutherford B. Hayes (1877-81), James Abram Garfield (March September 1881), Chester Alan Arthur (1881-85), Grover Cleveland (1885-89), Benjamin Harrison (1889-93), Cleveland (1893-97), William McKinley (1897-1901), Theodore Roosevelt (1901-9), William Howard Taft (1909-13), Woodrow Wilson (1913-21), Warren G. Harding (1921-23), Calvin Coolidge.

Presidio, a Spanish word for 'a fort,' applied especially to four Spanish fortified posts on the coast of Morocco—Ceuta, Melilla, Alhucemas, and Peñón de Vélez, formerly convict settlements.

Press, FREEDOM OF THE, the expression used to denote the absence of any official restraint on the publication of books and other printed matter. In England, at the Reformation, the control of the press came to be centred in the crown, the ecclesiastical in addition to the secular government being vested in Henry VIII. as temporal head of the church. The Company of Stationers, who came to have the regulation of printing and publishing, were servants of the government, subject to the control of the Star Chamber. The censorship of the press was enforced by the Long Parliament, in spite of Milton's eloquent protest (see his *Areopagitica*), and was re-established more rigorously at the Restoration. It was continued at the Revolution, and the statute regulating it was renewed from time to time; but at last in 1695 the Commons by a special vote struck it out of the list of temporary acts to be continued. Since that time the censorship of the press has ceased to exist in Britain. But, though there are no official restrictions on what shall and what shall not be published, the authors and publishers of criminal or injurious matter are amenable to the law of libel; and there are certain statutory requirements in force to enable them to be traced. Every person who prints anything for hire or reward must,

under a penalty of £20, keep one copy at least of the matter printed, and write on it the name and place of abode of the person who employed him to print it. Every person who prints any paper meant to be published must print on the first or last leaf his name and usual place of business; and on failure to do so he forfeits the sum of £5, and so does any person publishing the same. There are a few printed papers exempted from conforming to the above requirement—as, for instance, papers printed by parliament or in government offices, engravings, auction lists, bank-notes, bills of lading, receipts for money, and a few other similar matters. In the case of a libel legal publication is constituted by sending or showing a copy printed or in manuscript to any person; the sale of a newspaper or other publication in a shop, or its delivery to an officer at the Stamp-office, is also considered an act of publication. The truth of the statements published may be urged as a plea of defence in an action for libel; in criminal proceedings truth is a defence if the publication is for the public benefit. The publisher of a book or newspaper may also defend himself by showing that the matter complained of was published by order of either House of Parliament, that it is a fair criticism on a public person or act, or that it represents the honest belief of the defendant, and is published by him in the course of his official or moral duty. If a bill shall be filed in any court for the discovery of the name of the printer, publisher, or proprietor of a newspaper or other publication, with the view of rendering him liable in damages for slanderous matter, the defendant is bound to make the discovery required, which, however, cannot be made use of against him in any other proceeding than that for which it has been made. The penalties against newspapers can only be sued for in the name of the Attorney-general or Solicitor-general, or Lord Advocate. Certain regulations also exist regarding the exhibition of Plays (q.v.). Subject to these restrictions, the freedom of the press has subsisted in Britain since 1693-95. At least an equal degree of freedom obtains in the United States, where privilege is much more widely extended. See LIBEL.

A more or less rigorous censorship of the press exists in most European states. There is often no direct supervision previous to publication, but the censor has it in his power to stop any publication which he deems objectionable, to confiscate the edition, and to prosecute the author and editor. Newspapers and pamphlets are generally subjected to a stricter censorship than larger works. See INDEX.

Pressburg. See PRESBURG.

Pressensé, EDMOND DE (1824-91), a prominent French Protestant theologian and controversialist, was born in Paris, studied there, and at Lausanne, Halle, and Berlin, and in 1847 became a pastor at Paris. He was deputy to the National Assembly for the Seine department in 1871-76, and was elected a senator for life in 1883. A strong thinker, vigorous writer, and eloquent preacher, Pressensé published many learned books, and contributed to *Chambers's Encyclopedia*.

Pressgang. Impressment was the mode formerly resorted to for manning the British navy. The practice had not only the sanction of custom, but the force of law. It may be traced in English legislation from the days of Edward I.; and many acts of parliament, from the reign of Philip and Mary to that of George III., were passed to regulate the system of impressment. Impressment consisted in seizing by force, for service in the royal navy, seamen, river-watermen, and at times landsmen, when state emergencies rendered them necessary. The pressgang, an armed party of reli-

able men commanded by officers, usually proceeded to such houses in the seaport towns as were supposed to be the resort of the seafaring population, laid violent hands on all eligible men, and conveyed them forcibly to the ships of war in the harbour. As it was not in the nature of sailors to yield without a struggle many terrible fights took place between the pressgangs and their intended victims—combats in which lives were often lost. In point of justice there is little, if anything, to be said for impressment, which had not even the merit of an impartial selection from the whole available population. Under the laws all eligible men of seafaring habits were liable between the ages of eighteen and fifty-five; but exemptions were made in favour of apprentices who had not been two years apprenticed, fishermen at sea, a proportion of able seamen in each collier, harpooners in whalers, and a few others. A pressgang could board a merchant-vessel or a privateer of its own nation in any part of the world, and carry off as many of the best men as could be removed without actually endangering the vessel. The exercise of this power made a privateer dread a friendly man-of-war more than an enemy, and often led to as exciting a chase as when enemies were in pursuit of each other; for the privateer's men were the best sailors, for their purpose, that the naval officers could lay hold on. Mitigations of the harsh laws on the subject were frequently introduced. As early as 1563 the naval authorities had to secure the sanction of the local justices of peace; in 1835 the term of an impressed man's service was limited to five years save in urgent national necessity. By that time the system was becoming obsolete. But the laws sanctioning impressment slumber, without being repealed.

Pressing to Death. See PEINE FORTE ET DURE.

Prester John, the name applied by medieval credulity for two hundred years to the supposed Christian sovereign of a vast but ill-defined empire in central Asia. The idea of a powerful Christian potentate in the far East, at once priest and king, was universal in Europe from about the middle of the 12th to the beginning of the 14th century, when it was transferred to Ethiopia and finally found a fancied historical justification in identification with the Christian king of Abyssinia.

The first mention of a Prester John, springing from the ancient race of the Magi of the Gospels, occurs in the Chronicle of Otto, bishop of Freisingen. Here, on the authority (1145) of the bishop of Gabala (*Jibet* in Syria), we find a circumstantial account of his power, his Christianity after the Nestorian pattern, his victories over the Medes and Persians, and how his progress to Jerusalem was stayed by the intervening Tigris, which refused to freeze over to give him passage. Again, about 1165, there was widely current in Europe an extravagant epistle supposed to be addressed by Prester John to the Greek emperor Manuel. Herein we read astounding wonders enough: how that he ruled over the three Indies and countless hordes of men, among them those nuclear races which Alexander the Great shut up within the northern mountains; that thirteen great crosses of gold and jewels were borne before as many armies, each of 10,000 knights and 100,000 foot; that all his subjects were virtuous and happy; attendant upon him were seven kings, sixty dukes, and 365 counts, twelve archbishops, and twenty bishops, while seventy-two kings with their kingdoms were his tributaries; before his throne stood a wondrous mirror, in which he saw everything that was happening in all his vast dominions; his kingdom contained the Fountain of Youth, the Sea of Sand, the River of Stones, and the river whose sand was precious gems,

ants that dug gold, fish that yielded purple, pebbles that give light and make invisible, and the salamander which lives in fire, from the incombustible covering of which were fashioned robes for the presbyter to wear. There is also extant a letter of date 1177, written by Pope Alexander III. and evidently addressed to the imaginary author of the grandiloquent epistle of 1165.

About the year 1221 the distant rumour of the conquests of Genghis Khan again gave strength to the belief in such a mighty Christian potentate. M. d'Avezac first pointed out the true historical source of the story in the Chinese Yeliu Tashii, founder of the empire of Kará-Khitái, who assumed the title of Gur Khán (supposed by Oppert to have been confounded with *Yukhanan* or *Johannes*), and fixed his capital at Balasaghun, north of the Tian Shan range. He defeated Sanjar the Seljuk sovereign of Persia in 1141 at a great battle near Samarkand, but, though hateful to the Moslem historians, of course never made any profession of Christian faith. Professor Bruun of Odessa identifies Prester John with the 12th-century Georgian prince John Orbelian, a redoubtable enemy of the Turks (see Colonel Yule's *Marco Polo*, 2d ed. 1875, app. to vol. ii.). Many writers about the close of the 13th century, as Marco Polo, the Sieur de Joinville, and even Gregory Abulfaraj, identify him with Ung Khán, king of the Nestorian tribe of Kerait. Friar Odoric about 1326 visited the country—the Tencuc of Marco Polo—still ruled over by a prince whom he styles Prester John, but he adds, with the cautious gravity of the true historian, 'as regards him, not one hundredth part is true that is told of him as if it were undeniable.' From this time the Asiatic phantom entirely disappears from view, but from the 14th century onwards Prester John continues a less romantic existence under the guise of the Christian king of Abyssinia.

See D'Avezac in vol. iv. (1839) of the *Recueil de Voyages et de Mémoires* of the Paris Société de Géographie; Dr Gustav Oppert, *Der Presbyter Johannes in Sage und Geschichte* (2d ed. 1870); Friedrich Zarncke, *Der Priester Johannes* (1876-79). See also Colonel Sir Henry Yule's article in *Encyc. Brit.* (9th ed.), his Hakluyt Society *Cathay and the Way Thither* (vol. i. 1866), and *The Book of Ser Marco Polo* (2d ed. 1875).

Preston, an important manufacturing town of Lancashire, a municipal, parliamentary, and county borough, on the north bank, and at the head of the estuary, of the Ribble, 14 miles from the Irish Sea, 28 NNE. of Liverpool, 31 NW. of Manchester, and 209 NNW. of London. Occupying an eminence 120 feet above the river, and built mostly of brick, it is on the whole well laid out, and is surrounded with pleasing scenery. The town-hall, built in 1862-67 from designs by Sir G. G. Scott, is a French Gothic pile, with a clock-tower and spire 195 feet high. In 1882 were laid the foundation-stones of the Lancashire county hall and of the Harris free library and museum, to the latter of which in 1883 Mr R. Newsham bequeathed a collection of pictures and art treasures. The churches are all modern, for even the parish church has been rebuilt. St Walburg's (Roman Catholic), by Hansom of cab-elevation, has a spire 306 feet high, the loftiest built in England since the Reformation, which amply redeems 'prond Preston' from its old 'no-steeples' reproach. Other edifices are the grammar-school (1550); rebuilt 1841, and removed to new buildings in Moor Park erected in 1911), the corn exchange and market-house (1824), public baths (1851), two covered markets (1870 and 1924), militia barracks (1856), the infirmary (1869), &c. Three large public parks were laid out in 1867—the Miller and Avenham parks, and the former unsightly 'Moor' of 100 acres to the north of the town. There have since

been added Haslam and Ribblesdale parks to the west and east, and Frenchwood Recreation Grounds on the banks of the Ribble, adjoining Avenham Park. In Miller Park a statue was erected in 1873 of the fourteenth Earl of Derby; in Winkley Square is a monument to Sir Robert Peel. Preston was constituted an independent port in 1843; and great improvements have been effected under the 'Ribble Navigation and Preston Dock Act, 1883,' including the deepening of the channel so as to admit vessels of 1000 tons, construction of a dock of 40 acres (opened 1892), erection of warehouses, &c. Arkwright (q.v.), who was born here in 1732, in 1768 set up here his famous spinning-fram; and Preston now is one of the principal seats of the cotton industry, which gradually superseded the linen manufacture, its staple in the 18th century. There are also iron and brass foundries, iron shipbuilding yards, engineering and machine shops, steam-boiler works, rope walks, &c. A guild-merchant festival, first clearly heard of in 1397, has been held regularly every twenty years since 1562—the last on 4th September 1922. Preston, the first of whose royal charters was granted by Henry II. in 1179, returns two members to parliament. Pop. (1811) 17,115; (1841) 50,073; (1881) 100,262; (1921) 119,900.

Preston arose whilst ancient *Coccurn* or Ribchester, higher up the Ribble, decayed. In Athelstan's reign Amonderness, the hundred in which it is situated, was granted to the cathedral church of York; hence its chief town came to be known as Preston or 'priests' town'. Near Preston, on 17th August 1648, Cromwell totally routed the royalists under Sir Marmaduke Langdale; and Preston figures in both the Jacobite rebellions of 1715 and 1745. For Forster's little army surrendered here to General Willes; and Prince Charles Edward occupied the town on both his march to and his retreat from Derby. Lady Hamilton has been claimed, but falsely it seems, as a native. On 1st September 1832 Joseph Livesey of Preston and six others here signed a pledge of total abstinence. See TEMPERANCE.

Prestonpans, a coast-town of Haddingtonshire, 8 miles E. of Edinburgh. Its salt-pans flourished from the 12th century till 1825; now brewing and mining are the principal industries. Pop. 2000. To the south-east, on 21st September 1745, was fought the battle of Prestonpans, Preston, or Gladsmuir, when in a five minutes' rush Prince Charles Edward's 2500 Highlanders completely routed 2300 disciplined soldiers under Sir John Cope and Colonel Gardiner (q.v.).

Prestwich, a cotton manufacturing town of Lancashire, 4 miles NNW. of Manchester, with a 13th c. Gothic church. Pop. 19,000.

Prestwich, SIR JOSEPH (1812-96), was a London wine-merchant till he was sixty, in 1874 became professor of Geology at Oxford, and in 1896 was knighted. See the Life by his wife (1899).

Prestwick, the headquarters of golf on the Ayrshire coast, a parliamentary burgh of Ayr group since 1918, 24 miles N. of Ayr; pop. 8500.

Presumption, an inference drawn by the law in certain circumstances, and used to start an argument. A person who has possession of goods is presumed to be the owner till the contrary is proved. A man is presumed to be innocent till the contrary is proved. The law of England presumes that any one who has not been heard of for seven years is dead. Under the Presumption of Life Limitation Act, 1891, applicable to Scotland only, the court, on application being made to it, may find that a person who has disappeared for seven years has died on any date within the seven years which is established by the

facts, or, failing the establishment of such a date, may find that the person is to be presumed to have died at the expiry of the seven years' disappearance.

Pretender. See JACOBITES, STEWART.

Pretoria, administrative capital of the Union of South Africa and of the Transvaal, stands on a plain sheltered by mountains, 980 miles from Capetown and 285 by rail (1893) W. of Lourenço Marques, on Delagoa Bay. It is named from the Boer leader Andries Pretorius (died 1853), who saved the Trekkers by repeatedly defeating the Zulus, till then triumphant (see TRANSVAAL). New public buildings were erected in 1891. Pretoria has a university college, a Transvaal museum (with a zoological garden), and a branch mint (1922). During the Transvaal war it was formally occupied by Lord Roberts on 5th June 1900. Pop. 74,000 (45,000 white).

Preussen. See PRUSSIA.

Preveza, a town won in 1912 by Greece from Turkey, on the Gulf of Arta, trades in cheese, olives, and cattle; pop. 7000.

Prévost, ABRÉ. Antoine François Prévost d'Exiles, commonly called the Abbé Prévost, and immortal as the author of *Manon Lescaut*, was born of good family at Hesdin in Artois, 1st April 1697. He was educated by the Jesuits at Hesdin, and at the Collège d'Harcourt in Paris, at sixteen volunteered for service as the last war of Louis XIV. was drawing to its close, but soon returned to the Jesuits, and indeed had almost joined the order when a fresh temptation drew his impulsive and restless nature once more to the soldier's life. Of this second period of soldiering little is known, but it is certain that at twenty-four he joined the Benedictines of St Maur, and spent the next six years in a round of religious duties, in study, and in writing a volume of *Gallia Christiana*. About the year 1727, being anxious to be transferred to Cluny, where the rule was less austere, he discounted his permission, and so found himself unexpectedly guilty of the sin of disobedience. He fled to Holland, and spent six years of exile in that country and in England, and there is even a dim story of a love entanglement against which he strove for a while in vain. In 1728 he published the first and best of his long novels, the *Mémoires d'un Homme de Qualité*, to which indeed *Manon Lescaut* (apparently first published at Amsterdam in 1733) forms a kind of supplement. His fluent pen employed itself in further novels, in translations, and in *Le Pour et Contre* (1733-40), a periodical review of life and letters, modelled on the *Spectator*, and showing an excellent appreciation of English books. By 1735 he was back in France by royal permission, and allowed to wear the dress of the secular priesthood. He was be-

about 1782, and was completely disproved by Harisse (see his *L'Abbé Prévost*, 1896). Many other legends have clustered round Prévost's romantic life. Of these the most remarkable is a perfectly baseless calumny that he killed his own father, who had caught him in an intrigue, by throwing him downstairs.

Prévost's is one of the names lifted securely above the flood of time by one book written in a moment of happy inspiration. *Manon Lescaut* remains fresh, charming, and perennial, from its perfect and unaffected simplicity, the stamp of reality and truth throughout, and a style so flowing, easy, and natural, that the reader forgets it altogether in the overpowering pathetic interest of the story. The half-dozen figures portrayed have the likeness of life itself: the young Chevalier des Grieux, the hero, is a lover of the noblest pattern, absolutely forgetful of self, and idealising even the unworthiness of his mistress; Tiberge is an admirable type of the sensible and faithful friend, Lescaut, Manon's brother, of the rufian and bully; but the triumph of the book is Manon herself, charming, light-hearted, shallow, incapable of a love that she will not sacrifice for luxury, yet ever moved with a real affection for her lover, constant even in her inconstancy and her degradation, the goodness ever shining through the guilt, and at last purified by love and suffering. One feels in this unique book that it is impossible to say where reality ends and fiction begins, and indeed it remains to this day unequalled as a truthful realisation of one over-mastering passion. From beginning to end a careful reader detects the traces of a sad experience, for its author had himself a sensitive heart and warm imagination, joined to a weak and vacillating character. Both a Tiberge and a Des Grieux met in himself, for his character and ideals were pure and elevated, despite the weaknesses that grew out of his passionate and impulsive soul.

There is no complete edition of Prévost's works. His *Œuvres Choixées* were collected at Amsterdam (39 vols. 1783-85). Of his one masterpiece the editions are numberless, and there are translations by Charlotte Smith (1785), Moylan (1841), G. D. Gribble (1925), and others. See the biography prefixed to *Prévost's Pensées* (1764); *Sainte-Beuve in Portraits Littéraires*, vols. i. and ii., and *Causeries du Lundi*, vol. ix.; and books by Harisse (Paris, 1896) and Schroeder (1899).

Prey, BIRDS OF. See BIRDS OF PREY.

Priam, king of Troy at the time of the Trojan war, was the son of Laomedon and Strymo or Placia. The name means 'the ransomed,' and was given him on account of his having been ransomed by his sister Hesione from Heracles, into whose hands he had fallen. His first wife was Arisba, daughter of Merops, whom he gave away to a friend in order to marry Hecabe (Hecuba), by whom, according to Homer, he had nineteen sons. He had altogether fifty sons; later writers add as many daughters. The best known of these are Hector, Paris, Deiphobus, Helenus, Troilus, and Cassandra. Priam is represented as too old to take any active part in the Trojan war, and in Homer only once appears on the field of battle. After Hector's death he went to the tent of Achilles to beg the body for burial. The oldest Greek legends are silent respecting his fate; but later poets like Euripides and Virgil say that he was slain by Pyrrhus when the Greeks stormed the city.

Priapus, son of Dionysus and Aphrodite, born at Laupæus on the Hellespont, considered as a divinity of fruitfulness, especially of flocks of sheep and goats, of bees, the vine, and of all kinds of garden produce. His statues usually stood in gardens, in the form of rude wooden images,

général des Voyages (of which vol. i., 1746, contains a fine portrait by Schmidt), histories, moral essays, translations of *Pemela* and *Clarissa Harlowe*, and at least one novel—*Histoire d'une Grecque Moderne*. In 1741 a literary service thoughtlessly rendered to a satirical novelist drove him from France to Brussels, thence to Frankfurt; but he was soon forgiven by M. de Manrepas, and allowed to return. He lived in a cottage at Saint-Firmin near Chantilly, walked much in the woods there, and died of the rupture of an aneurism, 23d November 1763. The story was long current that after he was thought to have died of apoplexy, a stupid surgeon, in haste to begin a post-mortem examination, both brought him to life and killed him with a single thrust of his knife; but this hideous romance first appeared

painted vermillion, with a club, sickle, and phallic symbol of exaggerated dimensions.

Přibram, a mining town of Bohemia, 48 miles by rail SSW. of Prague, has important lead and silver mines, and various manufactures, a mining academy, technical schools, and a church much frequented by pilgrims. Pop. 15,000.

Pribilof Islands. See ALASKA, SEAL.

Price, the exchangeable value of commodities. See CURRENCY, EXCHANGE, MONEY, VALUE, and works cited at POLITICAL ECONOMY.

Price, RICHARD, philosopher, was born at Tyn-ton, in Glamorganshire, on 22d February 1723. His father was a dissenting minister, morose, bigoted, and intolerant, in complete antithesis to the disposition of the son. As a boy he read Clarke and Butler, went at eighteen to a dissenting academy in London, and at the close of his studies became chaplain to a Mr Stratfield at Stoke-Newington, with whom he lived for thirteen years. Legacies from his patron and an uncle in 1756 enabled him to marry. He laboured as a preacher at Newington Green and at Hackney, and established a reputation by his somewhat heavy but able *Review of the Principal Questions in Morals* (1758). His apologetic work, *On the Importance of Christianity*, appeared in 1766. In 1769 he received from Glasgow the degree of D.D., and published his *Treatise on Reversionary Payments*; which was followed by the compilation of the celebrated *Northampton Mortality Tables*, and various other works of value relating to life assurance and annuities. In 1771 appeared his famous *Appeal to the Public on the Subject of the National Debt*; in 1776 his *Observations on Civil Liberty and the Justice and Policy of the War with America*. The latter brought him the freedom of the city of London and an invitation from congress to assist in regulating its finances. Price lived long enough to herald the promise of the French Revolution, and to be denounced in Burke's *Reflections*. He died April 19, 1791. Price was a believer in the immortality of the soul, holding that it remained in a dormant state between death and resurrection. Their difference of opinion on this subject led to a controversy of some celebrity between him and his friend Dr Priestley. His views respecting the divinity of Christ were what is called Low or semi-Arian. As a moralist he has a close affinity with Cadworth, and in some points strangely foreshadows Kant. Of his great treatise on morals the chief positions are these: actions are *in themselves* right or wrong; right and wrong are simple ideas incapable of analysis; these ideas are received immediately by the intuitive power of the reason or understanding. See the Lives by his nephew, William Morgan (1815), and by Roland Thomas (1924).

Prichard, JAMES COWLES, ethnologist, was born at Ross in Herefordshire, 11th February 1786. The son of a Quaker merchant, he received a careful home education at Ross and in Bristol. There, at St Thomas's, London, and in Edinburgh he studied medicine; and in 1810, after a residence both at Cambridge and at Oxford, he commenced practice in Bristol as a physician. He was appointed physician to Clifton dispensary and St Peter's Hospital, and afterwards to the Bristol Infirmary. In 1813 appeared his *Researches into the Physical History of Mankind*, which at once secured him a high standing as an ethnologist. The different editions of this work (4th, 5 vols. 1841-51) gave further proofs of the zeal with which he pursued his ethnological inquiries; and at the same time he devoted himself much to philology, which he judged indispensable for an enlarged study of ethnology. He made himself

master not only of the Romance, Teutonic, and Celtic languages, but also of Sanskrit, Hebrew, Arabic; and in *The Eastern Origin of the Celtic Nations* (1831; 2d ed. by Latham, 1857) he compared the different dialects of Celtic with the Sanskrit, Greek, Latin, and Teutonic languages, and argued for the common origin for all the peoples speaking those languages. Besides several medical works, he also published an *Analysis of Egyptian Mythology* (1819; Ger. trans. by A. W. von Schlegel, 1837) and *The Natural History of Man* (2 vols. 1843). Appointed in 1845 a commissioner in lunacy he removed to London, where on 22d December 1848 he died of rheumatic fever. The first to raise ethnology to the rank of a science, he was himself a monogenist, maintaining that man is one in species, and that the negro is the primitive type of the human race.

Prickle. See HAIRS OF PLANTS.

Prickly Heat is the popular name in India and other tropical countries for a form of skin disease sometimes known as *Lichen tropicus* (see LICHEN). It more frequently attacks strangers from temperate climates than the natives, although the latter are not altogether exempt from it. It consists in a copious eruption of small red papules. The sensations of itching and stinging which attend it are intense, and give rise to an almost irresistible propensity to scratching, which only aggravates the irritation. Avoidance of perspiration as far as possible, baths of plain cold water, and the use of dusting powders and spirit lotion are helpful.

Prickly Pear, or INDIAN FIG (*Opuntia*), a genus of Cactaceæ (q.v.), having a fleshy stem generally formed of compressed articulations; leafless, except that the youngest shoots produce small cylindrical leaves which soon fall off; generally covered with clusters of strong hairs or of prickles; the flowers springing from among the clusters of prickles, or from the margin or summit of the articulations, solitary, or corymbose, paniculate, generally yellow, rarely white or red; the fruit resembling a fig or pear, with clusters of prickles on the skin, mucilaginous, generally eatable, that of some species pleasant, that of others insipid. The prickles of some species are so strong, and their stems grow up in such number and strength, that they are used for hedge-plants in warm countries. They are natives of America from 50° N. to 40° S. lat., especially Mexico and Chile. The Common Prickly Pear or Indian Fig (*O. vulgaris*), a native of Virginia and more southern parts of North America, is now naturalised in many parts of the south of Europe and north of Africa, and in other warm countries. It grows well on the barest rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. It is of humble growth; its fruit oval, rather larger than a hen's egg, yellow, and tinged with purple, the pulp red or purple, juicy, and pleasantly combining sweetness with acidity. It is extensively used in many countries as an article of food. In the south of England the prickly pear hives in the open air, and occasionally ripens its fruit. In America it is cultivated considerably to the north of its native region. The Prickly Pear is naturalised in Europe as far north as the sunny slopes of Tyrol, where it is smaller and has prostrate stems. In Australia and South Africa prickly pears of various species have become a pest. The Australian governments have striven in vain to cope with *O. inermis*, *O. stricta*, and others by means of insects, fungi, and other methods. Utilisation as a source of industrial alcohol has been attempted in South Africa. The Tuna (*O. Tuna*), a hedge plant in the West Indies, affords food to the cochineal insect, and yields a pleasant fruit.

Pride, THOMAS, one of the most resolute of Cromwell's soldiers, was a native of London. At first a drayman and brewer, he enlisted at the outbreak of the Civil War, and by his merit quickly rose to be colonel. He commanded a brigade under Cromwell in Scotland, and, when the House of Commons betrayed a disposition to effect a settlement with the king, was appointed by the army to purge it of its Presbyterian royalist members. By 'Pride's Purge' about a hundred were excluded, whereupon the House, now reduced to about eighty members, proceeded to bring the king to justice. Colonel Pride sat among his judges, and signed the death-warrant. He died 23d October 1658, and so felt not the rage of his enemies, but his body was dug up and hanged beside Cromwell's at Tyburn.

Prideaux, HUMPHREY (1648-1724), scholar and divine, born at Paulstow, was educated at Westminster School under Dr Busby, and at Christ Church, Oxford, where he graduated B.A. in 1672. His *Marmora Orontiensia* (1676), an account of the Arundel Marbles, procured for him the friendship of Lord Chancellor Finch (afterwards Earl of Nottingham), who in 1679 appointed him rector of St Clement's, Oxford, and in 1681 a prebendary of Norwich. After several minor preferments he was collated in 1688 to the archdeaconry of Suffolk, and in 1702 was made Dean of Norwich. His nine works include a *Life of Mahomet* (1697), long very popular; *Directions to Churchwardens* (1701); and *The Connection of the History of the Old and New Testament* (1715-17). The last treats with much learning, but less discernment, the affairs of ancient Egypt, Assyria, Persia, Judaea, Greece, and Rome, in their bearing on prophecy. See *Prideaux's Letters to John Ellis*, edited by E. M. Thompson, (Camden Soc. 1875).

Pride of China (also called Pride of India and Bead-tree), a handsome tree of the family Meliaceæ (*Melia Azadirach*), a native of India, Persia, and China, naturalised in the southern states of the American Union. It grows rapidly, has large bunches of flowers, and enormous quantities of small fruit. A decoction of the bark of its root is used as a vermifuge.

Priego de Córdoba, a town of Spain, 46 miles S.E. of Córdoba, grows wine and weaves silk; pop. 20,000.

Priene, anciently one of the 'twelve' cities of Ionia, stood a little N.W. of the mouth of the Meander in Caria. From the remains of an elegant Ionic temple to Athene Polias an agent of the British Society of Dilettanti carried off and gave to the British Museum the stone bearing the record of its dedication by Alexander the Great. See *Antiquities of Ionia*, part iv. (1882), Wiegand and Schrader, *Priene* (1904).

Priessnitz. See HYDROTHERAPY.

Priest (Gr. *presbyteros*, Lat. *presbyter*, lit. 'elder'), the title in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In Egypt priests and laymen were not in the Old Kingdom separate classes, but laymen (and women) took their turn in performing priestly offices. As time went on, endowments to maintain offerings to the dead at tombs developed a class of tomb chaplains, who have been compared with the mediæval chantry-priests. In the Middle Kingdom professional chief priests took the place of the nobles in the temples, with laymen serving under them; and under the XVIIIth dynasty the great college of priests of Amun-Re at Thebes set an example that was followed elsewhere, so that at last the priesthood

became almost a caste. The priesthood of India belongs to the first caste, or that of the Brahmans, exclusively (see CASTE, INDIA). But, as the proper performance of such functions requires, even in a Brahman, the knowledge of the sacred texts to be recited at a sacrifice, and of the complicated ceremonial of which the sacrificial acts consist, none but a Brahman learned in one or more Vedas, and versed in the works treating of the ritual, possesses, according to the ancient law, the qualification of a priest. See also BUDDHISM, LAMAISM, SUN-CULT.

In Jewish history the patriarchal period furnishes an example of the family priesthood; while in Melchizedec, king of Salem, we find the union of the royal with the priestly character. In the Mosaic law the whole theory of the priesthood, as a sacrificial and mediatorial office, is fully developed. The priest of the Mosaic law stands in the position of a mediator between God and the people. The Mosaic priesthood was the inheritance of the family of Aaron, of the tribe of Levi (q.v.). It consisted of a High-priest (q.v.), and of inferior ministers, distributed into twenty-four classes. In the service of the temple each class was subject to a chief priest, and served for a week in rotation. The duties in the temple consisted in preparing, slaying, and offering victims, in preparing the show-bread, burning the incense, and tending the lights of the sanctuary. Outside they were employed in instructing the people, attending to the daily offerings, enforcing the laws regarding legal uncleanness, &c. For their maintenance were set aside certain offerings (see FIRST-FRUIT) and other gifts. They wore a distinguishing dress, the chief characteristics of which were a white tunic, an embroidered cincture, and a turban shaped head-dress. The Jewish priesthood may be said to have practically ceased with the destruction of the temple.

In the Christian dispensation the name primitively given to the public ministers of religion was *presbyteros*. The name given in classical Greek to the sacrificing priests of the pagan religion, *hierus*, Lat. *sacerdos*, is not found in the New Testament explicitly applied to ministers of the Christian ministry; but very early in ecclesiastical use it appears as an ordinary designation; and with all those bodies of Christians—Roman Catholics, Greeks, Syrians, and other Orientals—who regard the eucharist as a sacrifice (see LITURGY) the two names were applied indiscriminately. The priesthood of the Christian church is one of the grades of the hierarchy, second in order only to that of bishop, with which order the priesthood has many functions in common. The priest is regarded as the ordinary minister of the eucharist, whether as a sacrament or as a sacrifice; of baptism, penance, and extreme unction; and although the contracting parties are held in the modern schools to be themselves the ministers of marriage, the priest is regarded by all schools of Roman divines as at least the normal and official witness of its celebration. The priest is also officially charged with the instruction of the people and the direction of their spiritual concerns, and by long-established use special districts, called parishes, are assigned to priests, within which they are entrusted with the care and supervision of the spiritual wants of all the inhabitants. The holy order of priesthood can only be conferred by a bishop, and he is ordinarily assisted by two or more priests, who, in common with the bishop, impose hands on the candidate. The rest of the ceremonial of ordination consists in investing the candidate with the sacred instruments and ornaments of his order, anointing his hands, and reciting certain prayers significative of the gifts

and the duties of the office. The distinguishing vestment of the celebrant priest in the mass is the *Chasuble* (q.v.). In Catholic countries priests wear even in public a distinctive dress, in most respects common to them with the other orders of Clergy (q.v.). In the Latin Church priests are bound to a life of celibacy. In the Greek and oriental churches married men may be advanced to the priesthood; but no one is permitted to marry after ordination, nor is a married priest permitted to marry a second time, should his wife die.

In the Church of England, and other Reformed Episcopal Churches, the term priest is retained as the designation of the second order of clergy, whose special office it is (1) to celebrate the Sacrament of the Lord's Supper; (2) to pronounce the forms of Absolution in the Morning and Evening Prayer, in the Communion Service, and in the Office for the Visitation of the Sick; and (3) to preach, though this last office is, by special license, sometimes extended to deacons. See DEACON, ORDERS (HOLY).

Priestley, JOSEPH, son of a cloth-dresser, was born at Fieldhead, near Leeds, 13th March 1733. For some time he was obliged to abandon school studies, owing to weak health, and betook himself to mercantile pursuits, but with retaining strength his literary studies were resumed at a dissenting academy at Daventry (founded by Dr Doddridge). Though his father and family were strong Calvinists, young Priestley, during his residence at the academy, felt called on to renounce nearly all the theological and metaphysical opinions of his youth. 'I came,' he says, 'to embrace what is called the heterodox side of every question.' In 1755 he became minister to a small congregation at Needham Market, in Suffolk. While here he composed his work against the doctrine of Christ's death being a sacrifice or satisfaction for sin, entitled *The Scripture Doctrine of Remission*. In this he taught that the Bible is indeed a divine revelation, made from God to man through Christ, himself a man and no more, nor claiming to be more, and rejected the doctrines of the Trinity and the Atonement. In 1758 he quitted Needham for Nantwich; and in 1761 he removed, as teacher of languages and belles-lettres, to an academy at Warrington; and here his literary career may be said first fairly to have begun. A visit to London led to his making the acquaintance of Franklin, who supplied him with books which enabled him to write his *History and Present State of Electricity*, published in 1767. It was followed by a work on *Vision, Light, and Colours*. In 1762 he published his *Theory of Language and Universal Grammar*. In 1764 he was made LL.D. of Edinburgh, and F.R.S. in 1766. In the following year he removed to Leeds, having been appointed minister of the Mill Hill dissenting chapel there. The fact of a brevity being beside his dwelling gave a new direction to his energetic and versatile mind; he began to study chemistry. In 1773 he was appointed literary companion to Lord Shelburne, and accompanied the earl on a continental tour in 1774. Having been told by certain Parisian savants that he was the only man of understanding they had ever known who believed in Christianity, he wrote, in reply, the *Letters to a Philosophical Unbeliever*, and various other works, containing criticisms on the doctrines of Hume and others. But, while laughed at in Paris as a believer, at home he was branded as an atheist. To escape the odium arising from the latter imputation, he published, in 1777, his *Disquisition relating to Matter and Spirit*, in which, partly materialising spirit and partly spiritualising matter, he holds that our hopes of resurrection must rest solely on the truth of the Christian revelation, and that on science they have no foundation whatever. On leaving Lord Shel-

burne, he became minister of a dissenting chapel at Birmingham. The publication, in 1786, of his *History of Early Opinions concerning Jesus Christ* occasioned the renewal of a controversy, which had begun in 1778, between him and Dr Horsley, concerning the doctrines of Free-will, Materialism, and Unitarianism. His reply to Burke's *Reflections on the French Revolution* led to his being made a citizen of the French Republic; and this led to a mob on one occasion breaking into his house and destroying all its contents, books, manuscripts, scientific instruments, &c. A brother-in-law, however, about this time left him £10,000, with an annuity of £200. In 1791 he was elected to a charge at Hackney; but his honestly-avowed opinions had made him unpopular, and he (1794) removed to America, where he was heartily received. He died at Northumberland, Pennsylvania, 6th February 1804, expressing (though he agreed that he should be called a materialist) his confidence in immortality. He was a man of irreproachable character, serene of temper, fearless in searching after and confessing the truth. His services to chemistry are summed up under that head (and see OXYGEN).

See Rutt's edition of Priestley's *Works* (25 vols. 1832), including Autobiographical Memoir; *Mattinean's Essays* (vol. I. 1891); Thorpe's *Priestley* ('Men of Science' series, 1906); E. F. Smith's *Priestley in America* (1920).

Priestly Code. See PENTATEUCH, BIBLE.

Priluki, a town of Ukraine, 87 miles E. by N. of Kiev, with trade in corn and cattle; pop. 24,000, mostly engaged in the cultivation of tobacco.

Prim, JUAN, Spanish general, was born at Reus, 6th December 1814, and rapidly rose to be a colonel, and so distinguished himself in war and statesmanship as to be made general, marshal, and marquis. As progressist he opposed Espartero. Failing in an insurrectionary attempt in 1866, he had to flee to England and Brussels, but here he guided the movement that in 1868 overthrew Isabella. He was war minister under Serrano, but soon became virtually dictator. He seemed the election of an Italian prince, Amadeo, as king (in order, as was thought, that the king might be under the minister's control), and was thereupon shot by an assassin as he left the Cortes, 28th December 1870. He died on the 30th.

Prima Donna (Ital), the first female singer in an opera.

Primage, a charge (over and above the freight) paid by the shipper or consignee of goods for loading the same, to the master and sailors of a ship, or to the owner or freighter.

Primary Colours. See COLOUR.

Primary Rocks. See PALÆOZOIC.

Primate (Lat. *primas*), anciently a bishop holding a position of pre-eminence. Thus the bishop of Rome was called primate of the whole church. In modern times the title belongs only to such sees as had formerly the dignity of vicar of the holy see annexed—Armagh, Arles and Lyons, Mainz, Toledo, Pisa and Salerno, &c. But none of these possess any special primate jurisdiction. For the primates in the Church of England, see the article ARCHBISHOP. The name *primus* is applied in the Scottish Episcopal Church to the presiding bishop. He is chosen by the bishops out of their own number, without their being bound to give effect to seniority of consecration or precedence of diocese.

Primates, the order of Mammals (q.v.) which Linnaeus placed first (whence the name, Lat. *primus*, 'first') because it includes Man (q.v.). See also ANTHROPOLOGY, APE, ANTHROPOID APES, MONKEYS, LEMUR.

Prime, the first of the 'lesser hours' of the Roman Breviary (q.v.).

Prime-minister. See TREASURY, CABINET.

Primer, or **PRIME**, a game at cards popular in England in the 16th century, but now obsolete. The same or a very similar game was played in Italy under the name *primiera*, and in France under the names *prime*, *ambigu*, &c. *Primer* belonged to the family of games of which the old post and pair and the more modern brag and poker are members.

Primitive Methodists. See METHODISTS.

Primo de Rivera, MIGUEL, MARQUÉS DE ESTELLA, Spanish dictator, born in 1870, was a general placed over the military district of Catalonia when in 1923 he effected a *coup d'état* whereby a military directory took over the government of Spain. In 1925 the directory was nominally changed to a cabinet, without restoration of parliamentary government.

Primogeniture is the rule of law under which the eldest child or ('male primogeniture') eldest son of the family succeeds to the father's real estate in preference to, and in absolute exclusion of, the younger sons (and all the sisters). See BOROUGH ENGLISH, ENTAIL, FAMILY, FEUDALISM, FIRST-BORN, GAVELKIND, KIN (NEXT OF), LAND LAWS, SUCCESSION; and the valuable monograph on *Primogeniture* (1895) by Evelyn Cecil.

Primordial Zone, a name applied by Barroide to the group of strata which in Bohemia underlies the Silurian rocks, and is therefore on the horizon of the Cambrian system.

Primrose (*Primula*), a genus of Primulaceæ, having a bell-shaped or tubular five-toothed calyx, a salver-shaped corolla with five segments, five stamens, a globose ovary containing many ovules, and a many-sided capsule opening by five valves, generally with ten teeth at the apex. The dimorphism of the stamens and pistil of primrose, illustrated in the accompanying figure, is not uncommon in other species of the genus, and has given rise to the terms *thrum-eyed* (A) and *puce-eyed* (B) in the language of florists in describing

Primroses: short (A) and long styled (B).

varieties of the *Auricula* and *Polyanthus*. The distinction is of some practical importance in so far as fertilisation of the individual flowers is affected by the relative positions of the respective organs. The species are all herbaceous perennials, generally having only radical leaves; and the flowers in a simple umbel, more rarely with scapes bearing solitary flowers. Almost all of them are natives of Europe and Asia. Some of them are among the finest ornaments of our groves and meadows; some are found in mountainous regions. Their fine colours and soft delicate beauty have led to the cultivation of some of them as garden flowers, probably from the very

beginning of floriculture. The name refers to the early appearance of the flowers of some of the most common species in spring. The Common Primrose (*P. vulgaris*), abundant in woods, hedgerbanks, and

Common Primrose (*Primula vulgaris*).

pastures in Britain and in most parts of Europe, has obovate-oblong, wrinkled leaves, and single-flowered scapes; the flowers about an inch broad, pale yellow. This is the plant to which the English name primrose specially belongs. Akin to it is the Cowslip (q.v.) or Paigle (*P. veris*). The Oxlip (*P. elatior*), apparently wild in some parts of England, particularly in the eastern counties, may be a hybrid between the common primrose and the cowslip. The *Polyanthus* (q.v.) is a cultivated oxlip. The *Auricula* (q.v.; *P. Auricula*), an Alpine species, is a favourite garden flower. The Bird's-eye Primrose (*P. farinosa*) and the Scottish Primrose (*P. scotica*) are both flowers of exquisite beauty, found in the northern parts of Britain, the latter chiefly on the coasts of Sutherland, Caithness, and Orkney. The Alps and the Himalaya produce many species. The Chinese Primrose (*P. sinensis*) is very common in Britain, not only as a greenhouse but a window plant. It produces compound umbels of very numerous lilac, red, or white flowers, which are displayed in autumn, winter, and spring. In the western states of America the most conspicuous species is *P. Parryi*, with large purple flowers, which grows on the Rocky Mountains. *P. farinosa*, in the eastern states, is rare.

Primrose League. This political organisation was founded 17th November 1883 by Lord Randolph Churchill, Sir John Gorst, Sir Alfred Slade, and Sir H. Drummond Wolff. The name was chosen in reference to the fact that the primrose was Lord Beaconsfield's favourite flower (a fact by some unkindly disputed; cf. *Notes and Queries* for 1888, pp. 146, 416). It was originally intended to admit men only, banded in companies of about 100 to act as missionaries of the league. The effect of admitting women may be gathered from the fact that the number of members rose from 957 in 1884 to 237,283 in 1886.

Primula. See PRIMROSE, COWSLIP, AURICULAR POLYANTHUS.

Primulaceæ, a family of dicotyledons mostly natives of temperate and cold regions. They are all herbaceous, or scarcely half-shrubby, with leaves generally all radical, and no stipules. The calyx is generally five-cleft, inferior or half-superior, regular, persistent; the corolla, with the limb divided into as many segments as the calyx, rarely wanting; the stamens inserted on the corolla, one opposite to each of its lobes; the ovary one-celled, the style solitary, the stigma capitate; the capsule with a central placenta and many seeds. Large

genera are Primula, Lysimachia, and Androsace. Besides the two first mentioned, Britain has representatives of Hottentia, Centaurea, Glaux, Anagallis, Cyclamen, Trientalis, and Samolus. Many

Flowers of a few of the Primulaceae.

a, *Primula sikkimensis*; b, *P. obconica*; c, *P. Sieboldii*; d, common primrose (*P. vulgaris*); e, cowslip (*P. veris*).

of the Primulaceae have flowers of much beauty, as the Primrose, Cowslip, Auricula, Pimpernel, &c., and some are very fragrant.

Primum Mobile. See PTOLEMY.

Prince (Lat. *princeps*), an epithet which was originally applied to the *princeps senatus* of the Roman state, and afterwards became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterwards applied to persons enjoying kingly power, more especially the rulers of small states, either sovereign or dependent. The title is now very generally applied to the sons of kings and emperors and persons of the blood-royal. The word prince translates two German titles: *Fürst* (ranking below Herzog or duke), and *Prinz*, the latter given (1) to all members of sovereign houses, and (2) to such members of noble families as already held the title Fürst in the time of the Holy Roman Empire (i.e. up to 1806). In various parts of continental Europe the title prince is borne by families of eminent rank but not possessed of sovereignty. Practically in Britain the term prince is restricted to members of the royal family. In France, under the old regime, dukes took precedence of princes; and many dukes had princedom as minor titles. Napoleon put his new created princes above dukes. In Italy princes rank after dukes, sons of dukes being called princes.

Prince Edward Island is a province of the Dominion of Canada, having entered the confederation in 1873. It is situated in the Gulf of St. Lawrence, and is separated from New Brunswick and Nova Scotia by Northumberland Strait. The greatest length of the island is 140 miles; its breadth varies from 2 to 34 miles, and it has an area of 2184 sq. m., nearly all of which is occupied. The population in 1921 numbered 88,615. Although discovered by the Cabots, no claim was made to it by the British on that account. Possession was assumed by the French, but little was done towards its settlement until 1715, when its fertility attracted some Acadians from Cape Breton. It was finally ceded to Great Britain in 1763. In the first

instance it formed part of Nova Scotia, but in 1768 was made a separate province. The pop. in 1763 was 4000; but about that time an emigration set in to the mainland, and the Acadians were expelled, so that in 1768 it had been reduced to about 1300 (see ACADIA). Until 1799 it was called St. John's Island, but its name was then changed to Prince Edward Island, in compliment to the Duke of Kent, who paid it a visit in that year. Prior to 1875 most of the land was the property of absentee proprietors, and for many years the land question was a source of difficulty. The local government, however, passed a measure in 1875 giving itself powers to buy out the landlords, and to sell the land to the tenants or others on easy terms of repayment. By this legislation a fruitful source of irritation was removed, and the agricultural industry—the principal one in the province—placed on a more satisfactory footing.

Seen from the water, the appearance of the island is exceedingly prepossessing. The surface is undulating, but never exceeds 500 feet; the soil is very fertile, consisting generally of a light-reddish loam, and occasionally of a stiffer clay, resting in some places on red sandstone, although in other localities it seems to be entirely alluvial. All kinds of cereals, roots, and vegetables are raised. Oats and potatoes from the island enjoy a special reputation, and the same thing may be said of its sheep and horses. A natural manure, called mussel mud, made of decayed oyster, clam, and mussel shells, is found on the coasts. It is largely used by the farmers, and is said to be a most valuable fertiliser. Although coal is known to exist, it is not worked, owing to the depth at which it is found and the cheapness at which it can be purchased from Nova Scotia. There are apparently no other minerals on the island. The climate is healthy, being milder than that of the mainland, and freer from fogs. The spring is often backward, but the summer months are enjoyable. Prince Edward Island is without doubt the best fishing station in the Gulf of St. Lawrence, but the habits and feelings of the people are so decidedly agricultural that the fisheries have not received from them the attention they deserve. They are chiefly for mackerel, lobsters, herring, cod, lake, and oysters; while salmon, bass, shad, halibut, and trout are caught in limited quantities. The oyster fishery is capable of vast development. The oysters are considered the finest in the world. Lobsters are exported. The conditions are also favourable for the breeding and rearing of live stock, of which large numbers are annually exported to other parts of Canada and the eastern states of the American Union. Silver foxes are bred for their fur.

The coast-line is a succession of bays and projecting headlands; the largest bays are Egmont, Hillsborough, and Cadogan, which by penetrating into the land from opposite directions form narrow isthmuses, dividing the island into three distinct peninsulas. Charlottetown is the capital, and has a pop. of 12,000. Other principal towns are Summerside (3000), Georgetown, and Somers. The rivers are naturally short, but the province is well watered. Shipbuilding is long since extinct; manufactures are not carried on to any large extent, and chiefly for local purposes. The making of butter and cheese on co-operative principles, a new development, has greatly increased. There is a railway, built and worked by the Dominion government, running from one end of the island to the other. The island is connected by telegraph with the mainland, and there is daily steam communication between the two, although it is occasionally interrupted during the winter. A tunnel (9 miles) under the Northumberland Strait, has been talked of. The settlers are predominantly of English,

Irish, and Scottish descent, with many of French, German, and Scandinavian origin. Roman Catholics number some 39,000; Presbyterians, 26,000; Methodists, 11,400; Baptists and Anglicans each about 5000. Free education has prevailed since 1853. There are two colleges—the Prince of Wales (Protestant) and St. Dunstan's (Roman Catholic). The government of the island is administered by a lieutenant governor, appointed by the governor-in-council, and paid out of federal funds. The legislative assembly consists of thirty members—fifteen councillors elected by property-holders, and fifteen assemblymen elected by universal suffrage. These sit side by side and have exactly the same powers. The province has four representatives in the Dominion House of Commons. Its revenue is supplemented by a subsidy from the Dominion government arranged for at the time the island entered the confederation. See D. C. Harvey, *The French Régime in Prince Edward Island* (1926).

Prince of Wales Island. See PENANG.

Prince Rupert, a city of British Columbia, Pacific terminus of the Canadian National Railway, about 450 miles NW. of Vancouver, has facilities for a great port, and has been nobly planned, with provision for public buildings, squares, and parks, but development has been slow. Prince Rupert has sawmills, salmon and halibut fisheries, trade in grain, timber, and minerals. Pop. (1921) 6393. For Rupert's connection with Canada, see HUDSON BAY.

Prince Rupert's Drops. See ANNEALING.

Princes Islands, a beautiful group of nine islets near the eastern end of the Sea of Marmora, about 10 miles SE. of Constantinople, the largest being called Prinkipo. A favorite summer-resort of the Constantinople Greeks, they were in old times frequently a place of exile.

Prince's Metal, named from Prince Rupert, an alloy of copper and zinc, with more zinc than in brass.

Princeton, a borough of New Jersey, 50 miles SW. of New York. Pop. 6000. In 1777 it was the scene of a battle between the British under Colonel Mawhood and the Americans under Washington, in which the former were defeated; here the Continental Congress sat in 1783; and from Princeton Washington dated his farewell address to the army. Princeton, however, is chiefly celebrated as the seat of Princeton University, formerly the College of New Jersey, which, founded by charter in 1746, under the auspices of the Presbyterian Synod of New York, held its first commencement under its second charter at Newark in 1748. Liberal subscriptions were obtained both in America and in Britain, the Bishop of Durham being among the contributors, and the General Assembly of the Church of Scotland ordering a national collection. In 1756 the college was transferred to Princeton, on the erection of a hall named Nassau Hall in honour of William III. Within it hangs a portrait of Washington. It has had several distinguished Presbyterian divines for its presidents, as Jonathan Edwards and Dr. James McCosh. Since the civil war benefactions have poured in upon it. Among its graduates have been James Madison, fourth president of the United States, and many very eminent men. The theological seminary, founded in 1812, is the oldest of the Presbyterian Church in America. In 1896 the college became Princeton University. It has faculties of Arts and of Science, many laboratories and museums (especially for natural science), and a large library.

Principal. See AGENT, GUARANTY.

Principe, or PRINCE'S ISLAND, a Portuguese island in the Gulf of Guinea, forms a province with São Thomé. It produces cocoa, coffee, sugar, palm kernels, &c. Area of island, 45 sq. m.; pop. 5000.

Pringle, THOMAS, minor poet, was born at Blaiklaw (near Kelso), Roxburghshire, 5th January 1789. Lame from childhood, dyspeptic, devout, he went at seventeen to Edinburgh University, and found bread if not contentment of mind as clerk in the Scottish Public Records Office. He took to writing at an early age, and, besides other literary schemes and ventures, started the *Edinburgh Monthly Magazine*, the parent of *Blackwood*, in which his own most important article was on the Gypsies, from notes supplied by Scott. In 1820 he set sail with a party of twenty-four emigrants of his father's family for Cape Colony. He travelled into the interior with the party, and had his heart stirred within him to see the inhumanity practised towards the natives by English and Dutch residents alike. For three years he lived at Capetown as librarian of the government library at a salary of £75 a year. He started the *South African Journal*, and fought a brave fight for the freedom of the press. But he was bullied by the tyrannical and petty-minded governor of the day, Lord Charles Somerset, his schemes crushed, and himself reduced to poverty. He returned to London in 1826, and became secretary of the Anti-Slavery Society. He died in London, 5th December 1834. His *Ephemerides* (1828) was a collection of graceful verse. Those poems that related to South Africa—the best 'Afar in the Desert'—were reprinted in the volume of *African Sketches* (1834), a series of glowing sketches of South African scenery. Pringle's *Poetical Works* were edited, with a florid eulogium, rather than a life, by Leitch Ritchie (1839), and by W. Hay (1912).

Printing. Letterpress printing, or more strictly Typography, is the method of impressing any surface standing in relief on to paper, or any other suitable material, with the aid of some pigment such as a specially made ink, usually black, but sometimes in colour. This pigment is of a somewhat glutinous nature, and not liquid as writing-ink. The term printing covers many processes, and for our immediate purpose generally applies to impressions taken from type and all blocks standing in relief, such as wood-engravings and all illustrations made by photographic methods, either line or half-tone blocks, including stereotype and electrotype duplicate plates, whether of type or illustrations. Again, the expression printing may also be applied to lithography, offset-printing, colotype, copperplate, and even the various methods of producing printed cotton and other fabrics. In this particular article it is not necessary to give any details of these other methods, except to explain that we are dealing with the results obtained from surfaces that stand in actual relief, and not those employed for planographic processes, such as lithography, or the intaglio system, which consists of incised plates either engraved by hand or photogravure plates, mechanically produced, as their name implies. Intaglio is the reverse to the relief method, and the ink in this case is forced into the furrows resulting from the incisions made. When the plate is inked the surplus pigment is wiped off the surface of the plate, leaving only that remaining in the furrows. The paper under great pressure is then forced into the plate, which leaves the inked print slightly raised on the surface of the paper. This may be felt by passing the finger lightly over the printed object. On the other hand, all letterpress printing, being in relief, is indented, and the impression will be seen on the back of the paper, even if only faintly.

Among the Chinese it is said, during the 10th century, a first idea of printing took shape, and in China, indeed, the plan adopted a thousand years ago for certain kinds of work, i.e. pictorial designs, in some respects still prevails. It was not until some three or four centuries later that the Chinese employed some system of lettering for the printing of what may be termed descriptive matter, as distinct from mere pictures. For what we would call 'block-books,' which may or may not include some small amount of lettering such as titles or short descriptive matter, the Chinese usually employ pear-tree wood, which is cut up into boards of about half an inch thick, and these into blocks large enough for two pages of the book to be printed. The blocks are planed, squared, and sized or varnished. The design to be engraved is drawn or written on thin transparent paper, and transferred to the surface of the block by rubbing. The engraver next cuts away everything except the transferred pictures or letters. Labour being cheap, a block of this kind can be cut at about the same expense as it could be set up in movable metal types. For printing no press is used, the block being adjusted on a table, before which the printer stands, having a bowl of ink on one side and a pile of paper on the other. In his right hand he has two flat-faced brushes, fixed on the opposite ends of the same handle. One brush is dipped into the ink and applied to the face of the block, on which a sheet of paper is placed; the back of the paper is then swept lightly but firmly with the dry brush at the other end of the handle. This is all that is needed to fasten the ink on the paper—which is soft, thin, pliable, and quickly absorbent. Printing from movable types, it is said, was probably practised in China as early as the 12th or 13th century, and there are Korean books printed from movable clay or wooden types in 1317. The Chinese still prefer block-printing, but printing from metal types is becoming more general.

In the 15th century printing was first invented and practised in Europe. Before movable types were employed, which was in the latter part of the first half of that century, block-books after the Chinese fashion had been produced, and the first dated record we have is the picture of St Christopher, which is said to have been cut on wood in 1423. This was followed by several other block-books, and between 1430 and 1450 some of the most celebrated are the following: *Apocalypsis*, *Canticum Canticorum*, and *Biblia Pauperum*. All these were knife-cut plank-wise, usually on pear-tree or similar wood, whereas nearly all modern blocks are engraved on the end grain of box-wood with a graver which is a small V-shaped tool of steel. This explains the difference between a wood-cut and a wood engraving, so often confused.

The first introduction of movable types overlapped the later period in which these block-books were produced, and it is not clear whether the first separate types were cut on wood or cast in metal, and, if cast, what kind of metal was employed. Prior to the printing of the Gutenberg Bible at Mainz, about 1455, there were several very crude examples of printing turned out, particularly from Holland, but it is to Gutenberg (? 1400-1468) that is attributed the credit of being the inventor or at least responsible for the great improvement in the production of movable types and for the splendid craftsmanship displayed in printing his celebrated Bible, really the first big volume to be printed with movable types. With regard to the Dutch claim to the invention by Coster or Koster (? 1370-1440) of Haarlem, probably in the light of more recent researches he may have been the first to make some experiments, but these early examples of his work are rather poor, and will not bear comparison

with that of Gutenberg. For the last half-century or more many claims have, in turn, been separately advanced in favour of these two printers, but bibliographers of the present day are mostly inclined to give Gutenberg priority for the reasons stated above. Certain it is that the spread of printing throughout Europe was more due to Gutenberg than to Coster.

It has been said that First (or Faust), who had financed Gutenberg from the start, obtained by a law action possession of his premises and plant, and with the aid of Schoeffer, formerly an assistant to Gutenberg, carried on the original business, whilst Gutenberg obtained other monetary help and set up a second office. With two rival establishments in existence, it was not possible to keep secret the method of printing. In 1462 the city of Mainz was sacked, and this dissolving engagements between masters and workmen, many of the latter migrated to other countries, taking with them their knowledge of the art. Printing spread with marvellous rapidity, considering the many difficulties of transport and communication then prevailing. For instance, by 1500 there were nearly 80 different master-printers at work, and by the end of that same century approximately 200 in Europe generally. From Mainz the art of printing spread to Italy in 1465, to France in 1470, to Spain in 1474, to Portugal in 1487, to South America in 1536, and in the British Isles—to England 1477, Scotland 1507, Ireland 1551, Wales c. 1588.

It was William Caxton (q.v.) who first introduced printing into England. Having learned the art, it is said at Cologne and at Bruges, he came back to England and set up his press at Westminster within the precincts of, but not in, the abbey itself. Whilst at Bruges he had printed five books, but the first book he issued from Westminster was the *Dictes and Sayings of the Philosophers*, dated November 1477, which was followed by many other books too numerous to mention here. On his death he was succeeded by Wyken de Worde, his assistant, said to be a native of Alsace, whom he had brought over from Bruges (see WORDE).

The first hundred years of printing in England was a period of great activity. In 1478 printing was first practised at Oxford by Theo. Rood; in 1480 at St Albans by an unidentified printer, now called 'the Schoolmaster'; in 1521 at Cambridge by Sibberch. When the art had spread throughout the country, and education became more general, it was realised by the authorities that a power for good or evil had arisen. Then it was deemed necessary to regulate the press, and in 1530 censorship was established in England. This was followed by a period of decadence in the quality and quantity of printing. Printers were punished, especially during the existence of the so-called Star Chamber (q.v.); oppressed, abused, and often imprisoned, they lost all enterprise. Censorship was abolished in 1694, and then began a period of revival, aided by some improvement in typesetting in the middle of the 18th century. The 19th century saw some further development, following the invention in 1814 of the steam printing-press.

It was during the first half of this century that William Pickering (1796-1854), the eminent bookseller and publisher, was responsible for a marked improvement in book production, in which for some twenty-five years of his life he was assisted by the second Charles Whittingham (1795-1876) of the Chiswick Press. This association—Pickering with his unrivalled knowledge of early printing, and Whittingham as an acknowledged printer of good taste—resulted in an ideal collaboration which did much to create a higher standard in printing. The

closing years of the 19th century saw another revival in the work of William Morris (1834-1896) of the Kelmscott Press, founded in 1899, which has marked another stage. Since the Great War, 1914-18, printing has still more developed, especially as regards what may be termed fine printing, by the publication of much literature bearing on the subject, and also the creation of many new designs in type faces, many of which are based on those employed by old masters of printing, especially those of Italian or French origin.

Printing, as has been indicated, was introduced into Scotland in 1507. A patent has been discovered of King James IV., which shows that a printing press was established at Edinburgh at that date. This patent was granted to Walter Chepman, a capitalist, and Andrew Myllar, a bookseller, who had acquired in France the art of printing. The office was in what is now the Cowgate. As early as 1508 several small publications were issued. After these came the great work for which the press was mainly established—the *Aberdeen Breviary*, in two volumes, forming 1554 pages of small type. It was intended to become the standard Scottish service-book. Myllar had probably died before it was completed, and with its publication Chepman's connection with the press came to a close. For many years subsequently most works of Scottish authors were printed in France. The next printer was Thomas Davidson, who in 1541 was chosen to print acts of the parliament of James V., which constituted him the king's printer. Up to 1600 the average workmanship of the Scottish printers was as poor as that of their later successors has been distinguished for its excellence and accuracy. This is not the only feature of early Scottish typography. The printers were very few in number; for about 150 years after there were only about a dozen master-printers. During the first hundred years only twenty-five different works are known to have been printed in Scotland. See Dickson and Edmond's *Annals of Scottish Printing from the Introduction of the Art to the Beginning of the 17th Century* (Cambridge, 1890).

According to Cotton's *Typographical Gazetteer*, printing was not introduced into Wales until about 1588, but this is not certain, because a New Testament was printed and dated 1550 by John Oswen of Worcester, who was termed the king's printer for the principality of Wales, but it was probably printed outside the borders of that country.

The first printing press set up in America was introduced into Mexico by Antonio de Mendoza in 1536, and the first book printed in the New World was *La Escala de S. Juan Climaro*. The earliest press in the British-American colonies was brought over for Harvard College in 1638. The *Bay Psalm Book* (1640) was its first important work (see ELIOT, JOHN); but in 1639 it printed the *Freemason's Oath* and an almanac. The first press in Philadelphia was set up in 1685, and in New York in 1693.

In the article TYPEK will be found a full account of types and of the former methods of designing and casting of hand-set types, which are now being largely replaced by various mechanical contrivances, capable not only of producing cast type, but also of composing it according to 'copy' placed before the operators. Here it need only be said that types are cast in metal; that each single letter is about the height of a shilling, or, roughly, nearly one inch (see fig. 1); that types are to be obtained in a great variety of sizes, up to say one inch in metal, letters beyond that size usually being cut on wood by a pantographic method. The term 'fount of type' applies

to any one size or design, and consists generally of the plain Roman small letters (a to z), with certain tied or ligatured letters, and various accented letters; capitals and small capitals (Aa to Zz), with figures 1 to 0, and sundry accents, and also certain other signs or reference marks.

Having said so much, the actual practice of type-setting, and the intermediate stages leading up to the printing of the type matter, or technically presswork, may now be described with immediate reference to hand-set composition, though after a certain point all other technical details apply more or less to machine composition. The various hands employed in the several operations are the compositors, for setting type; readers, who are responsible for the reading and correction of all proofs; and printers (sometimes described as pressmen or more usually as machine-minders).

As in diagram now shown, types to be used in printing are laid in a pair of cases, which are divided into a series of 151 boxes in all. These cases are rested on a stand or frame, which brings them up to a proper height for the compositor. The lay-out or scheme employed for placing the letters in their respective compartments varies somewhat, especially for the capitals and figures, and that now given (fig. 2) is one specially employed for the

Upper Case.

Fig 2—Plan of Cases.

setting-up of this Encyclopedia. It will be noted that the small (or lower case) letters are laid in the bottom case, together with the necessary spaces and quads to place between the words or to fill up short lines, and that the vowels and those consonants more frequently used are placed as near as possible to the centre of this lower case in front of which the compositor stands. The object here is that his hand in picking up the several and separate letters gains speed in not having to reach too far for those letters in more frequent use, an important consideration, especially in those days when the compositor was more often paid on the piece-work system. The capitals, figures, and also accents (if required) are placed in the upper case. *Italic* founts are laid in separate cases.

The first step the young compositor has to learn is to acquire a perfect knowledge of the lay of these boxes, and to assume a correct attitude setting up types, which are picked up singly and placed in the composing stick: this is made of metal, usually iron or gun-metal, and held in the left hand, the right hand being left free to pick up the separate letters and to assemble them in the stick. To facilitate picking up these types, they

Fig. 1. before the operators. Here it need only

A Type, be said that types are cast in metal; that each single letter is about the height of a shilling, or, roughly, nearly one inch (see fig. 1); that types are to be obtained in a great variety of sizes, up to say one inch in metal, letters beyond that size usually being cut on wood by a pantographic method. The term 'fount of type' applies

are nicked on the front side of the letter as explained in the article on **TYPESETTING**. He picks up the desired letter from its box, and in conveying it to the composing-stick turns it to the proper position with the nick or nicks uppermost (fig. 3). In

Fig. 3.—Setting-up Type.

setting up poetry a uniform space is placed between each word. This also applies to prose matter, but in order to fill out a line of prose to its full width, without breaking the last word, it is nearly always necessary either to increase or decrease the spacing between the words of the whole line. Occasionally the last word, if it happens that it is a long one, is divided by placing a hyphen and carrying forward the remaining portion to the next line. Before justifying the line out to its full extent a careful compositor will read his line and amend any errors made. When the composing stick is filled the whole is lifted out and placed on to a galley usually made of metal, of various lengths, with a flange round three sides, which allows the type matter to rest safely against the lower side, and permits of it being locked or fastened up in order to have a proof struck off. This proof is then compared by the corrector of the press with the copy from which it was first set up, and all technical errors eliminated. This is termed the first or house proof.

Proofs are generally submitted to the authors on customers in slip or galley-form, and not so often in definite page length, except in the case of a reprint order. For a new work it is generally the custom to send out in this long slip form, because corrections, deletions, or insertions can be effected with greater facility than if proofs are submitted in page form.

The reader, or corrector of the press, as he is sometimes called, is usually one with a practical experience as a compositor, and noted for careful workmanship and clean proofs, possibly due to his general education being above the average, and a knowledge of languages is a valuable recommendation for the post. His position is one of responsibility, and the reputation of his firm depends greatly on him for the careful reading or revision of all work issued from that particular press.

When the technical errors have been cleared out in the house proof, clean proofs with the MS. are sent to the author or editor, who probably makes certain alterations or deviations from the first copy supplied. These are returned to the printer, the corrections made in the type, and further proofs are usually sent out again in page form of the desired length, with the headlines and page-folios inserted and arranged in sheets or signatures of a given number of pages, either in sections of 8, 16, or 32 pages, according to the precise size of the proposed printed book. Then if the book is, say, a crown 8vo ($7\frac{1}{2}$ by 5 inches), such as a novel, the pages are usually arranged in sections of 16 pages, and then laid down as two signatures of 16 pages each, thus constituting a 'forme' of 32 pages of type. In some cases, when the number printed is a large one, the forme may consist of four sections of 16 pages, making a total of 64 pages, this needing a sheet of paper of double quadruple crown, measuring 60 by 40 inches.

When the requisite number of pages have been made up they are laid down on the imposing surface—which stands on a strong wooden frame, rather above ordinary table height, and made with a planed iron surface—in a certain order so that when the pages are printed on both sides of the sheet they will cut up into sections and fold in complete sequence by the bookbinder. This is attained by adopting some recognised scheme of lay-out for the many and varied sizes of books. One small and simple instance is a sheet of 8vo = 16 pages in all, which shows (fig. 4) the actual type

Fig. 4.—A Scheme for Imposition

pages as the compositor would place them on the imposing surface; these when printed would appear in a reversed order. Similar schemes are adopted for sheets printed in larger sizes, and according to the number of pages contained therein. When the type pages have been arranged in correct order they are surrounded with either wood or metal 'furniture,' which gives the desired margin to the different pages, and then enclosed in an iron frame called a 'chase,' the whole constituting a 'forme' (fig. 5), which represents 4 pages of a quarto size.

Fig. 5.—Complete Forme with Chase.

After being securely fastened by the aid of wedges or 'quoins' it is rendered portable. After fresh proofs have been struck off, these formes may be stored in racks, and eventually, when any final corrections or alterations have been made, carried and placed on the particular press or machine fold off for printing.

Frequently stereotype or electrotypes are first made of type pages. This is advisable for long runs in printing numbers, because it saves wear and tear to ordinary loose type, which is an expensive item in the first cost of installing a printing plant—in fact, it is a continuous expense for renewals, unless mechanical type-setting is employed. In that case machine set types are usually printed from direct, and only when reprints are

likely to be called for are the pages stereotyped or electrotyped for future use. The type thus being liberated is then thrown into the melting-pot in readiness for other work.

But as regard hand set types, when finally disengaged, these have to be returned or distributed into their respective cases as required for further work. This is called 'distribution,' and a compositor does not usually attempt this until he has gained a complete mastery of the different boxes and can handle type carefully. By practice he will soon obtain speed and proficiency in dropping the letters into their proper receptacles; in fact it is possible to disperse 'dead matter,' as it is called, three or even four times more quickly than it originally took to set up.

The choice of the size of type depends largely on the size of the book to be printed, and also by the length of the MS. or copy supplied. For instance, an appropriate size for a quarto book would be, say, 12 point (pica), and for an octavo, 10 point (long primer), or even 11 point (small pica). Sometimes it is necessary to drive or spin out a work, which is done by 'leading' out the lines by thin strips of metal made of various thicknesses, and these are called 'leads.' If the lines are set quite close without leads, this is known as set 'solid.' Excessive leading is not advisable, for it gives a weak appearance to the page. On the other hand, if the printed line is a fairly long one, a little leading is less fatiguing in reading, and assists the eye in taking up the next line more readily.

So far we have been dealing with type-setting by hand, which still prevails to some extent for work of a commercial character, and also for some proportion of book-work. Machine-setting in the past was confined generally to newspaper work and to magazines. Owing to the improved designs now to be obtained in type faces and the greater facilities offered for mechanical type-setting, much more book-work is now being done each year. This can be carried out more expeditiously, and an unlimited quantity may be put into type whilst metal is available. With hand set types, which were usually limited, it was sometimes difficult to put any great quantity into type at one time.

Many experiments were made during the whole of the last century with various mechanical contrivances for expediting the composing of ordinary type, but none of these attempts were satisfactory; and although some of the systems lingered for some time, they have practically all dropped out of use. These machines employed existing loose types, but for some machines these types had to be specially nicked to facilitate distribution.

Of machines now in use for mechanical type-setting, it is only necessary to take two as examples, namely, the linotype and the monotype, which represent two quite different methods, both of which may be considered as almost perfect in their respective working. We say this without disparagement of other machines on the present market, to which we can give but a passing reference, but these follow on general lines one or other of the two systems now named.

The **LINE**TYPE, so named from the fact that it composes and casts as a solid slug a complete 'line of type' to any given width in any size or style of face selected; and a page or column is built up of lines, and not single or separate letters. The dual operations of setting and casting are confined to one machine and one operator only, with a keyboard similar to that of a typewriter. On compressing one of the keys, a brass matrix is released from the magazine, and slides down a groove or channel, and is assembled in the correct order by a travelling belt until the line is complete. The filling out of the line to the desired width is re-

gulated by the use of certain space-bands or wedges which are pushed up sufficiently to justify or fill out the line. The assembled line of matrices and space-bands are then carried to the face of a vertical mould and filled with molten metal, and so the complete line is cast and ready for the cutting knives for trimming the foot and sides in order to allow of the lines standing square and true in all respects. The finished lines are then conveyed to a receptacle called a galley. As soon as the matrices are disengaged they are automatically returned to the magazine, but the space bands are retained in the stationary box, situated near the assembly block. Whilst distribution is in progress, the composition of further lines is taking place. From this brief account it will be seen that the whole number of operations is under the sole control of one man. Given good 'copy,' it is said that it is possible for an expert to produce finished lines of plain straight-hand matter which would be equivalent to about 10,000 ems or more per hour, which means that number of separate letters, but for all-round work of the ordinary operators the average may be taken at least as 5000 per hour from fair copy. This machine also sets 'display' work.

Unlike ordinary hand set type, which becomes worn in course of time, the linotype produces each time a new and clean face for printing purposes, and, being cast in lines, is easier and quicker to handle in bulk, with less liability to 'accidents of the press' by not being in separate or loose single types. If there is no call for reprints the slugs are thrown into the metal pot for fresh work.

One of the advantages claimed for this machine is that it composes in almost any known language or character, and is employed in all civilised countries. Sundry improvements and various accessories are being continually announced, all of which add to the general utility and greater expedition of this machine.

The method adopted by the **MONOTYPE** is that of composing and casting in separate types. This allows of greater facility for making alterations or corrections in the matter. This system, although more or less automatic, requires two operators, one for the keyboard and one for the caster. There are certain advantages to be claimed for it over the slug method—one, which we have just referred to, concerns alterations or corrections. As the caster is quicker in its action than the keyboard, it is possible, where the installation is a large one, for a smaller number of casters to keep pace with the keyboards, and one attendant can run two machines, or even three, with the aid of a subordinate assistant.

The keyboard of the monotype, which is also similar to that of a typewriter, is used for the perforation of a paper ribbon, which controls the caster. As the keys are pressed, certain perforations are made in this paper strip. When finished, the perforated ribbon is transferred to the caster, and this machine is automatically controlled by the perforations made on this ribbon. By the agency of compressed air passing through these perforations two stops are elevated, one at right angles to the other. The object of these stops is to define the position to which a case containing 225 matrices shall be brought over a mould. Immediately the correct matrix has been brought into position, it is clamped to the mould, which has been meanwhile adjusted to the required width of the type to be cast, and molten metal is injected into the mould, resulting in a type being cast, correct in size, and bearing on its upper end the character required. A fine stream of water is passed through the mould to prevent it being overheated, and the metal in the mould instantly becomes solidified. The matrix is then

lifted from the mould, and, whilst the next matrix is being brought into position, the type previously cast is ejected and carried to a position where type after type is stored until the words and lines are complete. Each line is then carried to the galley, where they are accumulated until the galley is filled. When the type is finally disengaged it is melted down for new work.

As the monotype needs, in addition to the keyboard, a separate caster it is said that a competent keyboard man can operate about 12,000 ems or separate letters per hour, but the actual average may be taken as from 5000 to 7000 per hour; much, however, depends on the copy supplied. In this case, too, the machine is constantly being improved and added to. One other advantage is that the type produced by the caster can be used as hand-set types, and any particular letter running short can be separately cast to any requirement.

Two other classes of composing machines may be mentioned here whilst dealing with this section. Both are on the slug principle. The first is the **TYPOGRAPH**, which was introduced from the Continent some years ago, but, owing to the difficulty of obtaining renewals during the Great War, its general employment lapsed for a time. Except for some details, the main principles are those of other slug machines, but in this case the matrices are attached to steel runners, and are in view of the operators, and not enclosed in a magazine like that of the linotype. The matrices are set in motion by depressing a key on the board as in other composing machines, and the spacing is effected by a series of space-bands, plain on one side, with a helical face on the other, and a cylindrical boss, which expands by rotation, and thus justifies the line to its full limit.

The **INTERTYPE** is another and later development of this class of slug-casting machine, and in many respects is similar to the linotype. It professes to have certain advantages over others of the same kind. In designing this machine a policy of standardisation has been adopted, so that it is built up from a uniform base, and the difference between one magazine and a two, three, four, or even a six magazine is only a question of equipment. Thus a user is enabled to purchase a machine of limited equipment sufficient to meet his immediate needs, and build this up as his business grows. It is claimed that its capacities are greater than those of any other machine on the market; that it is lighter to operate, as the keyboard has been simplified; and it has also a greater range for the setting and casting of the slugs, besides many other improvements of the various parts in connection with assembling, spacing, casting, finishing, and distribution of the matrices into the magazine.

The **LUDLOW TYPEGRAPH** is a small and efficient slug-casting machine of American origin, and is a useful adjunct to composing-machines of a larger kind, and also for those printing-houses still employing the old method of hand-setting. It has been generally adopted by the newspaper press, and also by firms dealing with commercial work, chiefly for the setting and production of slugs necessary for the display-lines or headings of advertisements. The outfit of matrices offered by the makers includes a large variety of type faces in all sizes. Hand-set types of a jobbing or fancy character are usually limited and expensive to purchase, but by this particular machine an unlimited supply is to be obtained by the aid of comparatively few matrices, which are set up in a special composing-stick and cast in single lines.

Experiments are now being made with certain photo-composing apparatus, which, if successful, it is claimed will largely supersede the prevailing methods of hand and machine composition by

metal types. One difficulty we foresee is that of making corrections effectively.

Notable as have been the improvements effected in type-setting, it is in the press department of printing that greatest advance has been made. Particularly is this so in newspaper production, to which is applied the rotary system of printing.

There are three modes of impression in printing, and these are the platen (or flat), the cylindrical, and the rotary. The first presses were of the foremost kind, and the first known illustration of an old wooden hand-press dated very early in the 16th century, but the earlier presses were in the form of a wine or linen press. The illustration (fig. 6) shows a fixed bed, on which

Fig. 6.—Old Wooden or Common Press.

the type pages were laid, whilst the upper part, termed the platen, which was placed over it, was raised or lowered by means of a screw. When the surface of the type was inked, and the sheet of paper to be printed was laid over it, the top portion, made of solid wood, was screwed down until the two planes came into contact with the type and sheet intervening. The platen was then raised and the printed sheet released.

This press was modified from time to time, and Moxon, our first authority on printing, said in his work, *Mechanick Exercises*, 1683, that it was Blaeuw of Amsterdam who made about that date several valuable improvements in this wooden hand-press, which remained in general use until the latter part of the 18th century, when Earl Stanhope began making his experiments with the press which bore his name. This was made entirely of iron, and was actuated by a system of links and levers which allowed two men to print two hundred impressions per hour, an advance on that produced by the old wooden press, which was then termed the 'common press.' Later on, other improvements were made on Earl Stanhope's design. This was followed by the Columbian press of American design, which was also of iron, and of more solid and powerful build. This was followed also, about 1823, by the Albion press, made by Cope of London, which for hand work still retains its popularity. It was this particular kind that was adopted by William Morris when setting up his Kelmscott Press. Some of these hand-presses were made specially strong in order to deal with the heavy work demanded by his famous edition of Chaucer, which contained many large woodcuts designed by Burne Jones. Except for the printing of very short runs, or for the pulling of proofs, or for the production of fine limited editions (or editions de luxe), these presses are now rarely used, and are chiefly employed by the few private presses that came into vogue with the death of Morris in 1896 and the closing down of the Kelmscott Press in 1898.

These hand-presses required quite a different method of working and also a different system of 'making ready,' which is a necessary preparation before beginning to print. Moreover, these presses involved much manual labour and were slow in production, which is not to be tolerated in these days. The modern power-presses, whether for sheet or web printing, have now been improved so very much that with the requisite skill they will produce work equal to, and in some classes even better than, that given by the old hand-press.

To trace the evolution of the hand-press into the power-driven machine of to-day it is necessary to go back to the end of the 18th century. It has been claimed that William Nicholson of London must have derived some of his ideas for the construction of a printing-machine—this was about 1790—from one patented in 1772 by Adkin and Walker for printing on calico and other textile fabrics. The principle adopted by these two men was that of the rotary system, which Nicholson to some extent adopted. He was not a printer, but simply an editor, and he never reached any stage beyond the designing of the machine. Curiously enough, many of the points he suggested in his patent of 1790 foreshadowed those embodied in some modern printing machinery.

It is to Friedrich König that credit is due for the actual making of a printing-machine. He came from Germany in 1806, and his first experiment was with the platen method. His idea was to accelerate the speed and make more automatic the production of the hand-press. The result was not at first encouraging and never put into general use. About this time it is assumed that he must have been impressed with Nicholson's suggestions, and, abandoning his former and somewhat crude ideas of the flat impression, he in 1811 took out a patent for a machine, consisting of a single cylinder, on which the paper was impressed as the bed on which the type was placed travelled to and fro—the sheet being printed as the bed went forward, and the cylinder remaining stationary on the return, very much on the same principle as the modern stop-cylinder, which is distinct from the two-revolution machine.

This second attempt of König's was more successful, and John Walter of the London *Times* gave him a commission to build for him a double-cylinder machine. This was completed in 1814, and steam power was first adopted in that same year by the *Times* for driving that machine, which produced about 1000 impressions per hour on one side only. König was still busy with new ideas, and shortly afterwards he patented another machine consisting of two large cylinders which faced each other. This has been termed a 'perfecting machine,' from the fact that the sheet after being printed on the first side was carried by tapes and reversed in its progress so that it was presented to the second cylinder for the printing of the second side. It was in 1818 that Edward Cowper made several improvements on this machine, which included a flat ink-distributing table, a distinct advantage, still employed for single or double cylinder machines. This machine, later on, was still further improved, and produced about 750 perfected (i.e. backed) copies per hour. Many of the original features are still retained in the more modern examples of this class of machine, and also rendered more speedy. One recently put on the market by the Linotype and Machinery Ltd. is said to produce 1600 perfected copies per hour.

For many years most book-work, and chiefly that of a commercial character, has been executed on what is generally known as the WHARFEDALE or single cylinder on the stop principle. This followed the 'Ulverstonian' machine, built about 1853 by

Soulsby, with a revolving and travelling cylinder which passed over a fixed type-bed, but the Wharfedale reversed that action by adopting a fixed cylinder revolving on stationary journals with a reciprocating type-bed. This was first introduced about 1860 by William Dawson and David Payne of Otley in Yorkshire, and its name was derived from the local dale through which the river Wharfe runs. These machines, of which there were several variations, had a great vogue for many years, and are still much in use in different parts of the world. Both English and American makers have added many improvements to the original specifications. These include better inking facilities and various automatic arrangements for delivery of the printed sheets.

The cylinder, a hollow drum, has an opening in its under side, and is placed approximately in the centre of the machine. The table or carriage on which the type-forme is placed has racks underneath, geared into traverse-wheels and driven by a crank motion from the driving-wheels, and from those traverse-wheels the reciprocating table motion is derived. Racks on top of the table cause the cylinder to rotate, thus giving the impression to the forme. The inking system is placed at the extremity of the machine, and across it a duct or ink-reservoir, with an adjustable knife, which regulates the outflow of ink. A roller in motion, called a vibrator, takes a film of ink periodically and transfers it to the ink-table, which forms part of the carriage, and travels backward and forward. The ink is evenly spread over the ink-table by distributing-rollers. The table then passes under the inking rollers, which give the forme the proper coating of ink. The various rollers are coated with 'composition,' which is of a resilient nature, and is referred to on page 391. The feeding apparatus is situated at the other end. A pile of paper is placed on the laying-on board, and the feeder stands at the side of it and lays the sheet down until the edge of it comes in contact with the front and side marks, when a series of metal fingers, called grippers, open, and take a sheet by its front edge, and hold it secure while the cylinder is revolving and the printing taking place. At a certain point the grippers release the sheet, which then passes into the taking-off apparatus, from which, by various devices, it is deposited on the delivery-table with the printed side uppermost. The cylinder, on the return of the forme-carriage, is stopped, the necessary locking being performed by a push-rod worked off an eccentric cam placed on the lower part of the frame, which pushes the cylinder back to a dead stop. The inking and distributing powers are a great feature of these machines, likewise the accessibility of all parts and the convenience in laying on and taking off. They are simple in construction, and occupy little space. The 'Standard' Wharfedale of Messrs Dawson, Payne, and Elliott, Ltd., is made in many different sizes, and the smallest is guaranteed to run at 2600 and the largest at 1500 copies per hour by hand feeding, but those fitted with an automatic feeding apparatus will produce greater numbers.

Soon after the introduction of the stop-cylinder machine a small PLATEN machine was invented by an American named Gordon. This was made exclusively for small jobbing work, and it was first actuated by a foot-pedal, but afterwards, when made in larger sizes, provision was made for driving by power. An endless variety of these small and useful machines are now to be obtained. They occupy little floor-space, and, according to size, will print anything from a card up to a sheet measuring 22½ by 17 inches—larger sheets are not usual. The operator both lays on and takes off the printed

sheet or card, and the output is at least 1000 an hour. Some machines are speeded up to produce more, but the number given, unless some automatic arrangement for feeding or taking off is used, is safe if these operations are performed by hand. This machine needs only a small, square floor-space. It usually consists of two parts—the bed and the platen; and the main principles are that the bed which holds the type-forme is placed in a fixed vertical position, and the inking arrangements are placed at the back and near the top of this half of the machine. The other portion which forms the platen, on which the sheet to be printed is laid, is, when at rest, almost horizontal, and when set in motion this platen rises and meets the fixed bed containing the type forme, and the impression is given to the intervening sheet. The platen then falls back into its original position, and the printed sheet is removed and another laid to certain marks, ready for the next impact. In the interval the overhead inking arrangements pass over the type-forme, the ink being first distributed by either a revolving disc or a cylindrical drum. These handy machines relieved the old hand-presses of much of the smaller work, being much more expeditious and much less expensive in working. They are also exceedingly useful as a supplement to the cylinder-machine department in dealing with oddments of printing and miscellaneous work of a jobbing character.

The so-called colour machine, first made in this country on the stop-cylinder principle, consists of one cylinder and two separate inking arrangements, and is adapted for long runs in red and black, for example. The two ink-driets and the necessary rolling, with the two separate formes for printing, are arranged at each end of the machine, and the carriage or bed of the machine is sufficiently long to carry the two formes to be printed, both the feeding and delivery being made in the same way as the ordinary one-colour stop-cylinder. The cylinder makes two revolutions forward in order to receive in turn the two colours, and on the return of the carriage, or bed containing the two type-formes, the cylinder remains stationary. One other system of printing is based on the two-feeder plan, which increases the output.

The Wharfedale 'stop' machine has, to some extent, been superseded by those built on the two-revolution system, which is of American origin. Of this class the MIEHLE is a good example, and the principle is now being applied more generally by other makers in this country. The chief character of the two-revolution machine is that it has a non-stop-cylinder, which is continually rotating whilst the machine is in motion. The cylinder rotates in the same direction twice for each copy given—once for the actual impression, and, secondly, for the return of the forme-carriage, which is arranged for by special gearing, thus avoiding the stationary pause of the cylinder. This method, combined with sundry improvements and certain accessories, renders it a faster and more accurate machine than the ordinary stop-machine. The feeding board is placed overhead, and not on a level with the bottom of the cylinder. Its solid construction gives it a more rigid frame, and it is claimed that this point, together with greater accessibility to the different parts of the machine, reduces the time usually spent in making ready for the running, particularly for work containing illustrations in one or more colours.

As stated previously, the newer varieties of machines do not require so much preliminary preparation or 'making-ready' for printing as formerly, because the frame, or bed plate, and other parts are now so much more rigid and more truly finished in all respects. But even now a

certain amount of time must be given to this necessary work, in order to obtain uniformity of impression and evenness of inking—this is specially desirable for books or magazines that include process-blocks as textual or separate illustrations. These may be either line or half-tone blocks, and the latter usually require greater care. To arrive at the uniformity required it is necessary to bring the type up to an absolute level by patching up a trial minked sheet pulled for impression only, and to turn that sheet upside down in a good light to see the result of that impression. Where the letters appear low, very thin paper is pasted on the impression sheet, and where they stand high, pieces are cut out. Usually if blocks are included in the type pages they are found to be low. In that case it is customary first to underlay them so as to bring them up to the height of the surrounding type—this is done before the inequalities of the type are dealt with. When this is done, and the sheet pasted up into its proper place on the impression cylinder, another trial sheet is pulled, and sometimes a third one is necessary, all of which are fastened up on the cylinder, or the pages may be cut out singly from the sheet and pasted up separately, which is the more usual plan. If the type is new and the machine in fairly good order, making-ready will, of course, not involve so much trouble as if type and machine are both somewhat worn. Illustrations in the text demand special attention in bringing out light and shade in each separate block, and to do this properly will test the artistic appreciation of the workman. This is carried out by a more elaborate overlay to each illustration, and is greatly assisted by correct underlaying in the first instance, as already explained. All this being carried out as detailed, and the requisite amount of ink regulated to the requirement of the work in hand, evenness of both impression and inking should result. In the rotary system of printing now to be considered, as distinct from the platen and cylindrical methods, little or no making-ready is required.

ROTARY printing is used mostly for newspaper production, but occasionally for magazines and the more ordinary kinds of book-work of large issues. It is here that the greatest improvements in printing practice have been made since the middle of the last century. Messrs Hoe of New York constructed for the *Times* newspaper in London a ten-feeder machine, which was considered an improvement on previous experiments of the rotary character, but the feeding arrangements involved much manual labour, and the rate of production was slow. Out of this, in 1866, evolved the Walter press, which was the first to adopt stereotyped curved plates to fit the type cylinder, and printed direct from the web or reel of paper. This dispensed with the large number of hand-feeders and expedited the printing enormously. It is said that this new machine produced 10,000 perfect sheets per hour, the equivalent of 20,000 impressions. To the Walter family all credit must be given for this and some subsequent improvements made. This Walter press was adopted as a basis by other manufacturers, not only here, but also in other countries. Many subsidiary arrangements were added from time to time, one of the first being automatic folding.

As a result, other machines on the rotary principle have been put on the market, equally good but differing from each other in details. In striving to attain further improvements, it has generally happened that some other good feature had to be sacrificed in the process.

The more technical descriptions usually applied to the various rotary machines are generally confusing to the ordinary reader. The difference between a single and a double width of machine

should first be noted. The former prints from the reel or web of paper two news pages wide, the latter four pages wide, and this double width is slit with a revolving circular knife before it reaches the folding apparatus. Again, the larger machines are arranged in decks, and duplicate presses, according to the designation of the particular machine, are collectively employed. For instance, a single octuple is made up of two presses on each deck situated at both ends of the machine, which constitutes four units in all. Each separate press prints both sides as the web of paper passes through, and when it is slit, cut, collated, and folded it is carried to the delivery fly situated in the centre of the machine. Quadruple and sextuple machines are limited to the number of presses indicated by their names.

As an example of a rotary machine, a double octuple (consisting of eight single presses) similar to that employed at the *Times* office, and made by the firm of Messrs R. Hoe and Co. Ltd., occupies a floor space 56 feet long by 9 feet wide, which measurement does not include either the outside staircases or the reels situated at either end, but merely the bed-plate of the machine; the height of the decks is about 18 feet. The paper is fed in from both ends, and the four folders are situated in the centre on both sides where delivery is made, thus forming, as it were, a double machine of double width. As the machine is speeded to run 15,000 revolutions per hour, its full capacity at that rate will produce 60,000 complete copies of a newspaper, consisting of 32 pages printed from four duplicate sets of stereotype plates, and the copies are slit, cut, and collated before reaching the folders, each separate and complete copy being delivered folded in half and counted off in quires. A pasting accessory may also be employed if required. If the issue consists of 24 pages only, the upper deck at each end is thrown out of use. Each reel contains about five miles of paper, and as exhausted may be easily and quickly replaced by fresh reels by means of an overhead electric hoist. Each single press may be said to be arranged in a vertical pile, with the inking appliances at the bottom; in the centre are placed, side by side, the two plate (printing) cylinders, and immediately on the top the two blanket (impression) cylinders, through which the paper passes for the printing of the first and backing sides. As the web is unwound from the extreme end of the machine it passes under the press, and is carried up the centre of the pile until it reaches the first plate cylinder, with its corresponding blanket cylinder above it, for the first impression. It is then conveyed to the next pair of facing cylinders for the reverse to be printed. From there it is cut and folded as already mentioned, and placed on the delivery fly. By the aid of certain smoothing rollers the web of paper is kept flat and taut in its progress. All this is repeated with the other seven separate presses forming the octuple. Save for a limited amount of skilled and certain other manual labour, the running of this complex machine is entirely controlled by the simple pressing of an electric button.

A useful adjunct for expediting newspaper work is stereotyping by the AUTOPLATE (see STEREOTYPING), which is an automatic machine for producing curved stereotype plates for rotary machines. After the type pages have been moulded and dried, these moulds are placed in the casting apparatus, and in a few minutes perfect plates are turned out ready for fixing on the printing cylinders, with as many duplicates as required.

Machine-made paper is now manufactured in much larger sizes than formerly, and, as a result, printing-machines are laid down to cope with the

larger sheets. The old hand-presses, especially the wooden ones, could only deal with quite small sheets; the first iron presses practically doubled the size of the sheet. Later developments of these hand-presses slightly increased the size, and the earlier power machines, whether platen or cylinder, handled paper of even larger dimensions. In addition to rotary printing from the web or reel, flat printing-machines have been adopted to take not only papers in quadruple, but in double quadruple, sizes up to 50 by 80 inches, which means expedition and the cheapening of production.

The old method of inking employed balls. The workman held one in each hand and dabbed the surface of the type, whilst his companion at the hand-press laid on the sheet to be printed. These balls were made of pelts, and the stuffing inside usually of wool. Rollers came into use soon after the Stanhope press was invented in 1800, and were absolutely necessary for the first printing-machines of cylindrical design. The present constituents of the roller for all printing-presses are mainly trezele, glue, and glycerine, the proportions varying with the different makers and according to the particular class of press or machine for which they are needed. These rollers are cast in iron moulds to standard sizes.

Ink consists of a varnish made of boiled linseed-oil with the addition sometimes of a little resin and occasionally soap. For colouring matter lamp-black is used, which may be intensified with the addition of a little blue. This is a compound for the best kind of work, such as that used for good book-work. For cheaper inks many other substitutes of a chemical nature are used, but they are not permanent.

It has been mentioned already that an automatic system of delivering the printed sheets was applied to some of the early cylinder machines. This is still in use for certain machines, the operation usually being performed by the aid of a small wooden drum or cylinder placed near the larger printing cylinder. As printed, the sheet is seized by other grippers attached to this secondary drum from which it passes to the endless travelling-tapes, and is then conveyed to the delivery board and the printed sheets placed face upwards on the pile. The later kinds of cylinder machines have different systems of delivery.

Automatic feeding has been in the past a greater problem, owing to the many differences in the size, substance, and the surface of the sheets particularly. There are now several methods in use which answer fairly well and can deal with most varieties of paper supplied to the printer. The method generally adopted is that of suction. In connection with these automatic appliances a recent addition is the 'pile' system of feeding and delivery, useful for works of long runs. This allows of the unprinted paper and printed sheets being handled in bulk by special trucks being wheeled into position. The working is automatically regulated by overhead gearing. One great advantage is that any premature handling of freshly printed sheets is avoided.

Steam power was applied to printing in 1814, and much of the present development of the craft has been due to that system of driving. But it was a cumbersome method, involving much valuable space for engine and boiler, and expensive to run. It created dirt or dust, and needed much attention. The introduction of the gas engine for small or medium requirements was a great boon. It was economical to drive, could be started and stopped readily, and required little space and less attention. We may now consider electricity as the ideal power in all respects. It is clean, not expensive, occupies wall-space only, and is extremely handy.

It can be used to drive groups of machinery, but the better way is to adopt independent driving. This means a separate motor for each machine, the power being regulated to the size of the machine. This in itself is a great advantage, because the machine is only consuming power whilst running. In addition, this method entirely dispenses with all overhead shafting and belting, which, when in motion, raises some amount of dust detrimental to both workers and work, and at the same time increases the risk of accidents. Again, to have a variety of machines of different sizes deriving power from the same shaft has an unsatisfying effect on some.

At ILLUSTRATION OF BOOKS and PHOTOGRAPHY will be found an account of the several processes of reproduction, which include collotype, photogravure, and other methods. But much colour-work is still done by the letterpress system by the use of the three primary colours, which has created a demand for printers proficient in this class of work. Good blocks are necessary, and also suitable inks. Making ready is carried out in much the same way as for ordinary half-tone blocks printed in a monotone. Absolute dead register is essential, and this depends largely on a perfectly rigid machine being selected for dealing with this class of work. Yellow is the colour first used, followed by red, and lastly by blue. Occasionally a fourth colour, usually a neutral gray, is employed to give greater effect to the whole picture. Offset-printing is another method sometimes used for colour-work, but that process usually falls under the head of Lithography (q.v.). Some very good and soft effects are to be obtained by this new method.

Some very curious customs still prevail in the printing trade, some of which have been handed down since the time of Caxton, and these are mentioned in Moxon's *Mechanick Exercises* of 1683, to which work we have already referred. One important custom is that of the so-called 'Chapel.' In the larger offices every department has its own chapel (and these combined are termed an 'imperial' chapel), and the men employed in each form themselves into what may be described as a committee, which meets occasionally to discuss matters generally under the guidance of the 'father,' who is assisted in his work by a 'clerk.' Many of the technical terms still employed by printers have been handed down from the incunabula period, and derived from various classics and also from ecclesiastical sources. For instance, certain sizes of types were named after the works they were first put to, such as Pica, Primer, Brevier, &c., the meanings of which are obvious. To mention two terms only—'friar' and 'monk' are still used. The first denotes a white patch in a printed page, and the latter is one applied to a black (or dirty) patch.

Prior, Priory. See MONACHISM, MONASTERY, ABBOT.

Prior, MATTHEW, was born 21st July 1664 at Wimborne Minster in East Dorset. His father was a joiner, who, coming to London, took up his abode in Stephen's Alley, Westminster. Young Prior went to Westminster School, then under the redoubtable Dr Busby. His father died, and his mother being unable to pay his school-fees, he fell into the care of his uncle, a vintner in Chancel (now Cannon) Row, who took him into the bar to keep accounts. Here his familiarity with Horace and Ovid attracted the attention of Charles, Earl of Dorset, and other visitors to the Rhenish Wine House, with the result that he returned to Westminster, his uncle finding him in clothes, and Dorset in books. At Westminster he formed a life-long friendship with the two sons of the Honourable George Montagu, the elder of whom afterwards became Earl of Halifax. In order to follow his friends to Cambridge, Prior, against Lord Dorset's wish, accepted a scholarship from the Duchess of Somerset at St John's College. He was admitted Bachelor in 1686, and in the following year wrote with Charles Montagu the clever parody of Dryden, entitled *The Hind and the Panther transvers'd to the Story of the Country-mouse and the City-mouse*, which, according to tradition, greatly annoyed Dryden. In April 1688 Prior obtained a fellowship; and his composition of the yearly college tribute to the Exeter family, a rhymed excursus upon Exodus, iii. 14, led to his going to Burleigh as tutor to Lord Exeter's sons. Lord Exeter shortly afterwards removed to Italy, and Prior applied (through Fleetwood Shephard) to his former patron Dorset for advancement. He was, being then twenty-six, made secretary to Lord Dursley, afterwards Earl of Berkeley, then going as ambassador to the Hague. In Holland Prior remained some years, finding especial favour with King William. In 1697 he brought over the Articles of Peace at the treaty of Ryswick; and, after being nominated Secretary of State for Ireland, he was made secretary in 1698 to the Earl of Portland's embassy to France, continuing this office under the Earl of Jersey. In this capacity he found favour with Louis XIV. In 1699 he became an under-secretary of state; in the following year Cambridge made him an M.A., and he succeeded Locke as commissioner of trade and plantations. In 1701 he entered parliament as member for East Grinstead. Under Anne he joined the Tories, and in 1711 was employed in the preliminaries of the peace of Utrecht, going to Paris as ambassador in the following year. With the queen's death in 1714 came the triumph of the Whigs, and in 1715 Prior, returning to England, was impeached and imprisoned. In 1717 he was excepted from the Act of Grace, but was, none the less, subsequently discharged. The remainder of his life was passed partly at Down-Hall in Essex, a country-house purchased for him by his friend Lord Harley, to whom he entrusted the profits of a subscription edition of his poems, and partly with Lord Harley, at whose seat of Wimpole he died, 18th September 1721, being then in his fifty-eighth year. He was buried in Westminster Abbey, under a monument decorated with his bust by Antoine Coysevox, given to him by Louis XIV. His portrait was painted by Richardson (National Portrait Gallery), by Belle (St John's College), Kneller, Dahl, and others.

Of Prior's abilities as a diplomatist there are diverse opinions. Pope sneered at them. But Bolingbroke and Swift extolled them; and it is stated that the archives at Paris show him to have been far abler and more resourceful than is generally

supposed. As a poet, in which capacity he is now remembered, he holds a unique position. Without much real sentiment or humanity, his verses have a wit, a grace, a neatness and a finish, which link him to the lighter Latin poets on the one hand, and to the best French writers of familiar verse on the other. Cowper praised his 'easy jingle,' Thackeray 'his good sense, his happy easy turns and melody.' He collected his poems, described by himself as consisting of 'Publick Panegyrics, Amorous Odes, Serious Reflexions, or Idle Tales' (many of which had been contributed to Dryden's and other miscellanies), in 1709, and again, in extended form, in 1718. By this latter issue he made £4000. His more ambitious pieces, *Solomon on the Vanity of the World* and a paraphrase of the old ballad of the *Nut Brown Maid*, are not now thought to be his best, although they had considerable popularity with the readers of the 18th century. But a third long poem, *Alma; or, the Progress of the Mind*, an imitation of Butler, is full of wit and waywardness. His *Tales* resemble the French *contes* too much in their objectionable qualities to be palatable to the English taste. He survives mainly by his purely playful efforts, his lyrics and his epigrams, not a few of which are unsurpassable. In the kind of piece known to the French as *vers d'occasion* he is unrivalled, and his beautiful stanzas to *A Child of Quality* have been as fortunate as Gray's *Long Story* in setting the tune to a host of versifiers. In 1740, long after his death, two volumes were published, one containing alleged *Memoirs*, in which there is little of his, and the other a number of posthumous verses, among which are some of his best. See his *Selected Poems*, edited by Austin Dobson (Penguin Library, 1889), *The Shorter Poems*, ed. F. Bickley (1923); an article by Mr G. A. Aitken in the *Contemporary Review* for May 1890; the editions of Prior's works by R. Brimley Johnson (2 vols. 1892), and Waller (1905-7); his *Life* by Francis Bickley (1913); L. G. Wickham Legg's study (1921); and the *Prior Papers* published by the Historical Manuscripts Commission in vol. iii. of the Marquess of Bath's Collection (1904-8).

Priscian (Lat. *Priscianus*), surnamed CÆSARIENSIS, born or educated in Caesarea, is in point of reputation the first of Latin grammarians; his treatise was in universal use as a text-book during the middle ages. Paulus Diaconus calls him a contemporary of Cassiodorus (468-562 A.D.). He taught Latin at Constantinople, and enjoyed a government salary. The work which has preserved his name is his *Commentariorum Grammaticorum Libri XVIII*. The first sixteen books treat of the different parts of speech; the remaining two of syntax. The work shows great learning and good sense, and contains quotations from many Greek and Latin authors no longer extant. Priscian also wrote six smaller grammatical treatises, and two hexameter poems of the didactic sort, *De Laude Imperatoris Anastasii* and a free translation of the *Periegesis* of Dionysius.

Priscillian, the chief propagator of the doctrines professed by the sect known from his name as Priscillianists. They spread widely in Spain during the last third of the 4th century, and lingered there till the middle of the 5th century. The first seed of their doctrines is said to have been carried into Spain by a Memphian named Marcus, whose earliest disciples were Agape, a Spanish lady, and Helpidius, a rhetorician. Priscillian was a man of noble birth, pious and well educated; and his eloquence and nobility of character soon gathered round him a group of devoted followers, including two bishops, Instantinus and Salvianus. From their hands he received episcopal ordination,

and he established his see at Ávila. Hyginus, bishop of Córdoba, was the first to take alarm, but his measures were so gentle that he himself was covered with reproaches by the ultra-orthodox and fanatical. Priscillian's most determined enemies were Idacius, bishop of Emerita (Mérida), and Ithacius, bishop of Sossoba. He was condemned and excommunicated at the synod of Saragossa (381), with three others of the leaders of the party. They next went to Rome to clear themselves before the pope, but were denied audience, and at Milan on the return journey they met as little sympathy from Ambrose. Under the vacillating rule of Gratian, however, they prospered, but their hopes were dashed to the ground by the usurpation of Clemens Maximus. From the judgment of the synod of Bodeaux (384) Priscillian appealed like Paul to Caesar, and was at length summoned to appear at Trier. Martin of Tours was in favour of tolerant measures, but after his departure the fanatical party prevailed, and Priscillian, with others of the party, was condemned and put to death—the first who suffered death for heresy (385). Many Priscillianists recanted after the synod of Toledo (400), and soon after that of 447 they disappear altogether. Their doctrines contained Manichaean and Gnostic elements, strange cosmical speculations based on primitive dualism, the doctrine of emanations and astrological fatalism. They practised rigid asceticism, and eschewed marriage and the use of animal food. One damning blot on their morals was that absolute veracity was only obligatory between themselves. Graver charges still were made against their morality; but it should be remembered that the only accounts we have are those of bitter enemies, and their principles, originally obscure enough, have been made darker by a cloud of calumny. 'If the Priscillianists violated the laws of nature,' says Gibbon, 'it was not by the licentiousness but by the severity of their lives.'

See Mause's *Gnostic Heresies* and Neander's *Church History*; books on Priscillian and Priscillianism by Mandernach (1851), Schepss (1886), Paret (1891), Babut (1909); and Morin, *Études, textes, découvertes* (1913). Schepss claimed to have discovered some of his writings; these he edited in vol. xviii. of the *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna, 1889).

Prism, in Geometry, a solid figure which can be most easily conceived of if we imagine a number of plane figures (triangles, quadrilaterals, &c.) exactly similar in form and size to be cut out of paper or any thin plate, and piled one above the other, and then the whole pile to become one body. It will thus be seen that the top and bottom of the prism are similar, equal, and parallel to each other, and that the sides are plane figures, rectangular if the prism be 'right' (i.e. if in the above illustration the pile of plane figures be built up perpendicularly), and rhomboidal if the prism be 'oblique' (i.e. if the pile slope to one side); but under all circumstances the sides of a prism must be parallelograms. The top and bottom faces may be either triangles, squares, parallelograms, or quadrilaterals of any sort, or figures of five, six, seven, &c. sides, provided only both are alike; and the number of sides in the plane figure which forms the top or bottom of course determines the number of faces of the prism; thus, in a triangular prism, there are five faces in all (three sides and two ends); in a quadrangular prism, six faces (four sides and two ends), &c. If two prisms, one being 'right,' and the other 'oblique,' have their bases of equal area, and be of the same vertical height, their solid content is the same, and is found by multiplying the area of the base by the vertical height. The parallelepiped is a quadrangular prism, and the cube is a particular case of the parallelepiped.

PRISM, in Optics, is a triangular prism of glass

or other transparent substance, its two ends being isosceles triangles, or it may be a prism-shaped glass container filled with a liquid or with a gas. The prism is a most important instrument in experiments on the refraction of light, and, in the hands of the most eminent optical philosophers, has been the means of largely adding to the science of optics. See OPTICS, REFRACTION, SPECTRUM.

Prisoners of War are those who are captured from the enemy during naval or military operations. By the laws or recognised principles of war, the entire people of a vanquished town, state, or nation become the absolute property of the victors. In ancient times the treatment of prisoners of war was very severe. In the Greek wars it was no uncommon thing to put the whole adult male population of a conquered state to the sword, while the women and children were enslaved. Although the putting to death of prisoners became less frequent, they and their families were commonly reduced to slavery to as recent a period as the 13th century. The act of Napoleon in putting to death the Turkish prisoners of war at Jaffa in 1799 was universally condemned, and is probably the last instance of such barbarity. Notwithstanding frequent exchanges, large numbers of prisoners accumulate during war.

Prisons are places of confinement normally for criminals or malefactors, in some cases and places also for debtors and political prisoners; and imprisonment as a procedure by means of which high objects are to be attained ought to be conducted according to a defined system founded on recognised principles. It used to be believed that nothing more was required than to ensure the security of the victim or culprit, by chains and fetters if necessary, unless it were to inflict on him some further bodily pains and penalties, the smallest of which was to feed him with 'the bread of affliction and the water of affliction' ordered by Ahab for the prophet Micaiah. Imprisonment was not mentioned in the Anglo-Saxon laws as a punishment, but was enforced when an offender could not find a surety. In course of time, however, it was authorised by the common law as a punishment, as well as specified by statute for particular offences; nevertheless gaols were actually used more for securing the persons of those committed to them than as places of punishment. Under the common law all gaols belonged to the king, and by 5 Hen. IV. chap. 10 it was enacted that none but the common gaol should be the place of committal for offenders brought before a justice of the peace. But there were many 'franchise' gaols owned by great persons, or by towns and liberties under their charters, which were lawful places for carrying out imprisonment ordered by the persons or bodies to whom these privileges were granted as a part of the criminal jurisdiction placed in their hands. In many cases these bodies had the power of life and death.

In the reigns of Edward VI. and Queen Elizabeth a new description of place of confinement was introduced—viz. the 'bridewells' and 'houses of correction' for vagabonds, &c. By 7 James I. chap. 4, every county was required to provide such an establishment with suitable instruments and appliances in it for setting idle people to work.

To-day prisons are of two kinds—(1) Convict prisons, where persons sentenced to penal servitude are confined. (2) Local prisons, where persons sentenced to ordinary or simple imprisonment are retained.

The punishment of penal servitude had its origin in the system of transportation, and transportation itself had its origin in banishment or exile. This was expressly forbidden by Magna Carta, but

existed nevertheless as a practice, because a criminal who had incurred the sentence of hanging and had taken sanctuary to avoid his fate was permitted in some cases to escape his punishment if he exiled himself. In course of time the privilege of sanctuary was abolished by law (though its practice existed notwithstanding for some time afterwards), and consequently the system of self-banishment which grew out of it; but before then—viz. in the thirty-ninth year of Queen Elizabeth's reign—banishment had been legally established by the Vagrancy Act, which gave quarter sessions the power of transportation.

Transportation was sanctioned by law in the reign of Charles II. as a mode of dealing with incorrigible rogues, vagabonds, and sturdy beggars, as a punishment for attending an illegal prayer-meeting after a previous conviction of that offence, and to put down the moss-troopers of Northumberland and Cumberland. The transportation was not at first enforced by any direct action of the government, but those sentenced to it were left to carry out their sentences by removing themselves to the West Indies or elsewhere under penalty of hanging if they failed to do so; but in course of time the process became more systematised, and in 1718 it was found necessary to deliver them over to a contractor who engaged to take them to His Majesty's colonies and plantations in America on condition of his having property and interest in their services for a specified term of years. They were given over to slavery in fact, and the contractor at the termination of the voyage put them up to auction and sold their services to the highest bidder. In 1776 it became no longer possible to send these outcasts to America. Some of the colonies had for years past continually protested against the system; but the war of independence left no alternative but to put an end to it, and the government had to find some other mode of disposing of these criminals, estimated in 1778 at 1000 annually. This difficulty originated the practice of confining prisoners in hulks in the Thames or in the harbours of Portsmouth, Chatham, &c.

This was intended only as a temporary expedient pending the execution of an act devised by Blackstone, Eden (Lord Auckland), and Howard, for the building of penitentiaries in England, which were intended to provide a separate cell for each of the inmates, who were during their imprisonment to be employed on useful labour. Chap. 74 of the 19th Geo. III., after reciting that 'the punishment of felons and other offenders by transportation to His Majesty's Colonies and Plantations in America is attended with many difficulties, and enacting that such offenders might be transported elsewhere, and that offenders who might be sentenced to be hanged in the hand might instead be fined or whipped, proceeds to say that 'whereas, if many offenders convicted of crimes for which Transportation hath usually been inflicted were ordered to solitary imprisonment accompanied by well regulated labour and religious instruction, it might be the means under Providence not only of debarring others from the commission of the like crimes, but also of reforming the individuals and inviting them to habits of industry, it shall be lawful to appoint supervisors who shall erect penitentiaries where such persons may be ordered to imprisonment and hard labour.' The first hulks were established in 1778; and this fatal temporary expedient serves to illustrate the sarcasm as to the superior permanency of temporary expedients, for the last hulk was not closed until a fire destroyed it in 1867; and in fact they had a perfect representative in Gibraltar prison, which was constructed on the model of a hulk and developed all the evils of these establishments, and which was only closed in 1875 after strenuous

opposition to its abolition by the local naval and military authorities. Many years were destined to pass before the permanent penitentiary system became a fact. Great efforts were made to revive the transportation system, and in 1787 a new penal colony was founded in Australia. This with the hulks continued to form the punishment next in gravity to capital execution until the last hulk was closed in 1857 and the last batch of convicts was sent to Western Australia in 1867. It is not necessary to describe the hulk system, if system that can be called in which the inmates were herded together in unchecked association, where 'vice, profaneness, and demoralisation' flourished. The prisoners in the hulks were described by a committee of the House of Commons in 1832 as 'well fed, well clothed, indulging in riotous enjoyment by night, with moderate labour by day, so that life in them is considered "a pretty jolly life."' But no attempt was then made to abolish them.

The hulks were at first, like all other prisons, placed under the management of the local justices, who appointed the overseer, and the overseer appointed the officers; the justices also made the overseer contractor for the maintenance of the prisoners, and as it was obviously his interest as contractor to cut short the supplies of food and clothing for the prisoners, they therefore by this measure contrived that his interest should be diametrically opposed to his duty and to the welfare of the prisoners in his charge. The supervision of the hulks resided in the Court of King's Bench, who steadily neglected their duty, and the inspector provided for by parliament was not appointed. In course of time and by degrees the Home Secretary usurped power over these establishments, and his action was endorsed by parliament in 1815; and their connection with the King's Bench was severed in 1825. An inspector was appointed, after that a superintendent; and after some other changes the control and administration of the hulks was in 1850 vested in the Board of Directors of Convict Prisons.

Transportation to Australia, which began in 1787, for many years provided for only a small part of the persons sentenced to transportation or respited from execution. Until 1816 an average of only 474 prisoners was transported annually to Australia, after that the average rose to 3000, and in 1834 amounted to 4920. Transportation in its most flourishing days was characterised by evils which rivalled if they did not sometimes surpass those of the hulks.

Whilst, however, it was in full vigour a step was taken, feebly and slowly indeed, towards the creation of the penitentiaries intended in 1776 to form a permanent substitute for transportation to America. Millbank Prison (q.v.) provided means for the confinement of every prisoner in absolute separation, according to the modern doctrine, and it was intended that his treatment should be on the most advanced reformatory system; but this experiment went no further at this time. In 1838 the existence of the terrible evils which attended the transportation system were formally established by the report of a commission, who said that the system was unequal, without terrors to the criminal class, corrupting to both convict and colonist, and very expensive, and they recommended punishment in penitentiaries instead.

Various improvements in the Millbank system were introduced after this, and finally in 1842 it took the form of passing the convicts through two stages of discipline in certain prisons at home before sending them to complete their sentences in one of the colonies. The first of these stages was passed in a prison in which each inmate was kept

in complete separation; the second in a prison in which he was employed in useful public works in regulated association, but confined in a cell by himself by night and at all times when not at work or in chapel. The complete efficiency of this stage was at first marred by a certain number of convicts being placed in association at night, but in time the separation came to be thoroughly carried out, the only exception being in the cases of prisoners who on medical grounds could not properly be left alone. The first stage was regulated according to the system adopted, first experimentally, at the model prison at Pontonville which had been erected in 1842. When the experiment had been proved to be successful, convicts were sent to undergo it at Millbank Prison and at other prisons of which the construction was suitable. The second or public works stage was carried out in prisons like Portland, which was constructed for the purpose in 1847. Dartmoor Convict Prison was opened in 1850 for the same purpose, Portsmouth Prison in 1852, Chatham in 1856, &c. In these the convicts were employed in large public works, in farming, in land reclamation, in quarrying, &c. The breakwater at Portland, the fortifications of that island, the large extension of the dockyards at Chatham and Portsmouth, the forts which protect Chatham, and various other military and naval works, besides the construction of large prison establishments, attest the advantages of the system, which also enabled the prisoners to gain a useful knowledge of trades by which they could obtain employment on their release.

From 1844, and more rapidly after 1852, the number of prisoners actually transported gradually diminished, most of those who received that sentence being discharged on free pardon in England after serving from half to two-thirds of their sentences. In the course of time the opposition of the Australian colonies to the continuance of transportation led to the abandonment of the system altogether, and since 1867 no convicts have been sent thither. The punishment of penal servitude was by various acts passed between 1853 and 1864 substituted for transportation. These acts introduced certain notable modifications in regard to sentences of the next degree of gravity to capital punishment. When transportation was in force a prisoner on whom such a sentence was passed might be treated in any of three different ways. Commencing his sentence in the local prison, where he remained until it was thought proper to remove him, he might be transferred either (1) to Australia, from which in all probability he never returned, whatever the length of his sentence; (2) to Gibraltar or Bermuda, from which he was brought back to England when he had served a certain portion of his sentence, and there discharged; or (3) to the hulks, or to the 'public works' prisons substituted for them. If he went to Australia he was in the early days assigned as a servant to some free settler, and so at once ceased to be actually a prisoner; but in later years a system was established under which all prisoners first passed a certain time in a convict establishment and then were discharged conditionally to find employers for themselves. It also became the practice ultimately to retain all prisoners sentenced to transportation for a certain time in a prison in England, conducted on the separate system, from which they might be sent either to the hulks or to the 'public works' convict prisons which replaced them, or to one of the convict establishments abroad. If sent to the hulks or 'public works' prisons they might either remain there till discharged, or be drafted off to one of the convict establishments in the colonies. Whichever of these modes of disposing of the

convicts was followed, in none of them did they pass the whole of their sentences in the condition of prisoners, a most important consideration to bear in mind. Those who were sent to Gibraltar or Bermuda, as well as those who did not leave the country at all, but were confined in the hulks, were released on free pardon after they had passed about half their sentences or a little more. Those who went to Australia were released even sooner, but in their case only on certain conditions, by which a hold over them was maintained.

When the objections of the Australian colonies to the continuance of transportation thither made it necessary to adopt some other plan for disposing of these prisoners, the Penal Servitude Act, 1853, was passed in order to carry out a system founded on that which had been followed with regard to prisoners sentenced to transportation, but providing for the large majority being retained at home. Under this act a sentence of transportation could not be passed for less than fourteen years, and a sentence of penal servitude was substituted for all lower terms. But the sentences of penal servitude permitted by this act were shorter than the sentences of transportation assigned to various crimes under the old acts, because it was intended that the whole of the sentences of penal servitude should be passed in confinement; the terms were therefore fixed so as to correspond with the periods which had actually been passed in prison by convicts who had been sentenced to transportation but not actually sent out of the country. For seven years' transportation or less was substituted four years' penal servitude; for over seven but not over ten years' transportation was substituted not under four years and not over six years; for over ten but not over fifteen years' transportation was substituted not under six years and not over eight years; for over fifteen years' transportation was substituted not under six years and not over ten years. No difference was made in life sentences. Power was taken in this act to release convicts in the United Kingdom conditionally or on ticket-of-leave, instead of releasing them as formerly on free pardon. It was not intended that this power should be exercised in the case of sentences of penal servitude, as they had already been shortened to the terms actually served in prison under the sentence of transportation, but only in the case of prisoners sentenced to transportation who were not actually sent out of the country. The convict prisons therefore contained inmates serving under different conditions: those under sentence of transportation might have a remission of part of their sentences if well conducted, those under sentences of penal servitude could get none.

Before long it was found that great disadvantage in training and reforming the convicts, and in managing them by appealing to better feelings than those of mere fear, arose from the absence in the case of prisoners sentenced to penal servitude of the hope of gaining a remission of sentence; and the comparison in this respect between these prisoners and others in the prisons who were under sentence of transportation gave rise to great discontent among the prisoners. The consequence was that in 1857 another act was passed which made the length of sentences of penal servitude the same as former sentences of transportation, and thus facilitated the application of the system of remission to sentences of less than fourteen years as well as to those above that term. The House of Commons Committee (1856), on whose report this course was adopted, also recommended the introduction of a shorter term of penal servitude intermediate between the highest term of imprisonment then in ordinary use and the lowest term of transportation or, as it had become, penal servitude.

Accordingly the Act of 1857 authorised a sentence of not less than three years' penal servitude for any offence which might be punished by seven years' transportation. In carrying out this act prisoners were allowed to gain remission of a portion of these short sentences as well as all the others.

About this time very warm discussions were being carried on on the subject of penal systems, originating partly no doubt in the great change necessitated by the gradual abolition of transportation; and about 1861-62-63 those who attacked the system which had actually been introduced were able to point to a recent increase of crime as a justification of their attacks on it, more particularly on the ticket-of-leave system. (Great point was given to this feeling, and it was much intensified, by an outbreak of crimes of violence in the metropolis (garroting). The result was that a Royal Commission was appointed to report on the Penal Servitude Acts and the system adopted to carry them out. In consequence of the report of this commission in 1864 another Penal Servitude Act was passed, in which the government did not fully adopt the recommendations of the Royal Commission, but they raised the minimum term of penal servitude from three years to five years, except in the case of those who incurred a second sentence of penal servitude, in whose cases seven years was the minimum term permitted. This latter provision was repealed by the Prevention of Crimes Act, 1879. A review by the light of later experience of the grounds on which the recommendation of the Royal Commission was made cannot but lead to the opinion that erroneous deductions were made from imperfect data.

The Directors of Convict Prisons in their annual reports had more than once referred to the anomaly peculiar to the United Kingdom by which no sentence was possible between two years— which was practically the limit of a sentence of imprisonment—and five years, which was the shortest legal sentence of penal servitude, and had expressed their opinion that it was desirable to reintroduce the power of sentencing to penal servitude for terms as low as three years, which existed from 1857 until the Act of 1864, and was abolished by that act in consequence, as has been seen, of the report of a Royal Commission. In 1891 an act was passed to allow of the sentence of three years being imposed in future. By the Act of 1857 power was given to the Secretary of State to release convicts conditionally before the expiration of their sentences. This system, known as the ticket-of-leave system, was at the time strenuously attacked, under the erroneous supposition that it first introduced a system of releasing prisoners before they had served their full sentences; but this, as has been already stated, they never actually had done. On the contrary, under the ticket-of-leave system they were in point of fact detained to serve in prison a larger part of their sentences than had been customary before. Moreover, under the new system, instead of being absolutely pardoned when released, they were subject to revocation of their licences if they did not conduct themselves well, by which their abstention from crime was materially guaranteed.

The Prison Act of 1898 was an important measure in that, among other things, it served to place convict prisons and local prisons (see below) under one board of commissioners, and gave power also to the Secretary of State to make rules for the government of both types of prison, subject to parliamentary approval, so that henceforth the whole prison code had parliamentary sanction, and could be altered at any time by parliamentary rule without the necessity for fresh legislation. In 1899, as an outcome of the act, there was drawn up a complete new code of rules which has since been but slightly

amended, and which, if allowance be made for the establishment of the Borstal and preventive detention systems (see below), remains the basis of all prison treatment to-day. The rules of the Secretary of State are interpreted and expanded by a body of standing orders, unpublished except for the use of the prison service, and in this way secrecy obtains as to the final details of prison régime.

The principle on which, in the first days of convict prisons, the system of punishment was founded was that those who were subject to it should suffer discipline of such degree of severity as might act as a deterrent to them and to others who might be tempted to become criminals, but that they should at the same time be brought under the reformatory influences of religious teaching, good example, and such training in self-control as could be given by offering certain advantages to industry and good conduct, as well as inflicting suitable punishment for the reverse. That principle may be said still to be the basis of the system. In order to guard against that contamination which was such an evil in older forms of confinement, in the new convict system prisoners were divided into two classes, and this idea was later more fully developed, convicts to-day being very carefully classified by the Directors of Convict Prisons according to their previous history and character. Questions are sent to the police, old employers, and persons who knew the convict in his youth, and on the replies, the man is relegated to the Star, the Intermediate, or the Recidivist Class. To the Star Class are sent men of previous good character; to the Intermediate, those who either from their youth or their character may be said not to have formed habits of crime; to the Recidivist, those guilty of grave and persistent crime.

In the two stages of the original penitentiary system important changes have been made. Thus the tendency has been to shorten the period of separate confinement, and in 1910 it was reduced to one month for the Star and Intermediate Classes, and three months for the Recidivist Class. Again the opportunity for that employment in public works which was typical, in the early days, of the second stage of labour in regulated association has largely disappeared, and under present conditions a very large proportion of convicts are engaged, not in heavy open-air labour, but in workshops, as carpenters, tailors, moulders, smiths and fitters, printers, shoemakers, and as makers of baskets, mail bags, twine, and rope. The rewards to industry and good conduct are granted under what is known as the progressive-stage system, and now the convict may earn a remission of one-fourth of his sentence, besides gaining certain privileges in regard to letter-writing, visits from his friends, and such like indulgences. The practice which existed until 1864 of encouraging industry and good conduct by certain increases in the diet was discontinued from that date, on the principle that rewards to prisoners should not be destructive of the necessary penal or restrictive conditions of prison life.

At the head of every convict prison is the governor, whose duty it is to administer and supervise all branches of the prison. He is assisted by a staff who have to control and regulate the discipline and employment of the prisoners, and a staff of clerks, who keep a record of all matters relating to the prisoners and their sentences, their conduct, &c.; and also by a storekeeper, with a staff of clerks, who has the charge of stores and accounts. The chaplain conducts divine service, visits and advises the prisoners. He has under him schoolmasters, who conduct their education. The medical officer has charge of matters relating to the health of the prisoners. The

hospital is constructed on the most modern principles, and provides accommodation for some patients in separation and for the association of those for whom the medical officer thinks it necessary. To control and supervise these convict prisons a body called the Directors of Convict Prisons was created for England and Wales by statute in 1850, whose powers unite those of visiting justices of ordinary prisons with those of various bodies which had been created by parliament from time to time to govern the various convict prisons placed under their management. A similar body was created for Ireland in 1854, and there a system founded on and closely resembling that which had been developed in England was created; but until 1888 (when a convict prison was established at Peterhead in connection with the convict labour at the harbour-works) all male convicts sentenced in Scotland served the greater part of their sentences in convict prisons in England. The convict prisons are visited frequently by one or more of the directors, whose duty is to see that the governor and the other officers of the prison are doing their duty, and to hear and determine any reports against the prison officers. To directors also the prisoners can complain or appeal if they consider they are not fairly treated, or bring forward any requests they have to make, but which the governor has no power to comply with. A Board of Visitors appointed by the Secretary of State visits the prison monthly to hear and determine serious reports against convicts, and to hear any complaints they may have to make.

Each day marks are awarded to every prisoner according to his industry, and these marks measure daily his progress towards attaining that remission of a quarter of his sentence which he is allowed to earn, as well as towards his promotion to a higher class, in which he may enjoy certain privileges before referred to. The punishments inflicted on those prisoners who misconduct themselves consist of close confinement, reduction of diet, forfeiture of the privileges already earned, and forfeiture of remission. Flogging with a 'cat' or a birch can only be awarded in the gravest cases, such as assaults on warders, &c., after being reported to the Board of Visitors and determined by them, and subject to confirmation by the Secretary of State.

As regards the health of the prisoners in convict prisons, statistics show that their favourable position in respect of sanitary requirements, the regularity of their lives, and the constant medical care taken of them result in a low mortality; and this result is brought about in spite of a large proportion of the inmates of prisons being persons of low type, who have led dissipated and irregular lives. The conduct of the prisoners is, as a rule, very good, the result of a steady system of control under which exact discipline is enforced, and, while good conduct and industry are encouraged, misconduct is surely punished. The great bulk of prison offences are committed by a few habitual offenders against the rules.

The prisons in which sentences of imprisonment are carried out have a separate history from that of those which have been described. There were so far back as two centuries ago occasional protests against the abuses and cruelties practised in prisons, and a notable parliamentary inquiry into the misconduct of a gaoler named Benbridge was held in 1730; but until the last quarter of the 19th century the idea that prisoners had any claim for humane treatment had hardly made any way beyond the circle of a few philanthropic reformers; any attempt to use the period of imprisonment to improve the nature of the criminal was almost unknown. The way to better things was undoubtedly opened by Howard's visits of

prison inspection about 1776, and in following years, and by his reports on the condition of the prisons he visited, followed as they were by proposals for reform and improvements which were enjoined and encouraged by acts of parliament. Solitary confinement with labour and instruction was approved by statute in 1774, and in 1784 general regulations were formed for the treatment of prisoners, among which a proper classification of prisoners according to the gravity of their offences was enjoined. In 1791 justices were enjoined to visit and inspect these prisons three times in each quarter, and to report on them to quarter sessions.

In 1814 the appointment of chaplains was made compulsory. But compliance with these statutory reforms did not immediately follow, for indeed it was a long time before they passed into the stage of practical fact. In 1818 there still remained 518 prisons in the United Kingdom, to which more than 100,000 prisoners were committed in the year, and only twenty-three of these had been subdivided so as to enable the above classification to be carried out. In fifty-nine of them the males were not divided from the females (and in fact there was no statutory injunction to this effect until 5 Geo. IV. chaps. 65 and 85). In 445 prisons there was no employment of any kind for the prisoners; in 100 of the gaols overcrowding was excessive; no less than 13,057 prisoners were crowded into the space which, according even to the moderate demands of those days, was fit for only 8545. The prisons were in many cases so ill-regulated that they became scenes of abandoned wickedness. In 1835 and 1839 most important legislative steps were taken. Further rules of administration were laid down in the acts passed in these years, and inspectors of prisons were appointed to see that they were carried out. By the latter act also the vital importance of a suitable design and construction for gaols as an aid to good prison management was recognised by the creation of the office of Surveyor-general of Prisons to advise in these matters.

Howard had advocated the complete separation of prisoners by placing each of them in a cell alone, and this was provided for in the Penitentiary Act, 1778. The practice was adopted in a few county prisons, and it was again enjoined together with daily divine service and the absolute separation of males from females in 5 Geo. IV. chaps. 65 and 85, but the expense of building these cells fortified a prejudice against the 'solitary' system, which was largely increased by the too thorough mode in which it had been carried out in America. A commission which was sent in 1834 to America to inquire into the matter, however, reported entirely in favour of the principle of separation if judiciously carried out. Their recommendation was followed in the construction of Pentonville Model Prison in 1842, and the success of the system led to an extensive reconstruction of county prisons on the same plan, finally resulting in that system being adopted to the exclusion of any other.

Although some progress in other respects followed the Acts of 1835 and 1839, there was still so much imperfection and such want of uniformity in rules, diet, labour, &c. that further reforms and stronger pressure on the local authorities in whom the management of the prisons was vested was urgently called for. These were provided by the Prison Act, 1865, which enacted a code of rules for all prisons, and required that each male prisoner should be provided with a separate cell.

In 1878 a further and most important step was taken by the transfer of the control and pecuniary charge of all the local prisons to the government, represented in each member of the United Kingdom by a body of commissioners appointed by royal warrant. This measure was justified by the im-

possibility of ensuring due uniformity in the treatment of prisoners in all gaols so long as they remained in the hands of so many independent local authorities, by the great difficulties, amounting to impossibility, in getting some of the local authorities to provide proper prison buildings, and by the unnecessary costliness which resulted from the existence of so many small and independent prisons. In ways which have been shown above the Prison Act of 1898 applied equally to local and to convict prisons, and of necessity the powers given by the act to the Secretary of State, and turned to account in the code of 1899, further ensured uniformity of control.

Prisoners before trial form a separate class in the prisons, and are now subjected to no more inconvenience than is necessary to ensure security and due order and discipline in the prison. They may wear their own clothes and supply their own diet if they choose, have full opportunities of receiving visits from their friends and corresponding with them, and are not obliged to perform any unaccustomed or menial labour for themselves if they will pay for assistance.

It was, however, evident that a man who was unable to find bail was at a disadvantage as compared with one who was at liberty until his trial. He was kept in enforced idleness, and could not be allowed to associate with convicted prisoners. He was, moreover, unable to earn the small amount of money required for the purposes of his defence. This has been corrected, however, by allowing prisoners to work at their trades or at the manufacturing work of the prison and to receive their earnings, less a small reduction for their maintenance and the use of tools. The money thus earned can be sent to the prisoner's relations, expended on his defence, or given to him when he leaves the prison either on acquittal or after serving his sentence.

The evils of enforced idleness were self evident in the case of debtors. Up to the year 1898 they were kept apart from other prisoners and were allowed to lounge about in association, providing their own clothing, bedding, and food, which might include an allowance of wine or beer. This was not so objectionable at a time when persons could be imprisoned for debt, but when the law was altered in 1869 to limit imprisonment to those debtors only who refused to pay when they had the means, debtors were virtually a class guilty of fraud. In 1898 this was recognised by compelling debtors to work, and allowing them to earn money by their industry at the rate of not exceeding 2s. 6d. a week.

To pass from these special classes to the ordinary prisoners, the general rule is that after sentence every prisoner is permitted to raise himself progressively by industry, combined with good conduct, through four stages, in each of which he gains some amelioration of his treatment. If he is sentenced to imprisonment with hard labour, the first month is spent in hard bodily or manual labour for not more than ten hours in strict separation, and for the first fourteen days he sleeps on a plank bed without a mattress. Female prisoners are exempted from these deterrent features. A prisoner sentenced to imprisonment without hard labour is associated at labour from the beginning of his sentence. He may be subjected to punishment by deprivation of diet, confinement in a cell, and in case of violence corporal punishment (limited by the act of 1898 to mutiny and gross personal violence to officers) with a birch or a cat-of-nine-tails. The necessity for these punishments has, however, very largely diminished—a result of the system of progressive stages: for if he is ill-conducted or idle his progress into the higher stages.

is delayed, or he may be degraded into a lower stage after attaining to a higher. Certain powers for the infliction of punishment reside with the governor, but corporal punishment or heavier sentences than he is empowered to award can only be inflicted by order of the magistrates who form the visiting committee of each prison, and subject to the approval of the Secretary of State.

The visiting committee are appointed every year by quarter-sessions, about twelve to each prison. Their duty is to visit the prison periodically, to hear any complaints of the prisoners, to deal with reports made of the misconduct of any prisoners, and to fulfil certain other functions more particularly laid down in the rules made by the Secretary of State: but they have no authority over the officers. In fact, whereas up till 1878 the local authorities managed the prison, and the government inspected it, the position is now reversed—the government manages and the local justices inspect. The Prison Act of 1898 provided for the classification of prisoners by the court into three divisions, according to the nature of the offence and the antecedents of the offender. A cardinal principle is that every prisoner under sentence should be fully employed. Hard labour consists of stone-breaking, oakum-picking, and the like. Labour other than hard is varied in character, and the list of trades followed or articles made in the prisons enumerated in the annual reports reaches to about 150. A large proportion of the prisoners supply the wants of the prison population by weaving, tailoring, &c., but, as may be imagined, there is a large number of prisoners who know of no industry which can be followed in prison, and great difficulty is found in providing them with work, for they do not generally stop long enough to learn a trade to any good purpose. Mat-making was from early times one of the principal prison industries, but later had to be almost abandoned in consequence of an agitation begun about 1872 by outside workers in charitable institutions—here, as in prisons, its ease of acquisition was its specially desirable feature—and elsewhere, who complained of the unfair competition of prison labour. A great deal of manufacturing work is now carried out for public departments, such as mailing and string for the Post Office, seamen's bags, coal sacks and ships' fenders for the Admiralty, hags and mattresses for the War Office.

Every prison has its medical officer, and a well-regulated and well-constructed infirmary. The death-rate from natural causes in prisons in England and Wales is generally less than 50 per 1000 prisoners received. The absence of all diseases due to insanitary conditions is the main reason of the healthy condition of the prisoners; and no doubt the strict temperance—for no alcoholic liquors form part of the dietary—and the regular life contribute to this result.

In order that the standard of efficiency may be maintained in all the prisons, and that opportunities may be given to both officers and prisoners to communicate any complaints they may have to make, inspectors are appointed to visit each prison, and to report to the commissioners on any point which may require their intervention.

The design and construction of a prison is, as may be supposed, a feature of the very first importance. Security is of course one of the essentials, but there are others almost as important. In looking over old prisons, as that built at York under the inspiration of Sydney Smith, one cannot but be struck with the massiveness of construction of many of them—the huge bars and bolts, the large clumsy locks, the ponderous grated doors, and sometimes chained to the wall the heavy fetters with which the prisoners were loaded. By such means as this it was intended to ensure the safe custody of the

prisoners without constant personal watchfulness and supervision by the prison staff. All this is changed in the prisons of more recent date, but the security is even greater than before, because in a prison of modern construction the supervision can be more thorough. In a prison of modern construction the site is surrounded by a wall about 18 feet high, outside of which, unless a road or street runs along the boundary, a margin of about 20 feet is left unbuild on as a precaution against the facilities which buildings against a wall may give for scaling or breaking through it.

The prison is entered through two pairs of double gates, having a space between them sufficient for a wagon to stand in, so that the solid outer gate may be shut before the grated inner gate formed of iron bars is opened. At the side of the gate is the porter's lodge, and perhaps certain waiting accommodation and rooms in which the prisoners may, under supervision, receive visits from their friends. These gates give admission to the outer court of the prison. Opposite the gate is probably the entrance of the main building; the offices of the governor, chaplain, &c. are placed here. After passing these the buildings occupied by prisoners are arrived at.

Every prisoner occupies a cell measuring 13 feet by 7 feet, and containing 800 cubic feet of air, with a grated window, part of which is made to open; in the wall are inlets from a channel for fresh air, warmed when necessary by hot water pipes, and outlets for foul air drawn out through flues which communicate with a furnace and tall chimney in the roof. On shelves in the wall are the books and the small utensils provided for the prisoner's use. The furniture consists of a stool to sit on, a fixed table, a wooden bed board and a coir pillow, sheets, blankets, and rugs, and a mattress for the prisoners who have passed the first stage. A bell-pull, by means of which a warder's attention can be called when necessary, and an eye-hole in the door through which the warder can inspect the prisoner, are provided in each cell.

Rows of cells such as this are arranged alongside each other, and on opposite sides of a corridor about 16 feet wide, which is open to the roof; and there may be above the ground-floor two or three tiers of cells, access to which is given by iron stairs and a gallery off which the cells open. There are possibly some cells on a lower level, where usually the heating apparatus and sometimes the cook-house, bakehouse, workshops, and stores are situated; but in the most recent constructions it is thought better to place these latter in separate buildings outside the block of cells. A hospital for sick patients is provided, and a separate block of cells in which prisoners are placed on first reception, and where they are cleansed and examined by the doctor, and their private property and clothes taken from them, the latter being replaced by a prison suit if the prisoner is convicted, or if before conviction he prefers not to wear his own clothes. The department for females is put distant from that for males, and no male officer is allowed into the female division unless he is accompanied by a female warder or matron. The chapel is a prominent feature in the prison, for prayers are read before all the prisoners who can attend every morning, and on Sunday there are morning and evening services. In prisons built on this model towards the middle of the 19th century the chapel was divided into little boxes, so as to isolate prisoners completely from each other. This construction has for some time been abandoned as having failed in its object, and as being destructive of the value of the service.

In connection with the offices is a library of selected books for issue to the prisoners, which is

under the control of the chaplain. In some part of the cell block is a bath-house, where prisoners are required to wash themselves periodically; and in connection with the female side of the prison is a laundry for the washing of the prisoners' clothing, sheets, &c., and in which also sometimes washing is done for people outside on payment. There are also workshops in which carpenters, smiths, &c., can carry on their trades for the benefit of the prison. Large airy yards surround the blocks in which the prisoners live. In these they take their daily exercise under supervision of warders, and separated by such an interval from each other as may prevent oral communication—indeed, at all times and in all prisons, both convict and local, a virtual law of silence is enforced, all intercourse or communication between prisoners being forbidden except, with slight relaxations after a certain period of sentence as a reward for good conduct, where necessary for the conduct of the prison or in connection with the labour of the prisoners, the claims of discipline and the prevention of corruption being held to render the restriction necessary. Part of the space inside the walls is often cultivated for vegetables for consumption by the prisoners.

Since 1869 a new feature has been developed in controlling the criminal class. By an act passed in that year and revised in 1871, the latter being called the Prevention of Crimes Act, any person convicted on indictment a second time may be subjected to 'supervision' by the police for seven years after the expiration of his sentence. During this period he is required to report himself to the police once a month, and to keep them informed of his residence; he is also required to prove his innocence if certain suspicious circumstances are brought against him. If he fails to comply with the obligation to report himself he may be imprisoned for a year with hard labour. The convict released conditionally before the termination of his sentence is subject to similar obligations, and if there are reasonable grounds for believing that he is leading a criminal life, or showing himself unworthy of the freedom conditionally granted him, or if he should be actually convicted of crime, he may be returned to prison to undergo the whole of that part of his sentence which was remitted. Persons who are found by the court to be habitual criminals may, in addition to a sentence of penal servitude, be awarded a term of preventive detention for not exceeding ten years and are detained in a special convict prison, or part of a prison, under rules that are intended to foster industry, thrift, and self-respect, and which mitigate the necessary severity of penal discipline in convict prisons. The duration of the term of preventive detention may be shortened if the prison committee reports that a convict may be liberated without danger to society. Following liberation supervision takes place, but not of the kind in practice under the ordinary ticket-of-leave system. Licence is positive rather than negative in character; and the supervision is not of the police authorities but of the Central Association for the Aid of Discharged Convicts, a voluntary association subsidised by government. This association compels a person to proceed to an approved place where work has been found, not to move from that place without permission, to be punctual and regular in attendance at work, and to lead a sober and industrious life. The extension to other than habitual criminals of the principle of a positive in place of a negative licence has gained increasing advocacy, as has also an extended application in the treatment of crime of the whole idea of preventive detention; any such extended application would almost necessarily involve the adoption in some form or other of the indeterminate sentence.

To aid in the work of detecting criminals a Habitual Criminal Register has been established, in which the names, descriptions, photographs, and criminal career of all persons who are proved to have been twice convicted on indictment are recorded. This register is printed and circulated to all police forces and prisons, and supplies means of establishing the identification of any prisoner who comes into their custody, who is suspected to be an habitual criminal; it also indicates what prison should be applied to for further evidence. To show, in cases where no special identity is suggested, whether any person in custody is on the register of habitual criminals, a Distinctive Marks Register has been established, in which all the peculiar marks of those who have been registered are classified and recorded.

The Inebriates Act of 1898 provides that special provision should be made for 'criminal' inebriates, persons who committed their crimes in consequence of drunken habits. Accommodation for females is provided at Aylesbury and for males at Warwick.

In 1901 a special treatment was established both in local and in convict prisons for mentally defective prisoners, and under the Mental Deficiency Act of 1913 provision is made for the supervision of criminal defectives in state and certain certified institutions. Defectives may be sent to these institutions either from prison or direct from the courts. The act of 1913 is limited in scope and is important less in its results than in its being a pioneer piece of legislation in the direction of removing from prison surroundings those who, through mental affliction, drift into criminal courses. To the view that mental disability may largely contribute to the commission of crime, increasing recognition is accorded, as is practically to be seen in the 'Birmingham experiment' of 1919 and after, and extensions of that experiment, under which no person in whose case there is any suspected mental element is sentenced to imprisonment until after full investigation of his mental state.

The taint resulting from imprisonment is a circumstance which, it must be supposed, cannot in the nature of things be removed. At the same time, in the Criminal Justice Administration Act of 1914, recognition is given to the principle that it should not be needlessly increased. Thus where desired, and unless there be good reason to the contrary, courts are obliged to allow time (not less than seven clear days) for the payment of fines, the old practice of almost automatic commitment for trivial offences in default of payment of fines being in this way removed; in all cases also where the offender is not less than 16 nor more than 21 years of age, the court may allow him to be placed under supervision until the fine is paid, recognition here being given to the Borstal principle (see below). The act also, as a provision against the admitted evil of short sentences, enacted that no imprisonment should be for a period of less than five days, detention for lesser periods in certified police cells, &c. being, however, allowed. Among other things the act also regulated the imposition of hard labour along with imprisonment, and aimed at the more effective classification of prisoners into divisions.

The separate treatment of young persons of both sexes under what is known as the 'Borstal System,' which had been in force for several years at selected prisons in England, was embodied in the criminal law of the country on the 1st of August 1909, under the Prevention of Crime Act, 1908 (Part I), which empowers the court to pass a sentence of detention under penal discipline in a Borstal institution for a term of not less than one year (now two years), and not more than three years, and the persons liable to such detention are those between the

ages of 16 and 21, whom, by reason of criminal habit or tendency, it is expedient to detain for lengthened periods under such instruction and discipline as appear most conducive to reformation and repression of crime. The act is the formal embodiment in the penal law of England of all those conclusions which experience of the working of the 'Borstal System' during a number of years had suggested, and has for its object the conversion into honest and law-abiding citizens of young criminals who in many cases, from want of opportunity and knowledge of better things, come into conflict with the law during that period of life when their manhood is not fully developed, and their unformed habits of body and mind admit of the application of reformatory treatment with a good prospect of ultimate success. The act provides that after the expiration of six months, if there is a reasonable probability that the offender will abstain from crime and lead a useful and industrious life, he may be released on licence from the institution on condition that he is placed under the supervision or authority of any society or person willing to take charge of the case; and with this object an association, called the 'Borstal Association,' partly supported by public funds, has undertaken to take charge of the lads on their discharge. By the Criminal Justice Administration Act of 1914 the Borstal principle received an important extension; by this act also the minimum period of detention was raised from one to two years, and the period of supervision beyond the expiration of the original sentence, from six months to one year. The training in the Borstal institutions consists mainly in trade instruction, physical drill, and hard work, with a fair proportion of exercise, games, &c.

The penal law in its bearings on the imprisonment of young persons under 16 years of age was virtually revolutionised by the Children Act of 1908. Under this act penal servitude or imprisonment for persons under 16 years of age is practically forbidden, except in very exceptional circumstances where an alternative form of punishment is considered by the court undesirable. Confinement when it takes place is for a period not exceeding one month, and is not in ordinary prisons but in 'places of detention' specially created by the act. Under the probation system, which may be considered of special service in the case of young persons, but is not confined in its application to them, an offender, in place of being sentenced to imprisonment or other punishment, may be discharged, perhaps under supervision, provided he undertake to be of good behaviour, and to appear for conviction and sentence when called on at any time during some specified period not exceeding three years. The whole system was improved and extended by the Probation Act of 1907, provision being made for the appointment of probation officers, and power being given to courts altogether to dismiss proved charges.

The first statutory recognition that it was expedient to make some provision for prisoners on discharge was in 32 Geo. III. chap. 45, by which justices might convey any such person by pass back to his parish; and, at the opening of the chapel of the New House of Correction for Middlesex, the chaplain, the Rev. Samuel Glasse, pointed out that, the discipline and training of the prison having it might be hoped supplanted the prisoners' habits of idleness and profligacy by habits of industry, the magistrates might be able to speak of them according to their merit or demerit to the parish officers. He observed, however, that this would not provide for the cases of Irish delinquents who had no settlement in the United Kingdom, but who were not few in number. He thus showed

the necessity for doing what in more recent times has been undertaken by societies for the aid of discharged prisoners. In 1823 the Gaol Act enabled a moderate sum of money to be paid for the benefit of discharged prisoners out of the rates, or from public benefactions belonging to the gaol, in order that they might resort to any place of employment or honest occupation. In 1862 societies for the aid of discharged prisoners received statutory recognition, and the money awarded by the justices for the assistance of any prisoner, to an amount not exceeding £2 per head, might be handed over to these societies for their benefit. This act was obviously a recognition of societies which already existed, but it afforded a great stimulus to the formation of others. The earliest of the existing societies was the Hampshire Society, which dates from 1802; Dalston Female Refuge dates from 1805; the Sheriffs' Fund, which deals with City cases, from 1807.

The transfer of all prisons to the government in 1878 had a most important effect in adding to the number of those societies. The Prisons Act had been passed partly to ensure uniformity of treatment of prisoners in all localities, and those who advocated the claims of the discharged prisoner were not slow to perceive that the same principle might be made to apply to the system of helping them to obtain honest employment on completion of their sentence; and, further, that the difficulty they had met with in inducing many of the local authorities to provide funds, or in raising private subscriptions, might be overcome, now that the government was responsible, because they were virtually bound to continue the grants which had been made by many local authorities, and could not refuse to make similar grants in places where the local authorities had hitherto failed to do so. In connection with this the Commissioners of Prisons took action with a view to securing the proper appropriation to this purpose of many charities and benefactions which were devoted in former times to the assistance of prisoners, but the exact objects of which were no longer applicable to existing circumstances. These funds were more or less within the cognisance of the Charity Commissioners, and some of the largest of them had already been diverted to objects quite disconnected from prisons or prisoners; but by means of an act passed in 1882 steps were taken by which most of these funds were appropriated for the benefit of discharged prisoners through the agency of various societies. Since 1887 every prison in England and Wales has had a discharged prisoners' aid society working in harmony with it.

The work carried on by these societies was found to be crippled by lack of funds, and in 1898 a scheme was approved for giving grants in aid at the rate of 6d. for every prisoner discharged, provided that the income derived from any charity should be deducted from the grant. The grant was conditional only on the efficient working of the society and upon a balance-sheet being published annually. The state did not claim in any way to interfere with the voluntary working of the societies. Besides societies working in connection with the local prisons in the provinces, there were five or six societies in London that undertook the care of convicts discharged into the Metropolis. It was inevitable that convicts should regard these societies as being in competition, and they were clever enough to try to set one against the other to their own advantage. In 1911, however, the after-care of convicts was systematised by the establishment of a Central Association subsidised from public funds to which all the existing aid societies were affiliated. At the same time the old system whereby a convict was paid a gratuity

on discharge was discontinued, the association undertaking to provide assistance in the case of every discharged convict. About one-fifth of the convicts discharged annually are, on the recommendation of the association, excused from reporting themselves to the police. By proposals approved in 1913 important changes were made in the after-care of prisoners discharged from local prisons. The former government grant of 6d. per head was raised to 1s., and here also all gratuities were abolished, the amount formerly so spent being handed over to the various discharged prisoners' aid societies throughout the country, to whom the disposition of all funds was entrusted, the general aim being that with the increased monies provided each aid society could give personal attention to every case irrespective of that length of sentence which formerly alone made possible the earning of gratuities. The work of the societies has now been extended to the wives and families of men undergoing imprisonment. The central organisation of aid societies was for long in the hands of a committee of the Reformatory and Refuge Union, a pioneer society in the work of aid-in-discharge and in its organisation, but since 1918 has been vested in the Central Discharged Prisoners' Aid Society, a body consisting of members of the several aid societies.

Under present ideas of prison administration notable improvements have been effected in prison régime. Prisoners sentenced to more than a month may, by industry and good conduct, obtain a remission of one-sixth of their term. Training-schools have been organised for warders, and all officers, both male and female, now undergo a course of four months' instruction in their duties. In the large female prisons there are crèches for infants, and the prison hospitals are staffed with trained nurses. Special cells are provided for prisoners suffering from tuberculosis. The female prisons are inspected by a lady inspector, and the prisoners are visited regularly by lady visitors. All prisoners of defective education who are under 40 are taught regularly in class. The prison libraries have been enlarged. The world's news is given to all prisoners by means of weekly addresses. Secular lectures have been organised, and missions are conducted in all prisons. The bulk of the prisoners are sentenced to too short a term to admit of technical training, but for those who have more than a month to serve there are now workshops and skilled trade instructors. The dangers of contamination are provided against by keeping first-offenders of previous good character in a class by themselves.

Improvements have also been made in convict prisons. The rules have been modified for convicts of feeble mind and for old men. Convicts who have served $7\frac{1}{2}$ years are admitted to a class to which are attached many coveted privileges. The monotony of a long imprisonment is broken by lectures and concerts at fixed intervals.

The prison population of Britain shows signs of steady decline. For England in 1876-77 the total average daily number of prisoners of all kinds was approximately 30,000; in 1920-21 it was 9800. For Scotland the corresponding figures are 2920 in 1876, 1870 in 1920, and 1890 in 1924.

Scotland.—Prisons and the prison system in Scotland of to-day are very similar to those of England, although the prisons in each country are administered by different government departments. English prisons being under the Home Office, whilst Scottish prisons are under the Scottish Office. The acts relating to Penal Servitude, Prevention of Crime—including Preventive Detention and Borstal System—apply to both England and Scotland. There are thirteen prisons in Scot-

land, legal places of detention for all descriptions of criminal and civil prisoners. Convicts can be detained in any prison. Male convicts, however, are confined in Peterhead prison, and are employed in making a harbour of refuge there. During recent years the system at the latter prison has been considerably modified, not with a view of making it more comfortable, but of making the system less severe and more humane. The men are allowed to take their meals in association, and to play games, such as football, with each other. Educational, gymnastic, and physical drill classes, concerts and debates conducted by the convicts themselves, are permitted under the supervision of prison officers. Convicts earn remission of sentence and are liberated on licence as in England; and persons undergoing sentences of more than a month's imprisonment earn remission of one-sixth of their term by industry and good conduct. For serious offences, such as mutiny, personal violence to a prison officer or to a fellow-prisoner, &c., a convict renders himself liable to corporal punishment by order of a Prison Commissioner, a power which is now vested in Boards of Visitors in England. All prisoners requiring help on discharge from prison are assisted by a Discharged Prisoners' Aid Society, one of which is connected with every prison. Convicts, i.e. those undergoing penal servitude, are taken care of by a Central Association, which is subsidised from public funds. In Scotland there is no First and Second Division for prisoners as in England.

United States.—In the early part of the 19th century the most advanced examples of prison discipline and construction were to be found in the United States, and improvements of great importance were initiated. Following closely on Howard's report, the 'Philadelphia Society for Assisting Distressed Prisoners' was founded in 1776—the first of the kind in the world; and, though dissolved during the War of Independence, it was reorganised in 1787, and is still at work. Large measures of reform were quickly secured. By 1790 the principle of separation was recognised, and in 1794 all convicts were separated and secluded. In the latter year, also, capital punishment was abolished in Pennsylvania for all crimes but murder in the first degree. It thus became necessary to devise some substitute for capital punishment. At the Eastern Penitentiary at Philadelphia, opened in 1829, the so-called 'Pennsylvania System' of permanent seclusion of convicts was carried out; the evil effects arising from the rigorous application of this principle have been already referred to, and in all other American prisons what is known as the 'Auburn System'—silent labour in association by day, and separation by night—came to be adopted. In the southern states survivals of the system whereby prisoners were leased out to the highest bidders for the term of their sentences are still to be found, and in certain parts of the country chain-gangs continue to be employed on road work. Ideas of criminal treatment along remedial and reparative lines early assumed importance in the United States. The first place of detention for juvenile delinquents was opened at New York in 1825; the first reformatories on the cottage or family system were established in Ohio—for boys at Lancaster in 1858, for girls at Delaware in 1878. In 1877 the Elmira (New York) Reformatory was opened, at which a now famous system has been adopted for the treatment of first-offenders under thirty years of age; the principal features are indeterminate sentences, the classification of prisoners into three classes under the marks system, and discharge upon probationary parole, under supervision. The prisoners enjoy a luxurious dietary, and many indulgences are granted to induce them

to work, so that the penal element of a sentence of imprisonment is entirely absent.

Later contributions of the United States to an improved prison system have shown themselves in the institution of convict road-camps and convict farms, where, outwith prison precincts, labour takes place under approximately free conditions; in the development of the 'honor system,' where at official discretion temporary liberty is granted to a prisoner on his honour; in a measure of recognition to the idea of corporate responsibility ('self-government'), under which prisoners as a body seek amelioration of the prison régime, undertaking in the common interest not to abuse any privileges granted; in the increasing application of scientific methods to the analysis of the mental elements in crime. In certain respects, however, some of which have been indicated, prison practice in the United States is behind that of countries of corresponding development.

Europe.—In Europe imprisonment as a general rule is cellular, sometimes severely so, though on occasion cellular confinement is combined with methods of associated labour. In France the method of transportation is still to some extent in use.

Prison Reform.—The problems of prison reform receive ever-growing attention. A prison congress held in London in 1872 led some years later to the institution of the International Prison Commission, a confederation of most of the civilised states of the world, having for its purpose the comparative study of the different methods, both of law and of administration, adopted in different countries for the treatment of crime and of criminal propensity. Conferences are held quinquennially in the countries of the various adhering states. Questions discussed, the discussions revealing the direction of prison reform, have been 'the individualisation of punishment,' the recognition of 'limited responsibility,' the institution of psychical laboratories in prisons, the indeterminate sentence, substitutes for, or alternatives to, imprisonment in the case of trivial offences, the classification and employment of prisoners, the supervision of persons under conditional conviction or liberation, preventive methods in the treatment of children and of all young persons. Reporting in 1921 on the English prison system, an unofficial inquiry, originally established in 1919 under the Labour Research Department, but subsequently disconnected from it, stressing the extent to which crime is due to poverty, to feeble mindedness, and to other causes not curable by punishment, favoured the substitution for the existing punitive system of methods based on principles of curative and educational treatment.

Privateer, a ship owned by a private individual, which, under government permission, expressed by a Letter of Marque (q.v.), makes war upon the shipping of a hostile power. To make war upon an enemy without this commission, or upon the shipping of a nation not specified in it, is piracy. Privateering was abolished by mutual agreement among European nations, except Spain, by the Declaration of Paris in 1856; but the United States of America refused to sign the treaty, for reasons which are given in the article Paris (q.v.). It is doubtful, however, how far that abolition would stand in a general war, for privateering is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially when the latter offers the temptation of a wealthy commerce. It was usual for the country on whose behalf the privateers carried on war to take security for their duty respecting the rights of neutrals and allies, and their observing generally the law of nations. While not considered Pirates (q.v.) by the law of nations, they were looked upon as little better during the great wars at the end of the 18th and the beginning of the 19th century, and as a rule received but scant mercy at the hands of the regular services. In the wars of 1793-1814 many English privateers were afloat. But in the same period no less than 10,871 English ships, with over £100,000,000, were taken by French 'corsairs'; the Breton privateer *Sarcot* took, in two months of 1807, prizes worth £291,250. At the American Revolution the new republic fully realised the advantage of its position in preying on the mercantile marine of Great Britain; and in the war of 1812 British commerce suffered severely at the hands of American privateers, of which it was computed that some 250 were afloat. During the American civil war the Confederate cruisers were at first regarded in the north as mere pirates; and the Alabama Claims originated in the charge against Britain of allowing the departure of privateers from British ports. In 1870 Prussia made a decree in favour of creating a 'volunteer navy.' There were no privateers in the Great War, 1914-18, but many mercantile vessels were fitted out and regularly commissioned for various services, such as cruisers for blockade duties, and also for anti-submarine work. The Germans used some to prey upon commerce, and destroyed about 400,000 tons of shipping on the principal trade routes; one of these vessels, the *Zee Adler*, was square-rigged, with auxiliary engine. See ENEMY, NEUTRALITY, ALABAMA, BUCCANIER, CORSAIR, PIRACY, PRIZE; Norman, *The Corsairs of France* (1887); Goner Williams, *The Liverpool Privateers* (1897).

Privet (*Ligustrum*), a genus of Oleaceæ, shrubs and small trees with opposite leaves which are simple and entire at the margin; the flowers small, white, and in terminal panicles; the calyx slightly 4-toothed; the corolla funnel-shaped and 4-cleft; the stamens two, projecting beyond the tube of the corolla; the berries 2-celled. Common Privet.

(*L. vulgare*) is a shrub growing in bushy places and about the borders of woods in the middle and south of Europe, and in some parts of Britain, now also naturalised in some parts of North America. It has half-evergreen, smooth, lanceolate leaves; and berries about the size of peas, black, rarely white, yellow, or green. The flowers have a strong and sweetish smell; the leaves are mildly astringent, and were formerly used in medicine. The berries, which hang on the shrub during winter, have a disagreeable taste, but serve as food for many kinds of birds; they have been used for dyeing red, and, with various additions, green, blue, and black. A rose-coloured pigment obtained from them has been used for colouring maps. The wood is hard. Privet, although not spiny, is much used for hedges, often mixed with some spiny shrub, or with beech. It bears clipping well, and grows well in the smoke of towns, also under the shade of trees. The other species of privet are natives of India and eastern Asia. Some of them are now to be seen in shrubberies in Britain. Most kinds grow readily from cuttings, but some of the more ornamental are grafted upon more vigorous species. The White Wax Insect (q.v.) of China deposits wax on *L. lucidum* and on *L. Itoha*.

Privilege. For the privileges of counsel, see **BARRISTER**; for the privileges of parliament, see **PARLIAMENT**; for those of peers and ambassadors, see **NOBILITY, AMBASSADOR**; for privileged communications, see **CONFIDENTIALITY, LABEL**; for the sacredness of the confessional, see **CONFIDENTIALITY**; see also **ALREST, DEBT, SANCTUARY, SOVEREIGN**.

Privy-council. Wherever a feudal system of government has prevailed it has been customary for the sovereign to summon, from time to time, a council of his barons or nobles to advise him in matters of state. This practice was adopted by feudal monarchs rather as a privilege than as a duty, since it gave them the means of enforcing from powerful feudatories an acknowledgment of their sovereign rights. The attendance of a baron at the court of his lord was a tacit admission of the suzerainty of the latter.

Under the early English kings the royal council was styled the *Aula* or *Curia Regis*. It consisted of the Chancellor, the Justiciary, the Lord Treasurer, the Lord Steward, the Chamberlain, the Earl Marshal, the Constable, and any other persons whom the king chose to appoint; the two archbishops belonged to it as of right; and the Comptroller of the Household, the Chancellor of the Exchequer, the Judges, and the King's Sergeants were occasionally present at its meetings. The authority of the curia was originally co-extensive with that of the king, in whom all the powers of government, judicial and administrative, were united; but its constitution gradually underwent a complete change. In the first place, a distinction came to be drawn between the body of the curia—the *magnam* or *commune concilium*, which was the germ of the modern parliament—and the *concilium assiduum*—a permanent committee of the curia, which was constantly and closely attached to the person of the king. Then the two councils were themselves subdivided. The Court of *secrarium*, or Court of Exchequer, which sprang from the *concilium assiduum*, took cognisance of affairs of finance, then of actions affecting the revenue, and lastly of civil suits generally. The Courts of King's Bench and Common Pleas—descended from the *magnam concilium*—respectively acquired their separate jurisdictions. These changes had been accomplished by the end of the reign of King John. They were merely successive delegations of the royal authority, and left the king's prerogative as

the fountain of law unaffected. In spite, therefore, of the establishment of regular tribunals, the sovereign still continued to exercise judicial authority, if not personally, at least through the agency of his chancellor and of the council, whose jurisdictions, afterwards so clearly distinguishable, were originally united. In the time of Edward III., however, the Chancery was rapidly becoming a separate tribunal; and by the end of the reign of his successor its establishment as the great court of equity had been effected. The *concilium assiduum*, also, had become a separate assembly of royal officials, bound by a particular oath and paid a regular salary, equally distinct from the courts of law and equity and from the *magnam concilium*, and regarded with no little jealousy by them both.

From the accession of Richard II. to the end of the reign of Henry VI. the Privy-council were not merely the servants but the ministers of the crown, and acted as a check upon the royal authority. While in theory the king could choose and dismiss the members of the council at his pleasure, the exercise of this prerogative was in fact subject to various restrictions. Some of the officers of the state were members of the council *ex officio*. The two archbishops claimed to belong to it as of right. The presence of other ecclesiastics, with whom the papal was a higher authority than the royal, introduced a further element of independence, and the occasional efforts of parliament to wrest the appointment of privy-councillors from the king made his influence over the council still weaker. The Privy-council exercised its control over the royal authority in two ways. Sometimes it merely advised and recommended. A more powerful kind of check was the refusal of the chancellor to affix the Great Seal to any royal grant of which the council disapproved. The English sovereigns endeavoured to defeat the operation of this check by the use of a privy-seal, and by retaining the Great Seal in their own hands. But the privy-seal passed into the custody of a separate official, and by the middle of the 15th century the council had succeeded in bringing every royal grant under its own notice at each stage in the procedure necessary for obtaining it. In the time of Henry V. the council assumed the name of Privy-council, by which it is now generally known. Its functions were then partly administrative and partly judicial. The former included the control of matters of finance, the establishment of *staples*—i.e. markets in which alone certain commodities could be exposed for sale—the regulation of the statutes which limited freedom of commerce between different parts of England, and the preservation of the peace. The latter cannot be better defined than in the words of Mr. Dicey: 'Whenever, in fact, either from defect of legal authority or from want of the might necessary to carry their decisions into effect, the law courts were likely to prove inefficient, then the council stepped in by summoning before it defendants and accusers.'

In the third or modern period of its history, which commenced when the Wars of the Roses were drawing to a close, the character of the Privy-council has undergone a variety of changes. The destruction of the feudal system, and the overthrow of the old ecclesiastical supremacy, reduced it to a position of absolute dependence on the crown. At the same time the power of the council as regards the state was greatly increased (1) by the subjection of particular places to its control—e.g. Ireland under Poyning's Act (1494), and the Channel Islands; (2) by the exercise of the right to issue proclamations; (3) by the erection of new courts under its supervision—e.g. the High Commission and the Court of Requests; and (4) by the extension of its judicial authority in the Court of

Star-chamber (q.v.). The judicial powers of the Privy-council were, however, restricted by the Long Parliament (16 Car. I. chap. 10, sect. 3), and in the 17th and 18th centuries its functions as the adviser of the crown in matters of government and state policy were gradually usurped by the Cabinet (q.v.).

Present Constitution and Functions.—The list of privy-councillors now includes the members of the royal family, the Archbishops of Canterbury and York, the Bishop of London, the great officers of state, the Lord Chancellor, the Lord Chief-justice of England, the Master of the Rolls, the Lord President and Lord Justice Clerk of Scotland, the Lords Justices of the Court of Appeal, the President of the Probate, Divorce, and Admiralty Division, the Lord Advocate of Scotland, the members of the Judicial Committee (see below), the Speaker of the House of Commons, the Ambassadors, the Commander-in-chief, the First Lord of the Admiralty, the Vice-president of the Board of Trade, the Paymaster of the Forces, &c., and necessarily all the members of the cabinet. Members of the council are in their collective capacity styled 'His [or Her] Majesty's Most Honourable Privy-council;' individually each member is styled 'Right Honourable.' (The Lord Mayor of London, although styled 'Most Honourable,' is not *ex officio* a privy-councillor. See *Notes and Queries*, first series, iii. 496; iv. 9, 28, 137, 157, 180, 236, 284; ix. 137, 158.) Under the authority of letters-patent dated 28th May, 10 James I. 1612, privy-councillors take precedence after Knights of the Garter. Amongst themselves they take rank according to seniority of appointment when no other principle of classification is applicable in the individual instances. Privy-councillors are appointed by the sovereign without either patent or grant, and are subject to removal at his discretion. By the common law, the Privy-council, as deriving its whole authority from the sovereign, was dissolved *ipso facto* upon the demise of the crown; but, in order to prevent the inconvenience of having no council in being at the accession of a new prince, it was enacted (6 Anne, chap. 7, sect. 8) that the Privy-council shall continue for six months after the demise of the crown, unless sooner determined by the successor of the deceased sovereign (cf. Stephen, *Comment.* vol. ii. p. 491). It is now understood that no members attend the deliberations of council except those who are specially summoned. In ordinary cases only the ministers, the great officers of the Household, and the Archbishop of Canterbury are summoned; but on some extraordinary occasions summonses are sent to the whole council. Thus, on November 23, 1839, the whole of the Privy-council were summoned to Buckingham Palace to receive Queen Victoria's announcement of her intended marriage with Prince Albert. Meetings of council are usually held at intervals of three or four weeks at the sovereign's residence; and six privy-councillors at least, with one of the clerks of council, constitute a meeting of council.

A privy-councillor must be a natural-born subject of Great Britain. His duties are defined by the oath of office as follows: (1) to advise the king to the best of his cunning and discretion; (2) to advise for the king's honour and good of the public, without partially through affection, love, need, doubt, or dread; (3) to keep the king's counsel secret; (4) to avoid corruption; (5) to help and strengthen the execution of what shall be resolved; (6) to withstand all persons who would attempt the contrary; and (7) to observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord. The personal security of a member of the Privy-council was formerly safeguarded by several statutes repealed by 9 Geo. IV. chap. 31.

Immediately on the decease of the sovereign the Privy-council assembles and proclaims his successor, the Lord Chancellor affixing the Great Seal to the proclamation. The members of the Privy-council are then re-sworn as council of the new sovereign, after which a privy-council is held, and the sovereign makes declaration of his designs for the good government of the realm, and subscribes the oaths.

The functions of the Privy-council in modern times depend on a great variety of statutes, and it is only possible here to give a brief and very general survey of the whole field. The subject is one full of confusion, partly because of the vast mass of detail which it involves, and partly because the long historical development which the Privy-council has undergone has borne its natural crop of legal fictions, anomalies, and technicalities. It will be convenient to divide our observations under four heads:

(1) *The Privy-council as synonymous with the Executive Government.*—It is a commonplace of constitutional law that the cabinet, which is the organ of the executive government, is quite unknown to the law. In theory the cabinet is only a committee or inner circle of the Privy-council, and the Privy-council is still the only instrument through which the sovereign can exercise his prerogative. But the theory no longer corresponds with the facts; the power is exercised by the cabinet alone, and the Privy-council is never consulted. This is the sense which must be attached to the statements that the 'sovereign in council' has wide authority in the colonies, can make and enforce laws in such colonies as have no representative assemblies, and can allow or disallow the legislative acts of such as do possess them. The case is the same with orders in council relating to blockades, reprisals, or embargoes. And, in harmony with these expressions, it is the regular course in acts of parliament conferring specific powers on the executive government to confer them in terms on the 'sovereign in council.' In such cases the mention of the council is purely formal, and if the power is exercised it will be by the ordinary government (cf. also 13 and 14 Vict. chap. 59, sect. 30). It may be added that, as the executive power is thus dependent on the authority of the legislature, so no executive act can be done, and no order in council can be made, which an act of parliament cannot override.

This is now a recognised mode in which the legislature delegates defined legislative functions to the executive; and it is on this principle that the Board of Trade, for example, can make regulations for carrying out the provisions of an act of parliament, though the act may simply state, 'It shall be lawful for His Majesty by order in council' from time to time to make such regulations.

(2) *The Privy-council as a separate Department of State.*—As the *aula regis* was the mother of parliament and of the various courts of law, so the Privy-council has given being, in quite recent times, to several administrative bodies (such, for instance, as the Board of Trade and the Local Government Board), to which many of its own administrative powers have been transferred. The different stages or methods in this process of differentiation are curious. The Board of Trade, established on its present basis in 1782, was at first, and still is in name, a committee of the Privy-council; it is defined in the Interpretation Act, 1889, sect. 12, as 'the Lords of the Committee for the time being of the Privy-council, appointed for the consideration of matters relating to trade and foreign plantations.' But for all practical purposes it is a distinct department of state, controlled by a president, who is a member of the government. The Board of Health created 1848, was ten years

later superseded partly by the Home Office, partly by the Privy-council. In 1871 the Local Government Board was created, in succession to the Poor-law Board, and to it were transferred many duties formerly exercised by the Privy-council in relation to the public health, such, for example, as the appointment and control of public medical officers and the carrying out of the Vaccination Acts. All the powers of the Local Government Board were in 1919 (9 and 10 Geo. V. chap. 21) transferred to the Ministry of Health. In 1889 a new Board of Agriculture was established, and took over the powers of the Privy-council in connection with the Destructive Insects Act and the Contagious Diseases (Animals) Act. Neither the Local Government Board, nor the Poor-law Board (which, created in 1847, ceased to exist, as we have already mentioned, in 1871), nor the Board of Agriculture was ever formally a committee of the Privy-council, but in each case a portion of the administrative functions of the council was transferred to the new department. The Ministry of Agriculture and Fisheries was constituted in 1919 (9 and 10 Geo. V. chap. 21). The Committee of Council on Education, established in 1839, remains in a different position. It has not been completely detached from the Privy-council and erected into a distinct department of the administration; and the member of the government who presides over it is still known as the President of the Board of Education. The law as to the functions of this department has been consolidated by the Education Act, 1921 (11 and 12 Geo. V. chap. 51).

In 1885 the Secretary for Scotland Act further transferred to the new secretary the powers and duties of the Privy-council in connection with the Board of Manufactures and the Public Health Acts so far as Scotland is concerned. The Secretary for Scotland was also entrusted with control over Scottish education, under the title of Vice-president of the Scottish Education Department, which is still nominally a standing committee of the Privy-council.

With regard to the administrative business which remains with the Privy-council as a separate department of state it must be remembered as a general principle that the work is actually done by permanent government officials, under the control of the Lord President of the Council, who is responsible to parliament and to the country. It is believed that this is substantially the case even when special committees are appointed by act of parliament for special administrative purposes. That the members of such committees are little more than advisers results naturally from the modern doctrine of ministerial responsibility. With this limitation, committees of the Privy-council exercise in many cases a delegated legislative power. For example, in the grant of charters to boroughs under the Municipal Corporation Act, 1882, every petition for a charter is referred to a Committee of Council, which has power to consider it, and to settle a scheme for adjusting the rights and liabilities of the existing local authority. Under the Medical Acts the Privy-council is entrusted with the supervision of the qualifications and the registration of medical practitioners; and kindred powers are conferred by the Pharmacy Act, 1868, and the Veterinary Surgeons Act, 1881. For the Committee of Council on Education, see EDUCATION. A Universities Committee of the Privy-council was constituted for England in 1877, and for Scotland in 1889 (see UNIVERSITIES).

The style under which administrative duties are imposed on the Privy-council varies. Sometimes it is referred to simply as the Privy-council; occasionally a clause is added that 'all powers vested in the Privy-council by this act may be exercised by an order in council made by two or

more of the Lords and others of H.M. Most Honourable Privy-council' (Veterinary Surgeons Act, 1881, sect. 18). Sometimes the duty is laid upon 'the Lords and others of H.M. Most Honourable Privy-council, or any three or more of them of whom the Lord President of the Council, or one of H.M. principal secretaries of state for the time being, shall always be one' (9 and 10 Vict. chap. 96).

(3) *The Privy-council in its widest Comprehension.*—The Privy-council, as a body, has in modern times no regular duties at all, administrative or judicial. Membership of it is a coveted honour, conferring rank, precedence, and titular dignity. It cannot, however, be fairly described as obsolete or dead, and on rare and abnormal occasions it has exercised powers not falling strictly within the sphere of ordinary legislative or judicial authority. Thus, the Privy-council in 1788 took on itself the duty of inquiring into the sanity of George III. and receiving the reports of the royal physicians. In 1821 it determined the constitutional question of Queen Caroline's right to be crowned as Queen Consort. But in general it is a force kept permanently in reserve, apart from the working elements of the constitution. And, as the character of British constitutional growth has ever been the adaptation of old expedients to newly felt needs, the possibility remains that some unforeseen constitutional convulsion may recall this ancient and honourable body from its merely nominal dignity to at least temporary life and usefulness.

(4) *The Judicial Committee of the Privy-council.*—The most important of all the offshoots of the Privy-council is the Judicial Committee. Officially it is merely a committee. In essence it is a court of law, possessing a wide and (indirectly owing to its connection with the Privy-council) a peculiarly elastic jurisdiction, which includes appeals from the ecclesiastical courts and, above all, appeals from Indian and colonial courts of law. The history of this last branch of the appellate jurisdiction of the Privy-council is exceedingly complicated, and cannot be entered upon minutely here. A few landmarks may, however, be indicated. Three distinct and conflicting theories have been promulgated upon the subject. (1) According to Pownall (*Administration of the Colonies*, 1774), when the necessity for an appeal from the decisions of the colonial governors, who, although not properly qualified lawyers, were yet called upon to preside in the courts of law, was clearly apprehended, the one precedent of a judicature within the realm possessing foreign jurisdiction which presented itself to the minds of the English sovereign and his advisers was that of the jurisdiction of the Privy-council over the Channel Islands. Since the time of King John (1204) appeals from the royal courts in Jersey and Guernsey—with the latter of which Alderney and Sark were for judicial purposes united—had been brought before the king and his council in England. Now the English sovereign claimed—a claim which the colonists acquiesced in, and which the House of Commons itself had tacitly admitted—that his colonial settlements and possessions were the demesnes of the crown, lying quite beyond the jurisdiction or cognisance of the state. The historical relation between the feudal duchies of King John and the royal plantations and possessions abroad being so intimate, no great effort of administrative imagination was necessary to make the analogy complete. Thus it came to pass that appeals from the courts constituted in the various colonies were taken not to the House of Lords, nor to the courts of law and equity, but to the king in council. (2) A second theory is suggested by Macqueen—viz. that the Privy-council originally entertained colonial petitions under the authority of a reference from the peers,

and that, when the intervals, gradually becoming longer, between the sessions of parliament rendered this mode of redress unsatisfactory, the council came to discharge in their own right those functions which would have been delegated to them by the peers if parliament had been summoned. (3) The statute 25 Hen. VIII. chap. 9 appears to suggest a third explanation of the origin of the appellate jurisdiction of the Privy-council. Under that act, a subject aggrieved by the decision of any court in any part of the king's dominions might appeal to the king in chancery. Every such appeal was referred by commission under the Great Seal to the Court of Delegates, the decisions of which were, in spite of a distinct prohibition in a statute of Elizabeth, reviewed upon petition by the Privy-council. One central fact, the right of the sovereign to entertain an appeal from any colonial court, is undisputed and indisputable. We know that, in less than a century, the body to which the crown entrusted the administration of colonial affairs was repeatedly reconstituted, and there is no reason why the *judicature* for colonial appeals may not have undergone similar changes in the course of three centuries. The statute 2 and 3 Will. IV. chap. 92 transferred to the king in council the jurisdiction of the Court of Delegates; 3 and 4 Will. IV. chap. 41 formally created the judicial committee, and vested in it all the judicial authority of the Privy-council, the Commissioners of Appeals in prize causes, and the Court of Delegates. The judicial committee comprises the Lord President of the Council, the Lord Chancellor, the Lords Justices, and such other members of the Privy-council at large as shall hold or shall have held certain judicial or other offices enumerated in the acts. By 34 and 35 Vict. chap. 91 Queen Victoria was empowered by order in council to appoint by warrant under her sign-manual four additional *paid* judges, each being, or having been, a judge of one of the superior courts at Westminster or Chief-justice of Bengal, Madras, or Bombay, to act upon the judicial committee. Under the Appellate Jurisdiction Act, 1876 (sect. 14), provision was made for the substitution of two additional 'lords ordinary of appeal' for the four paid judges appointed under 34 and 35 Vict. chap. 91, and thus for the ultimate merging of the judicial committee in the House of Lords—a reform which the proposals at the colonial conference of 1910 for the creation of an Imperial Court of Final Appeal once more brought into prominence. By the Judicial Committee Amendment Act, 1895 (and see the Appellate Jurisdiction Act, 1913), it was provided that the judges of certain self-governing colonies should, if members of the Privy-council, be members of the judicial committee. Provision has also been made for certain colonial judges acting as assessors to the judicial committee (Appellate Jurisdiction Act, 1908).

The customary conditions of appeal from colonial courts to the Privy-council are that the amount at stake should exceed a certain sum in value, that leave to appeal should be asked from the court below within a certain time after the date of the judgment appealed against, and that proper security should be found. It is, however, the inherent prerogative right, and on proper occasions the duty, of the king in council to exercise an appellate jurisdiction over *all* colonial courts and in all colonial cases, civil as well as criminal. In the exercise of this jurisdiction, and in the absence of any charter or statutory right, the sovereign in council may grant special leave to appeal in *civil* cases of substantial, general, or constitutional importance, where the judgment appealed against was plainly wrong or attended with sufficient doubt to justify the judicial committee in recommending that

it should be reviewed, and in *criminal* proceedings, where it is shown that by disregard of the forms of legal process, by some violation of the principles of natural justice, or otherwise, grave and substantial injustice has been done.

The decisions of the judicial committee are pronounced by one member of the committee only, and not, according to the usual practice in divisional courts, the court of appeal, and the House of Lords, by each of the presiding judges; and an order in council of 4th February 1878 prohibits any publication from being made by members of the committee as to how the particular voices and opinions went.

The Lord President of the Council is the fifth great officer of state, and is appointed by letters-patent under the Great Seal. The office is very ancient, and was revived by Charles II. in favour of the Earl of Shaftesbury in 1672.

Scotland once had a Privy-council of its own, but it was merged in that of England by 6 Anne, chap. 6. There was a separate Privy-council for Ireland, whose members were sworn pursuant to a sign-manual warrant directed to the Lord lieutenant. The Privy-council of Ireland has been replaced in Northern Ireland by the Privy-council of Northern Ireland, and in Southern Ireland by the Executive Council of the Irish Free State. There is an appeal from the Irish Free State to the Privy-council by special leave.

See Dicey's *Privy-council* (1860; new ed. 1887); Hearn's *Government of England* (ed. 1887); Macpherson's *Practise* (1860; new ed. 1873); Macqueen's *Appellate Jurisdiction of the House of Lords and the Privy-council* (1842); Safford and Wheeler's *Privy-council Practise*.

Privy-seal. See SEAL.

Prize, property captured from an enemy; but the term is generally applied exclusively to property taken at sea. As between the belligerent powers themselves the property in a ship or other thing captured passes at once by the mere capture to the captor. Up to the close of the Crimean war all property of an enemy even when carried in a neutral ship was liable to capture, as also was the property of a neutral if captured on board a belligerent ship. This involved a claim to the right of searching neutral ships, a claim which Britain was only able to enforce during the great war with France in consequence of her mastery of the sea; it was a right, however, which was continually being disputed, and the enforcement of it in the case of American ships led repeatedly to difficulties with the United States. When the treaty of Paris was signed in 1856 it was universally agreed that private property in neutral bottoms so long as it is not contraband of war should no longer be liable to capture (see NEUTRALITY, ENEMY, BLOCKADE). In naval cases, a ship taken must be sent to a port belonging to the capturing power, where the Court of Admiralty, on full evidence, adjudicates whether she be lawful prize or not. If the decision be affirmative the prize is then sold. The dock dues, stevedores' wages, lawyers' expenses, and brokers' fees for selling cargoes and ships are deducted from the produce of the sale; the rest is lodged in the hands of the Accountant-general of the Navy.

Prize-money.—Previous to August 1914 the prize-money arising from the capture of a ship was distributed among the officers and men of the ship or ships taking part in the capture. But the circumstances of the Great War, in which a few ships captured many prizes, whilst other men-of-war were engaged in other military operations away from the trade-routes, led to Mr Winston Churchill, then First Lord of the Admiralty, having an order in council, dated 28th August 1914, issued which

cancelled the above-mentioned system of distribution, and declared in lieu thereof the intention to substitute a system of gratuities for more general distribution to the officers and men of His Majesty's naval forces. The Naval Prize Act, 1918, set up a tribunal whose functions were to review all cases dealt with in the prize court, and the net proceeds of all such as they declared to be droits of the crown were transferred to the naval prize fund for distribution amongst the officers and men of His Majesty's fleet. Eligibility for a share in the prize-money consists of service in a sea-going ship of war, including offensively armed auxiliary vessels, which include armed boarding-steainers, trawlers and drifters, &c. Trained pilots and observers and the crews of naval airships and others who fly continuously at sea are eligible whilst they are borne on the books of one of His Majesty's ships and attached to a naval air-station. Examples of shares are as follows: Commander-in-chief, Grand Fleet, 1000; admiral commanding-in-chief, 850; vice-admiral commanding a squadron, 600; rear-admiral commanding a squadron, 400; a senior captain in command, 160; captain's rank, 40; commander's rank, 30; lieutenant's rank, 20; warrant officer, 12; midshipmen and chief petty officers, 10; naval cadet and petty officers, 8; able seamen, 5; boy, 3. Warburton's *Prince Rupert* (vol. iii.) gives an interesting distribution of prize-money in the 17th century.

Prize Bounty is a grant to the officers and crews of such of His Majesty's ships of war as are actually present at the taking or destroying of any armed ship of the enemy. The amount to be distributed is calculated at the rate of £5 for each person on board the enemy's ship at the beginning of the engagement. Prize bounty shares are similar to those for prize-money, except in the cases of flag officers, who get more—e.g. Commander-in-chief, Grand Fleet, 2000; admiral commander-in-chief, 1250; vice-admiral commanding a squadron, 750; rear-admiral commanding a squadron, 500.

Prize-court. See ADMIRALTY COURTS.

Prize-fighting. See PUGILISM.

Prizren, a rich and industrious town 40 miles WNW. of Skopljë, gained by Serbia from Turkey in 1912-13. It was the scene of a Bulgarian victory over the Serbs in 1915. Pop. 16,000.

Prjevalski, NICHOLAS, Russian traveller, was born in the government of Smolensk on 31st March 1839. He entered the army (1855), and took part in quelling the Polish insurrection of 1861. Having joined the general staff in 1867, he was moved to Siberia. There he began to satisfy his longing for travel by exploring the Ussuri region, south of the Amur. This, however, was a small thing in comparison with his subsequent labours in geographical exploration. The three years 1871-73 he spent in travelling from Peking through southern Mongolia (region of the Ordos) to the Ala-shan, Koko-nor, and the upper waters of the Yang-tze-Kiang. Four years later he made the first of the journeys undertaken with the hope of reaching Lhasa, the goal of all his subsequent efforts. He rediscovered Loh-nor, but failed three times in the same year to penetrate into Tibet. Two years afterwards he once more set out, and, after crossing the difficult highland region between East Turkestan and Tibet, had reached a point some 160 miles north of Lhasa, when the Tibetan authorities turned him back. He then went east, and explored the upper course of the Hoang-ho for about 200 miles, and finally reached Kiakhta after a journey of nearly 15,000 miles. In the winter of 1883-84 he once more crossed the Desert of Gobi, and got as far as the upper Yang-tze-Kiang, but, not being able to cross it or travel down it, was

obliged to return. He died at Karakol, on the east side of Lake Issykkul in West Turkestan, just starting on his fifth expedition, on 1st November 1883. Prjevalski brought back from these journeys most valuable collections of animals and plants, now all preserved at St. Petersburg, amongst other things that he discovered were the wild camel and the wild horse, the ancestors of the domesticated varieties. His accounts of his journeys were published in the *Proceedings* of the St. Petersburg Geographical Society, in *Petermann's Mittheilungen*, and other journals, as well as in two independent Russian works (1875 and 1883).

Proa (Malay *prahu*), sometimes known as the 'flying proa,' is a peculiarly-shaped canoe in use by the natives of the Malay Archipelago, and on the China Seas, especially by the Ladrone Islanders. It is about 30 feet in length by 3 in width, and has the stem and stern equally sharp, so as to sail backward or forward without being turned round.

Proa.

One side is flat, and in a straight line with the stem and stern; the other side is rounded, as in ordinary boats. This peculiar formation would make it liable to be easily upset, were it not for a framework which projects to windward, supporting a weight which counterbalances the pressure of the wind on the sail. The sail resembles the ordinary lug-sail, and is formed of mat. Slight variations from this form are found, but the principle of construction is the same.

Probabilism. See CASUISTRY.

Probabilities, CHANCES, or the THEORY OF AVERAGES. To assign a number which measures the probability of a future event may at first seem impossible; and yet the whole business of many large companies instituted in every civilised country for the 'insurance' or 'assurance' of lives, &c. is mainly based upon the methods of assigning such a number. When it is certain that a future event will take place, or will not take place, a fixed number is selected for each case to indicate that then the probability amounts to certainty: and these two measures are the limits of our scale. Will the sun rise to-morrow morning in the east? Probability = 1, certainty in favour. Will full moon be seen to-morrow morning in the east? Probability = 0, certainty against. Between these two limiting numbers, 0 and 1, lies the number (a proper fraction) which measures the probability of any undecided event. The number, then, by which we mark the chance, or expectation, or probability of anything occurring in the future, must be a fraction like $\frac{2}{3}$, $\frac{1}{2}$, or $\frac{1}{273}$, and can never be so large as 1, which was fixed as the higher limit, certainty; and by the fractional number assigned to any event we can readily compare its probability with those of other future occurrences.

To assign the proper fraction to any future event will, in general, imply knowledge of a large

number of similar events. Thus, in January, what is the probability that on next 12th April the sun will rise bright and unclouded? Relying on the constancy of nature and the doctrine of averages, we consult the calendars and weather-noticees of the last 50 years, say, and find that in 17 of these the result was favourable and in 33 unfavourable. On these data the probability required is $\frac{17}{50}$, rather over $\frac{1}{3}$. In other words, the odds are nearly 2 to 1 against the event. The fraction $\frac{17}{50}$ measures or shows the probability that the event will *not* happen. More generally, if any future event may occur in 12 ways and fail in 15 ways, then the probability of its occurring is $\frac{12}{12+15} = \frac{4}{7}$; and the

probability of failure, $\frac{15}{12+15} = \frac{5}{7}$. In such a case the 27 ways are supposed to have each the same chance of occurrence: and, since the event must either happen or fail, the sum of the two probabilities = certainty—i.e. $\frac{4}{7} + \frac{5}{7} = 1$. Thus, if $\frac{4}{7}$ is the chance of an event, $1 - \frac{4}{7} = \frac{5}{7}$ = chance that it will not occur. In a certain town only 4 days of May—taking the average of many years—are rainless: what will be our chance of finding next 15th May rainless? Chance = $\frac{4}{7}$; and $1 - \frac{4}{7} = \frac{5}{7}$ = chance of having rain. The principle involved in such simple solutions is the foundation of the mathematical treatment of chance or probability. Of all the occurrences, all equally possible, which relate to a future event, if a are favourable and x unfavourable, then $p = \frac{a}{a+x}$,

where p stands for probability of the event occurring. Sometimes it is easier to find the probability of the event failing, and subtract that result from 1 as in the examples just given.

Out of 100 sailors who untinted there were 10 ringleaders. If 2 are selected by lot for capital punishment, find the chance that both will be ringleaders. The total number of pairs is $\frac{100 \cdot 99}{1 \cdot 2} = 4950$, and the number of pairs among the ringleaders is $\frac{10 \cdot 9}{1 \cdot 2} = 45$. Hence chance required = $\frac{45}{4950} = \frac{1}{110}$; i.e. the odds are 109 to 1 against the event. A bag contains 5 sovereigns and 4 shillings: if a child is asked to draw three coins at random, what is the probability that 2 will be sovereigns and 1 a shilling? Here the total number of groups of 3 which can be formed out of all the 9 coins is $\frac{9 \cdot 8 \cdot 7}{1 \cdot 2 \cdot 3} = 84$, which

forms our denominator. Of the sovereigns there are $\frac{5 \cdot 4}{1 \cdot 2} = 10$ pairs, each of which may be drawn with each of the 4 shillings, giving 40 groups of 3, which forms our numerator. Hence chance required is $\frac{40}{84} = \frac{10}{21}$; i.e. the odds are 11 to 10 against the event.

Sometimes actual trial seems to throw discredit on the mathematical measure of a chance. Thus, if a die be thrown, the chance of a 5 or any other number turning up must be $\frac{1}{6}$ by our definition: whereas a person may cast a die, say 20 times in succession, with the result: ace, 4 times; 6 and 4, each 3 times; 2 and 3, each 5 times; 5 not at all. How then explain the mathematical estimate? Simply that 20 is much too small a number to take an average from, and the result 'chance = $\frac{1}{6}$ ' for each side of the die refers to the most general case possible—i.e. a very large number or even an infinite number of throws. Register for 10,000 throws, then for 100,000 or 1,000,000, and the results would more and more approximate to the mathematical result, and prove that each side has chance = $\frac{1}{6}$ —the die being of course a perfect cube.

An important extension of the theory is that the probability of two independent events *both* occurring is measured by the product of their separate probabilities. Thus, if A's chance of passing a certain examination is $\frac{1}{2}$ and B's $\frac{1}{3}$, then (1) the chance that *both* will pass is $\frac{1}{2} \times \frac{1}{3} = \frac{1}{6}$ —i.e. the odds are 7 to 5 against; (2) the chance that *both* will fail is $(1 - \frac{1}{2})(1 - \frac{1}{3}) = \frac{1}{3}$; (3) the chance that A passes and B fails is $\frac{1}{2}(1 - \frac{1}{3}) = \frac{1}{3}$; and (4) the chance that A fails and B passes is $(1 - \frac{1}{2})\frac{1}{3} = \frac{1}{3}$. By comparing these four results we see that the last event is the most probable of all, the odds being 25 to 24 in favour of it. Moreover, these results exhaust the possible alternatives of double event, therefore the four probabilities should together amount to certainty: and $\frac{1}{6} + \frac{1}{3} + \frac{1}{3} + \frac{1}{6} = 1$, Q.E.D.

By the same principle we solve many useful and curious problems. A town-council of 20, 12 Liberals and 8 Conservatives, have to choose a deputation of 5 by ballot: find the probability that it will contain 3 Liberals and 2 Conservatives. Total number of groups of 5 is

$\frac{20 \cdot 19 \cdot 18 \cdot 17 \cdot 16}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5} = 15504$, or $\frac{19 \cdot 3 \cdot 17 \cdot 16}{1 \cdot 2}$, which forms our denominator. Number of groups of 3 from the Liberals is $\frac{12 \cdot 11 \cdot 10}{1 \cdot 2 \cdot 3} = 220$, and number of

pairs of the Conservatives is $\frac{8 \cdot 7}{1 \cdot 2} = 28$; therefore, multiplying $2 \cdot 11 \cdot 10 \cdot 4 \cdot 7 = 6776$ = total number of groups of 5 which fulfil the conditions; and required probability is $\frac{6776}{15504} = \frac{19 \cdot 3 \cdot 17 \cdot 16}{19 \cdot 3 \cdot 17 \cdot 16}$, or more than 3 to 2 against the event.

When a person buys lottery tickets his chance of success is found as in our opening paragraphs, and if multiplied by, the value of the money attainable the product is called his 'expectation.' In this connection may be noted an important distinction between the moral and mathematical values of 'expectation,' owing to the assumption that in such speculations the loss of money paid for tickets is not to be regarded. If one man of moderate means risks £500 in order to gain £5 when the odds are 100 to 1 in his favour, and another risks £5 to gain £500 when the odds are 100 to 1 against, the speculation in the former case appears much more reckless and immoral than in the latter, although in both cases the stake is exactly equal to the expectation.

We now reach the most important of all the applications of the theory of probability, its use in the calculation of life insurances and annuities. During the early part of the 18th century the celebrated London mathematician De Moivre constructed a formula of great simplicity which is still available, although largely superseded by elaborate 'tables of mortality' which have since been compiled in all commercial countries. By De Moivre's hypothesis, out of 86 children born at the same time 1 dies every year until all are extinct. Thus, for a man 40 years old, $86 - 40 = 46$, 46 years on an average are still before him and 45 others; and his chance of life is the average number between 0 and 46—i.e. $\frac{1}{2} \times 46 = 23$. Generally a person's probability of life or expectation is $\frac{1}{2}(86 - x)$, where x is the present age. Actuarial writers have found that this simple formula agrees with their official tables, except in the case of young children and aged persons. The tables are based upon long-continued observations of the mortality in the class of persons dealt with, and from them the theory of probability is easily applied in calculating annuities, reversionary payments, and other results.

For ascertaining the various life contingencies the Institute of Actuaries employ a table giving all the ages from 10 upwards, and, beginning with 100,000 persons alive at the age of 10, place opposite each succeeding age the number of survivors, till at 98 years none are left. At 40, survivors = 82,284; at 50, survivors = 72,726; therefore the chance that a man of 40 shall live to 50 is $72,726 \div 82,284 = .884$. The Belgian tables give .832 for the same event in the case of a married man living in town; and if his wife is 30 years older her chance of surviving for ten years is .862. These data give the following calculation of the chances of the four double events occurring 10 years hence:

Both being alive	$.832 \times .862 = .717$
Both dead	$(1 - .832) \times (1 - .862) = .023$
Husband alive only	$.832 \times (1 - .862) = .115$
Wife alive only	$(1 - .832) \times .862 = .145$

As we have seen already the sum of these four probabilities must = 1, which verifies the reckoning. The chance of both these persons being alive is evidently more than $\frac{1}{7}$ —i.e. the odds in favour are better than 7 to 3.

Some of the higher applications of the doctrine of probability require a knowledge of the infinitesimal calculus, and are of interest only to experts. It is proved, for example, by integration and the theory of averages that the mean latitude of all places north of the equator is 32.704° ; and when four points in the circumference of any circle (radius = r) are taken at random, the mean area of the quadrilateral so determined is $3r^2 = r^2 \times .955$.

There are works on the subject by De Morgan (1837), Boole (1854), Todhunter (1865), Venn (1866), Whitworth (1886), Procter (1887), and Poincaré (1896).

Probang, an instrument of various shape and material, for pushing obstructions down the oesophagus of a choking animal. See **CHOKING**.

Probate Court, a court created in England in 1858, in lieu of the old Prerogative Courts, to exercise jurisdiction in matters touching the succession to personal estate. Since the Judicature Acts of 1873-75 the Probate Court is included in the Probate, Divorce, and Admiralty Division of the High Court of Justice. If a man at his death leaves a will, then it must be produced and verified so as to prove that it is an authentic will, duly executed and signed in presence of witnesses, and therefore that the right to the personal estate is vested in the executors named by the will. The will is proved in common form by depositing it in one of the registries of the court, by making affidavit of the amount of the property, and by paying a duty varying according to the amount of the property and nearness of kin to the deceased (see **DEATH DUTIES**). The executors receive a copy of the will, accompanied by a grant of administration; and this probate copy is usually shown to bankers, &c. when the executors lay claim to the property of the deceased. If the authenticity of the will is disputed it must be proved by witnesses in court. If there is no will the personal estate devolves on the next of kin and widow, if any; and it is necessary that an application be made to the court to appoint an administrator. This is called taking out administration, and the act of the court appointing administrators is called letters of administration.

Probationer, one who is on probation; especially, in Scotland, a divinity student who, having completed his studies and performed the prescribed exercises, is licensed to preach by the presbytery, and is entitled to become a candidate for a pastoral charge.

Proboscidea. See ELEPHANT.

Proboscis Monkey (*Nasalis larvatus*), a native of Borneo, one of the dog-like (Cynomorph) Catarrhines, nearly allied to the genus Semnopithecus. The nose is very long, especially in the old males, and is mobile and retractile like a proboscis. In the young monkeys it is short and

Proboscis Monkey (*Nasalis larvatus*).

blunt. There are bushy whiskers, which, with the long hair on the back of the head, encircle the neck. The colours—brown, red, yellow, and gray—are bright. The adult males are about 3 feet in height; the body is lank, and the tail is very long. In habit these animals are arboreal and gregarious.

Probus, MARCUS AURELIUS, emperor of Rome, was born at Sirmium, in Pannonia, early entered the army, and had the good fortune to attract the favourable notice of the Emperor Valerian. His subsequent conduct justified his rapid promotion, for he greatly distinguished himself on the Danube, and in Africa, Egypt, Asia, Germany, and Gaul. By the Emperor Tacitus he was appointed governor of the Asiatic possessions of Rome; and such was the zealous attachment evinced for him by his soldiers that on the death of Tacitus they forced him to assume the purple; and, his rival Florianus having been removed, Probus was enthusiastically hailed emperor by all classes (276 A.D.). His brief reign was signalised by brilliant and important successes; the Germans were driven out of Gaul, and the Barbarians from the Rhaetian, Pannonian, and Thracian frontiers; and Persia was forced to agree to a humiliating peace. The external security of the empire being established, Probus devoted himself to the development of its internal resources. But fearing that the discipline of the army would be deteriorated by inactivity, he employed the soldiers as labourers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent; and a large body of troops engaged in draining the swamps about Sirmium murdered their excellent emperor in 282.

Process Engraving. See ILLUSTRATION, PHOTOGRAPHY.

Procession of the Holy Spirit. See SPIRIT, CREDS.

Processions, as solemn and religious rites, are of very great antiquity. With the Greeks and Romans they took place chiefly on the festivals of Diana, Bacchus, Ceres, and other deities; also before the beginning of the games in the Circus; and in spring, when the fields were sprinkled with holy water, to increase their fertility. The priests went at their head, bearing images of the gods and goddesses to be propitiated, and started either from

certain temples or from the Capitol. Among the Jews certain processions around the altar were—and still are to a certain extent—usual on the Feast of Tabernacles; and from them the Mohammedans have adopted their mode of encompassing the sanctuary seven times at Mecca. Processions also form a prominent part of the Buddhist worship. The practice was early introduced into the Christian church, but seems to have been adopted by Chrysostom at Constantinople to counteract the influence of the Arian processions through the streets to their churches outside the walls. Ambrose speaks of them as ancient in his day. During the middle ages processions were arranged on a scale of great magnificence, as at the Corpus Christi Festival. Since the Reformation they have been much less elaborate, especially in mixed countries; but at Vienna, and still more at Munich, the Corpus Christi procession is still magnificent. Processions are either Supplicatory or Cross processions, and are either directed to a certain distant place, to some miraculous image or object, or they are confined to the streets of the cities and the churches. Banners, crosses, and images are generally carried in front; the clergy follow; and the people make up the rear, singing hymns or reciting prayers. Processions to beseech the special mercy of God are variously to be described as *Litanæ*, *Rogationes*, *Strætes*, *Supplicationes*, and *Eremologues*; and again, they are to be distinguished as being with or without the Blessed Sacrament, relics, or images of the Virgin or Saints. Some are extraordinary and specially arranged; others are ordinary and fall under the common ritual, as those on Candlemas, Palm Sunday, St Mark's Day, three Rogation days, and at funerals. The Processional is the service-book containing the prayers, hymns, and ceremonial of processions. There is no doubt that, whatever their general intrinsic value, they offer in many instances one of the most strikingly picturesque features of the Roman faith, and that they answer a certain instinctive craving of the multitude. Processions through the streets are frequent in modern life as political and social demonstrations, as during strikes and the like, and, when not decreed dangerous to order or obstructive to traffic, are claimed as a privilege of free-born citizens; and they have been introduced to break the quiet of many English towns and villages as part of the peculiar warfare of the Salvation Army. For extensive pilgrimages, as such, their history and rites, see PILGRIM, MECCA, FESTIVALS, &c.

Prochein Ami. See INFANT.

Pro'cida, an islet of Italy, between the island of Ischia and the mainland (Cape Miseno), 12 miles W. by S. of Naples. Area, 1½ sq. m.; pop. 10,700. On its shores is the city of the same name, with a harbour, a royal palace, a state-prison, and a marine school. The people fish coral, limny, and sardines, and grow fruits, wine, and oil. The island was occupied by Britain on two or three occasions between 1799 and 1813.

Proclamation, a public notice given by the sovereign or governing power to the people. The power of issuing proclamations is part of the prerogative of royalty as the fountain of justice. They sometimes consist of an authoritative announcement on some matter of state, or act of the executive government affecting the duties and obligations of subjects. The demise of the crown, and accession of a new sovereign, a declaration of war, and the issue of new coin are all occasions on which a royal proclamation is issued. In time of war, the crown by a proclamation may lay an embargo on shipping, and order the ports to be shut. But the most usual class of proclamations are admonitory notices for

the prevention of offences, consisting of formal declarations of existing laws and penalties, and of the intention to enforce them; such as the proclamation against vice and immorality, formerly read at the opening of courts of assize and quarter sessions in England. In Scotland proclamations summon the Scottish peers to elect representatives to the House of Lords.

Proclamations are binding when they enforce the execution of laws already in being. Towards the end of Henry VIII.'s reign it was enacted that the king's proclamation should have the same force as an act of parliament; but this ill-judged law was repealed in the first year of Edward VI. It is now clear that the sovereign can neither make a new law, nor dispense with the existing law, unless by consent of parliament. A meeting which is proclaimed is not thereby rendered illegal; the proclamation is only a notice that, in the opinion of the government, the meeting is likely or certain to assume an illegal character. Proclamations are issued under the Great Seal, and are read aloud by heralds or other royal officers in the capital cities of the United Kingdom; the reading is prefaced with a fanfare of trumpets.

Proclus, the Neoplatonist, called the Successor (*Diadochos*), i.e. of Syrianus, as the head of the Athenian school, was born in Constantinople about 411 A.D. He was of Lycian origin, and received his first instruction at Xanthus, in Lycia. He then studied at Alexandria under Arius, Leonidas, Hero, and especially under Heliodorus, with whom he applied himself chiefly to Aristotelian and Platonic philosophy. Thence he went to Athens, where a certain Plutarch, a philosopher, and his daughter, Asclepiogeneia, a priestess of Eleusis, became his instructors, chiefly in theurgic mysteries. The vivid imagination and enthusiastic temperament which in his childhood already had led him to believe in apparitions of Athena and Apollo, naturally convinced him, when all the influences of the mysteries were brought to bear upon him, still more of his immediate and direct intercommunication with the gods; and he came to distinctly believe himself one of the few chosen links of the Hermetic chain through which divine revelation reaches mankind. His soul had, he thought, once lived in Nicomachus the Pythagorean, and, like him, he had the power to command the elements to a certain extent, to produce rain, and to temper the sun's heat. The Orphic Poems, the writings of Hermes, and all the mystical literature of that occult age were to him the source of true philosophy, and he considered them all more or less in the light of divine revelations. That same cosmopolitan spirit in religious matters which pervaded Rome towards her end had spread throughout all the civilised pagan world of those days, and Proclus distinctly laid it down as an axiom that a true philosopher must also be a microphant of the whole world. Acquainted with all the creeds and rites of the ancient Pantheons of the different nations, he not only philosophised upon them in an allegorising and symbolising spirit, as many of his contemporaries did, but practised all the ceremonies, however hard and painful. More especially was this the case in the severity of his fasting in honour of Egyptian deities—a practice, which, if it fitted him more and more for his hallucinations and dreams of divine intercourse, on the other hand more than once endangered his life. Of an impulsive piety, and eager to win disciples from Christianity itself, he made himself obnoxious to the Christian authorities in Athens, who, in accordance with the spirit of religious intolerance and fanaticism which then began to animate the new and successful religion against which Proclus waged

constant war, banished him from this city. Allowed to return, he acted with somewhat more prudence and circumspection, and only allowed his most approved disciples to take part in the nightly assemblies in which he propounded his doctrines. He died in 485, in his full vigour, and in the entire possession of all those mental powers, for which he was no less remarkable than for his personal beauty and strength.

As to his system, some modern philosophers have exalted it to an extent which his own writings scarcely warrant. Victor Cousin holds that he has concentrated in it all the philosophical rays which emanated from the heads of the greatest thinkers of Greece, such as Pythagoras, Plato, and Aristotle. The predominant law of development is *triadic* in character. The existence of what is produced in that which produces it, its emergence from it, and its return to it (*ἡ ἀρχή, ἡ πρόοδος, ἡ επιστροφή*) are the three moments, by the continued repetition of which the totality of things is developed from their origin. The final source of this development is the original essence, elevated above all being and knowledge, between which and the intelligible there intervenes an intermediary member—the absolute unities (*ἀντικεινὰς ἐνάδες*), together forming the single supernal number. Next to this comes the three spheres of the intelligible, the intellectual-intelligible (*νοερὰν ἑκατὰ καὶ νοερὰν*), and the intellectual. The chief property of the first is being; of the second, life; of the third, thought. Of these spheres the first two are again divided into three triads each, and the triad again into hebdomads, each separate member regarded as a divinity. The soul is made of three kinds of part-souls—divine, demonic, and human. Of these the divine fall into three orders: the four triads of hegemonic gods, an equal number of gods free from the world (*ἀσώτῳτοι*), and the gods within the world, who are divided into star-gods and elementary gods. The demons are divided into angels, demons proper, and heroes. The soul enters temporarily into the material body, but it does not create matter, which comes directly from the unlimited—with the limited and the mixed, the components of the first intelligible triads. Space he considers as a body consisting of the finest light, which body penetrates that of the world. He distinguishes the principle of unity or divinity in the soul from thought or reason. It is capable by divine illumination of mystic union with the Deity. Indeed, faith alone is essential to the attainment of Theurgy, which, comprising mantic and supernatural inspiration, is preferable to all human wisdom; and in this Proclus chiefly differs from Plotinus, with whose system he agrees in most other respects.

There is no edition of the complete works of Proclus, but that of Victor Cousin (6 vols. 8vo. Paris, 1820) contains the *Commentaries on the First Alcibiades* and the *Parmenides*, and the treatises *De Libertate*, *Providentia*, et *Malis* (in a Latin translation); his second edition (1 vol. 4to, 1864) contains in addition to those the *Hymns*. Thomas Taylor, 'the Platonist', published in 1788 89 translations of the *Commentary on Euclid*, with the *Life* by Marinus; the *Six Books on the Theology of Plato* in 1816; the *Commentaries on the Timæus* in 1820; the *Fragments on the Lost Writings* in 1825; *On Providence*, and *On Evil*, in 1833. The *Commentaries on Plato's Timæus*, several times edited, was the one among his treatises that Proclus esteemed most highly. See NEOPLATONISM.

Proconsul, a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul, not, however, extending over the city and its vicinity. The proconsul was, at first, one who had held the office of consul, whose *imperium* was prolonged to enable

him to bring an unfinished campaign to a close. The duration of the office was a year. During the later period of the republic, when the consuls were expected to spend the year of their consulate at Rome, they were generally appointed at its close to undertake as proconsuls, either the conduct of a war in some province, or its peaceful administration. Occasionally the office of proconsul, with the government of a province, was conferred on a person who had never held the consulship. Under Constantine parts of certain dioceses came to be governed by proconsuls.

Procop. ANDREW, the Hussite leader, was born in 1380. Originally a monk, he served under Ziska, and on Ziska's death became commander of the Taborites. It was under his command that the fearful raids into Silesia, Saxony, and Franconia were carried out (see HUSS), and he repeatedly defeated German armies. He and his colleague, Procop the Younger, headed the internal conflict of the Taborites with the more moderate Calixtines; and in the battle with the Bohemian nobles at Lipan, near Böhmischbrod, on the 30th May 1434, both the Taborite commanders fell.

Procopius, the most eminent of the Byzantine historians, was born at Caesarea, in Palestine, towards the close of the 5th century, and, having studied law, was taken by Belisarius in his train when he led the Roman armies against the Persians (526 A.D.), the Vandals in Africa (533), and the Ostrogoths in Italy (536). He appears to have displayed remarkable practical as well as literary talent, for he was on two occasions placed at the head of the commissariat. Returning to Constantinople shortly before 542, he was highly honoured by Justinian, and appointed prefect (if it was this Procopius) of the metropolis in 562. His death occurred, it is thought, about three years later. Procopius's principal works are his *Historia* in eight books (two on the Persian war, from 498 to 550; two on the war with the Vandals, from 532 to 546; and four on the Gothic war, going down to 552); *De Edificiis*, or six books on the buildings executed or restored by Justinian; and *Anecdota*, or *Historia Arcana*, a sort of *chronique scandaleuse* of the court of Justinian, in which the emperor, his wife Theodora, Belisarius, his wife Antonina, and other distinguished persons, are depicted in the darkest colours. The most valuable of these productions is undoubtedly the first, in which Procopius writes with the clearness and fullness of knowledge that might be expected of a man who had been an eye witness of much of what he narrates, and who had occupied a position that fitted him to understand thoroughly what he had seen. He is the chief authority for the reign of Justinian.

The best edition of his complete works is that by Haury (1906, et seq.). The Loeb Library edition (7 vols. 1914, et seq.) has a translation by H. I. Dewing. See Dahn, *Procopius von Caesarea* (1866); Renan, *Essais de Morale*; Bury's Gibbon; Haury, *Procopiana* (1891).

Procrustes (Gr. *Prokrotystēs*; from *prokrotaînō*, 'to beat out,' 'to stretch out'), the surname of a celebrated robber of Attica, named Demastes, or Polypemon. All who fell into his hands he placed on a bed which was either too long or too short for them, but to which he adjusted them either by racking or by amputation till they died. This he continued to do until Theseus overpowered him, and made him suffer the tortures he had inflicted on others.

Procter, BRYAN WALLER ('Barry Cornwall'), was born in Leeds, 21st November 1787. Educated at Harrow, with Byron and Peel for schoolfellows, he was articled to a solicitor at Calne, about 1807 came to London to live, and in 1815 began to con-

tribute poetry to the *Literary Gazette*. He published four volumes of poems, and produced a tragedy at Covent Garden, whose success was largely due to the acting of Macready and Kemble. He was called to the bar in 1831, from 1832 to 1861 was a metropolitan commissioner of lunacy, and died 4th October 1874.

His works, issued under the pseudonym 'Barry Cornwall' (a faulty anagram of his real name), comprise *Dramatic Scenes* (1819), *A Sicilian Story* and *Marcian Columna* (1820), *The Flood of Thessaly* (1823), and *English Songs* (1832), besides memoirs of Kean (1835) and Charles Lamb (1866). The last is always worth reading; but his poems may be safely neglected. Yet 'Barry Cornwall' will be remembered as the man whom every one loved—that every one including a hundred of the greatest of the century: Lamb, Wordsworth, Coleridge, Leigh Hunt, Keats, Landor, Scott, Tennyson, Browning, Matthew Arnold, Swinburne, Hazlitt, Macaulay, Carlyle, Dickens, and Thackeray were only a few of his numberless friends and acquaintances.

See *Bryan Waller Procter: an Autobiographical Fragment* (1877), edited by Coventry Patmore; Gosse in *Ward's English Poets*.

ADELAIDE ANNE PROCTER, Barry Cornwall's daughter, was born in London, 30th October 1825, and died there 3d February 1864, having in 1851 become a Roman Catholic. By her *Legends and Lyrics* (1858-60), first written some of them for *Household Words*, she made her name known.

Proctor, or **PROCURATOR**, one who acts for another. This name was formerly given to a class of practitioners in the English Admiralty and ecclesiastical courts; but proctors are now merged for almost all purposes in the general body of solicitors. The King's Proctor is an officer (now the Solicitor to the Treasury) who intervenes to oppose a petition for divorce if he has reason to suspect fraud or collusion. The clergy appoint proctors to represent them in the convocation of their province.

In each of the universities of Oxford and Cambridge there are two proctors, whose duties are to preserve the peace of the university, to repress disorders among the students, and inflict summary academical punishment. They have the command of the academical constabulary, and have also an extensive police jurisdiction in the town. They patrol the streets after dark, attended by officers popularly known as 'bull-dogs.' The proctors must be Masters of Arts, and are chosen by the colleges according to a certain rotation. They nominate two pro-proctors to be their deputies and assistants. The summary authority of the proctors extends both to undergraduates and Bachelors of Arts. They vote in the election of some of the professors and other officers. At Durham also there are two proctors, who, however, do not personally patrol the streets, and have command over only the university police.

Proctor, RICHARD ANTHONY, astronomer and popular author, was born at Chelsea in March 1834. He was educated first at King's College, London, and then at St John's, Cambridge, where he devoted himself chiefly to athletics. His first literary venture was, in 1865, an article on 'Double Stars' in the *Cornhill Magazine*, and from that time he gave himself to astronomy. In 1866 he was elected an F.R.A.S., and in 1872 its honorary secretary, but he retired in 1873 to make a lecturing tour in America. About this time he communicated to the R.A.S. some important papers on 'The Construction of the Milky Way,' 'The Transit of Venus,' 'Star Distribution,' &c. and his name is associated with the accurate determination of the rotation of the planet Mars,

and with the theory of the solar corona. One of his undertakings was the charting of the 324,198 stars contained in Argelander's great catalogue. His science magazine *Knowledge* was founded as a weekly in 1881, and became a monthly in 1885. He settled in Florida, and died at New York, 12th September 1888. A man of untiring energy, and author of fifty-seven books, he found time to cultivate music, and was a great chess and whist player. His most important work was in connection with stellar distribution.

Procurator-fiscal, a legal officer in Scotland at whose instance criminal proceedings are taken in the local and inferior courts. He is appointed by the Lord Advocate, and is not removable from office except by the Secretary for Scotland for inability or misbehaviour, on a report by the Lord President and the Lord Justice-clerk (7 Edw. VII. chap. 51, secs. 22, 23). His business is to take the initiative in the prosecution of crimes. There being no coroner's inquest in Scotland, he does the work which that functionary does in England by way of inquiry into the cause of deaths occurring under circumstances of suspicion. Whenever he has reason to believe a crime has been committed, his duty is to apply for a warrant to arrest the alleged criminal, to summon and preconvince witnesses, and to bring the case to trial. A private person can only prosecute in the inferior criminal courts in Scotland by obtaining the concurrence of the procurator-fiscal. Such concurrence is as a general rule granted as a matter of course. Private prosecution is now practically unknown except in summary cases. When the procurator-fiscal takes the preconvictions of the witnesses, he sends a copy of them to the crown agent, who submits them to the crown counsel, of whom the Lord Advocate is the chief; and, if these counsel think the evidence is strong enough, the prosecution is proceeded with to trial. See CRIMINAL LAW.

Procyon. See RACCOON.

Producer Gas. See GAS (HEATING, &c.).

Professional. See AMATEUR.

Professor, an officer in a university, college, or other seminary, whose duty it is to instruct students, or read lectures on particular branches of learning. In the early times of universities the degrees conferred on students were licenses to act as public teachers; and the terms Master, Doctor, and Professor were nearly identical in signification. As, however, the body of graduates ceased in the course of time to have any concern in public teaching, a separate class of recognised teachers sprang up, paid sometimes with salaries, in other instances by fees from their hearers. These were called professors; and in the German and Scottish universities they became the governing body, and sole recognised functionaries for the purpose of education. In the universities in which collegiate foundations prevailed, as Oxford and Cambridge, they became, on the other hand, only secondaries or auxiliaries, attendance on their lectures not being generally deemed indispensable, and the necessary business of instruction being carried on by the functionaries of the several colleges. Nowadays a professor is expected to divide his time between teaching and research; some, indeed, are untrammelled by teaching duties. See UNIVERSITY; the articles on the several universities; and ROYAL SOCIETY.

Profit-sharing was defined in a Board of Trade report on Profit-sharing in 1912 as involving 'an agreement between an employer and his workpeople under which the latter receive, in addition to their wages, a share, fixed beforehand, in the profits of the undertaking.' It is held by those in favour of the system that profit-sharing, by giving

employees an interest in the welfare of the establishment, advances its prosperity by increasing the quantity and improving the quality of its product, by promoting greater care of implements and economy of material, and by lessening the antagonism generally between capital and labour; to these motives is frequently added that of altruism on the part of an employer towards his employees. The promotion of profit-sharing schemes has been almost wholly the work of employers, while Trade Unions have generally opposed them as threatening the solidarity of their movement, and as tending to depress wages. The name has been extended to include a great variety of schemes by which the additional fund due to the workman may be paid to him directly in cash, or put to his credit as an inducement to thrift, or as a deferred benefit for sickness, old age, &c., or it may be allotted to him in whole or in part in the form of shares in the company. This last, the method of co-partnership, has become of increasing importance in the practice of sharing profits. A sliding scale relating wages to profits has been adopted by some industries, while others grant various types of bonuses. Bonuses, however, are outwith the definition of profit-sharing given above. Profit-sharing as distinguished from co-operation has been tried in concerns as various as gas undertakings, iron-foundries, paper, cotton, and woollen factories, the painters' and decorators' trade, millinery businesses, and all sorts of retail shops.

Turgot in 1775 recognised a principle of profit-sharing, but Edme-Jean Leclaire (q.v.), a successful Parisian painter and decorator, was the first to carry it to a practical issue. Leclaire by wonderful energy and capacity had risen to the front rank in his trade, and become a large employer of labour. For the benefit of his workmen in cases of illness he had established a mutual aid society in 1838, and he read everything he could lay his hands upon which tended to help him to improve the social condition of his workmen. M. Fiérier in 1835 suggested that the participation of the workmen in the profits of the master would promote harmony between capital and labour. In June 1840 Leclaire introduced some preliminary changes, and in January 1842 he announced his scheme of profit-sharing. The men were sceptical as to Leclaire's intentions, until in February 1843 an object-lesson in the shape of a bag containing some 12,000 francs—their share of the year's profits—was thrown on a table before them. In 1869 the firm received legal status as the *Maison Leclaire*, with the arrangement that the net profits of the business should be divided in a certain fixed proportion between the managing partners, mutual aid society, and the regular workmen. Since 1870 every workman has been entitled to a share of the profits proportionate to his wages. After Leclaire's death in 1872 the system was maintained in the business, now known as Brigniot, Cros, et Cie. Some critics have attributed its success to the energy of Leclaire rather than to any intrinsic merit of the scheme, but its object has been achieved in that it has made management an affair of permanence and the workmen sober, thrifty, and industrious. The Co-operative Paper Works, Angoulême, founded by M. Laroche-Joubert, adopted a system of profit-sharing in 1843, quite independently of Leclaire, provision being made for the admission of workmen shareholders.

One of the most interesting lessons in co-partnership has been afforded by the *Familleuse* of Messrs Godin (now Colin et Cie) of Guise. In this iron-foundry the workmen's share of profits accumulates towards the purchase of shares in the firm. The *Bon Marché* retail store in Paris also has a long-standing scheme of co-partnership in operation.

In Great Britain many systems of profit-sharing have been tried, some indeed as far back as 1829. The one adopted at the Whitwood Collieries of Messrs Briggs, Yorkshire, lasted beneficially from 1864 to 1875, when it ceased on account of the participation of the workmen in a strike against reduction of wages. In 1889 the South Metropolitan Gas Company, under Sir George Livesey, began to share profits with its employees, using a sliding scale to make the dividend on shares and on wages vary inversely with the price of gas. Later the employees were enabled also to acquire shares in the business. Some 40 gas companies in England have adopted some system of co-partnership. Messrs J. T. and J. Taylor, woollen cloth manufacturers, Batley, instituted in 1896 a scheme by which employees receive a proportion of profits in the form of company shares, the dividends being paid in cash. These shares, however, carry no voting power, though they now represent more than half the capital of the business. An interesting scheme of profit-sharing is that started in 1909 by Lever Bros., soap manufacturers, Port Sunlight, with the object of promoting more economical working among their employees. The latter receive annually, according to the value of their services, a number of 'partnership certificates,' which do not represent real capital, but merely entitle the holders to an annual dividend. The dividend, however, is paid in the form of cumulative preferred ordinary shares representing real capital, and conferring voting rights. Partnership certificates are subject to forfeit, but in cases of retirement, &c., are exchanged for similar holdings in preferential certificates. The system is not pure co-partnership: it has been called 'prosperity-sharing.' Further variations are presented by the firms of Armstrong, Whitworth, & Co., Clarke, Nickolls, & Coombs, Rowntree & Co.; and the movement has spread since the Great War, especially in larger concerns.

Profit-sharing enterprises are numerous in the United States. Two of the most successful examples are the Procter & Gamble Company, of Ivorydale, Ohio, and the N.O. Nelson Manufacturing Company, of St Louis, Mo. In the former, employees are enabled to buy common stock at specially favourable terms. The United States Steel Corporation started a somewhat similar plan in 1903. The N.O. Nelson Company, brass manufacturers, began a system of profit-sharing in 1886, first in cash, then in shares, and in 1905 consumers were also admitted to a dividend. The principles have been applied also in Germany, Holland, Italy, Switzerland, &c.

The merits of profit-sharing as a factor in industrial remuneration have been variously judged. Of the 380 schemes started in Great Britain by 1920, 198 had been abandoned. Much depends on the type of industry involved—gas companies have been specially successful. In industries liable to violent fluctuations, profit-sharing schemes usually succumb to the discontent of employees in years when there are no profits to share. Experience has also showed that cash profit-sharing is not so likely to succeed as a scheme of co-partnership which gives the employee a live interest in the welfare of the business.

See Hux's *Maison Leclaire* (1883); Taylor's *Profit-sharing* (1884); Bohmert's *Participations aux Bénéfices* (1888); Gilman's *Profit-sharing between Employer and Employee* (1900); Bushill's *Profit-sharing and the Labour Question* (1891); Schloss, *Methods of Industrial Remuneration* (3d ed. 1917); T. Burt, M.P., *Twenty Years of Co-operation at Guise* (1904); C. Gide, *L'Actionnariat Ouvrier* (1910); Board of Trade's *Report on Profit-sharing and Labour Co-partnership* (1912); C. R. Fay, *Co-partnership in Industry* (1913); A. Williams, Co-

partnership and Profit-sharing (1913); L. L. Price, *Co-operation and Co-partnership* (1914); A. W. Barnett, H. S. Dennison, &c., *Profit-sharing: Its Principles and Practice* (1918), giving the American aspect of the subject; H.M.S.O. *Report on Profit-sharing and Labour Co-partnership in the United Kingdom* (1920), with a very full bibliography; J. A. Howie, *Sharing Profits with Employees* (2d ed. 1923); and the articles CO-OPERATION, SOCIALISM.

Prognostications. See ALMANAC; METEOROLOGY; STORMS; WIND.

Programme Music, a term applied to music written on a pictorial or literary basis, which, however, must preserve its musical significance. The listener must be able to take pleasure in it *qua* music, though his enjoyment would be considerably enhanced by a knowledge of the picture or story which the composer had in mind. Direct imitation of natural phenomena has little artistic value, but suggestion in music of situations external to music can be done, frequently with singularly happy results. Programme music is no new creation. Many of the pieces in the Fitzwilliam Virginal Book (Elizabethan), Kuhnau's *Bible Sonatas* (1700), some of Rameau's works for the harpsichord, including *La Foulle* and Bach's *Capriccio on the Departure of a Brother* are frankly descriptive. Beethoven described his *Pastoral* symphony as 'rather the expression of feeling than of painting,' but his piano sonata *Les Adieux, l'Absence et le Retour* has really but the slightest of outside associations. In the 19th century the enormous advance in orchestral technique and the much closer association of poetry and music gave a great stimulus to programme music, which now proceeded along two separate lines. Schumann with his *Carnaval* and Debussy with his *Préludes* added fantastic tints, indicating merely a certain mood or line of thought. Berlioz (though not always very consistently), Liszt, and later Strauss and some of the modern Russian school, on the other hand, turned their attention to symphonic poems, dealing with a definite episode or story. The *leit motif* of the Wagnerian drama and passages such as the Rhine-music and the fire-music from the *Ring* are nothing but excursions into the domain of programme music. From a logical point of view, programme music can be considered as merely particularising an abstract sentiment or emotion. Instead of writing a serenade of a general type, Ravel chooses that of a Spanish court jester (*Alborado del Gracioso*), and an emotional conflict, instead of being expressed on this occasion in a symphony, is illustrated by Tchaikowsky from Dante's episode of *Francesca da Rimini*. See MUSIC.

Progreso, the port of Mérida, in Yucatán, from which it is 25 miles N. by rail. It stands on an exposed, open bay, and is one of the worst harbours in the world; but it has a large trade, exporting much henequen or sisal. Pop. 5000.

Progression, in Arithmetic, is the succession, according to some fixed law, of one number after another. A series of numbers so succeeding one another is said to be 'in progression.' Progression may be of various kinds, but the three forms of most frequent occurrence are *Arithmetical Progression* (q.v.), *Geometrical Progression* (q.v.), and *Harmonical Progression*. If the terms of an arithmetical progression be inverted they form a series in harmonical progression; thus, 1, 2, 3, 4, 5, 6, &c. is an arithmetical progression; and 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, &c. is a harmonical progression. This series is principally important in connection with the theory of music, in determining the length of the strings of instruments. See HARMONICS.

Progression, MUSICAL. The regular succession of chords or the movement of the parts of a

musical composition in harmony, where the key continues unchanged, is called Progression; where a new key is introduced it is not progression, but Modulation (q.v.).

Prohibition. See LIQUOR LAWS, and TEMPERANCE.

Projectile is the name given to any mass thrown so as to describe a path in air near the earth's surface. The path described is called the trajectory. The importance of the subject springs from its close connection with Gunnery (q.v.). Any mass projected into the air is under the action of two forces: first, its weight, acting downwards and practically constant; second, the resistance of the air to motion through it, which resistance is a function of the speed, and depends also on the form, size, and mass of the projectile.

If we consider the action of gravity alone, the problem is a very simple one. Since the force

Fig. 1.

of gravity is always vertical, there can be no change in the value of the horizontal component of the velocity. The projectile, projected from any point O (see fig. 1) at any inclination, will some time or other reach the highest point A. At this point the vertical velocity will be zero; and, if the horizontal velocity were here suddenly reversed, the projectile would travel back along the same trajectory to O. As it is, the projectile proceeds along the path AO', which must be exactly similar to AO. In short, the trajectory is symmetrical about the vertical line drawn through the highest point A. Reckoning from A, let us suppose the projectile to reach P' after t seconds. Then, if the horizontal velocity is v , the distance of P' from the vertical line AB—P'M namely—is measured by the product vt . But the projectile in falling through the height AM has acquired a vertical velocity gt , where g is the acceleration due to gravity. Thus the space fallen through, being measured by the product of the average speed and the time, is

$$AM = \frac{1}{2}gt^2 = \frac{1}{2}gMP'^2/v^2 = \frac{1}{2}gMP'^2/v^2.$$

The trajectory is therefore a Parabola (q.v.) with its axis vertical.

If we suppose the projectile to be projected with a velocity whose vertical and horizontal components are respectively u and v , then the angle of projection has its trigonometrical tangent equal to u/v . The time taken to reach the highest point is u/g , and the total range on the horizontal plane is

$$OO' = 2.OB = 2vu/g.$$

If we interchange v and u so that the tangent of the angle of projection becomes v/u , instead of u/v , we get still the same range. Generally, then, a given point, O', can be reached by two trajectories with the same initial speed of projection. It is easy to show that the two corresponding directions of projection are equally inclined to the line that makes 45° with the horizontal; and the range is greater according as the components u and v of the given initial velocity are less unequal in magnitude. The greatest range is attained when $u = v = V/\sqrt{2}$, V being the total velocity of projection—i.e. when the angle of projection is 45°. In this case the range is V^2/g . Thus, to throw a ball to a distance of 100 yards or 300 feet it is

necessary to project it with a velocity of at least 100 feet per second (nearly). Practically, however, because of the atmospheric resistance, it would need a distinctly greater speed of projection than that just given to attain the desired range.

A very simple observation suffices to show that the parabolic trajectory is only approximately realised in air. A well-driven cricket or golf ball will be seen to a spectator suitably placed to describe a trajectory which is distinctly asymmetrical about a vertical line through the highest point. The path will be found to be less curved during the ascent than during the descent; while the highest point is considerably nearer the end than the beginning of the trajectory. In fig. 2 the general character of a real trajectory, AB' , is compared

Fig. 2.

with the parabolic trajectory, AB , which would have been described if the air had offered no resistance. AT shows the direction of the initial projection. The same features causing deviation from the parabolic form are still more characteristic of the long flat trajectories of cannon-balls. These, projected with very high speeds, have their approximately horizontal velocities rapidly cut down in the earlier stages by the resistance of the air.

The first approximately accurate ideas of the resistance presented by the air to bodies moving through it at high speeds were obtained by Robins (see GUNPOWDER, GUNNERY, CHRONOGRAPH). Bashforth, by means of his electric chronograph, elaborately investigated the subject. His results indicated that up to velocities of from 800 to 900 feet per second Newton's theoretic law that the resistance varies as the square of the speed holds practically true. The same law (but with a different coefficient) holds for all measured velocities above 1300 feet per second; but between the limits named the resistance depends on higher powers of the speed. Between the velocities of 1000 and 1100 feet per second the velocity of sound in air, in fact—the resistance grows very rapidly, varying for a certain interval as the sixth power of the velocity. The resistance also depends on the form of the projectile, a spherical shot being nearly twice as much resisted as an ogival-headed shot of the same diameter and weight. For different sized projectiles of the same form the retardation due to the resistance is directly as the square of the diameter and inversely as the weight. It is usual to express the diameter in inches and the weight in pounds; and the following numbers are for an ogival-headed projectile, whose weight in pounds equals the square of its diameter in inches. The first line gives the velocity and the second the corresponding resistance-acceleration (negative):

Velocity	1500	1200	1100	1000	900	800	400
Acceleration	218	188	143	79	54	39	10

For a sphere of same weight and size, the resistance-acceleration for speeds lower than 850 feet per second is given by the formula $1.183 \times 10^{-6} v^6$, where v is the velocity. From this it may be shown that such a sphere falling in air can never attain a velocity of 522 feet per second. If projected downwards with a greater velocity it will be retarded, since the resistance due to the atmosphere

is greater than the weight of the body. If projected upwards with a speed of 800 feet per second it will reach a height of only 5112 feet instead of nearly 10,000, and will return to earth again with a velocity of 351 feet. These results show why a meteoric stone never reaches the earth's surface with a velocity of more than a few hundred feet per second. It matters not with what relative speed the meteor may meet the earth. Once it gets into the atmosphere its kinetic energy is rapidly dissipated in heat, and much of its substance volatilised at the high temperature that results. Our atmosphere, in fact, acts as a practically perfect shield to meteoric bombardment.

For projectiles discharged from firearms, see the articles on Bullet, Cannon, Cartridge, Firearms, Gun, Rifle, Shell, Shot.

Projection is the representation on any surface of objects or figures as they appear to the eye of an observer. It thus includes Perspective (*q.v.*), and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection and the place of the light the position of the eye. The theory of projections is of great importance, both in mathematics and geography, being, in the former case, perfectly general in its application, while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, depending upon the position and distance of the eye from the sphere, and the form of the surface on which the projection is thrown; thus we have the *orthographic*, *stereographic*, *globular*, *conical*, and *cylindrical* or *Alcator's* projections, all of which are treated under the article MAP. Another projection frequently employed is the *gnomonic*. In the gnomonic projection the eye is supposed to be situated at the centre of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the *principal point*). It is evident that a map constructed on the gnomonic projection is sensibly correct only for a circular area whose circumference is at a small angular distance from the principal point. From the position of the eye in the gnomonic projection (which is not suited for representing large portions of the earth's surface) it follows that all great circles or portions of great circles of the sphere are represented by straight lines, for their planes pass through the eye. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or Dial (*q.v.*). The gnomonic and stereographic projection of crystals is described and illustrated at CRYSTALLOGRAPHY.

Prolapsus Ani is a common affection of the termination of the intestinal canal, and consists in an eversion of the lower portion of the rectum, and its protrusion through the anus. It may depend on a naturally relaxed condition of the parts, as in infancy, or may be caused by violent straining in cases of costiveness, piles, &c. Whenever it occurs the parts should be washed, and if possible replaced by careful pressure with the hand; and if they do not easily return the forefinger should be oiled and pushed up into the anus, and it will convey the protruded intestine with it, after which the patient should retain the recumbent position for some hours. If it cannot be returned by the above means surgical assistance should be at once sought. In order to remove the tendency to prolapsus the patient should regulate his bowels so as to avoid costiveness, should sponge the parts after every evacuation with cold water or soap and water, and if necessary use astringent injections, as, for example, a weak solution of sulphate of iron, 1 grain to the ounce. In young children the pro-

of straining, and therefore the tendency to the occurrence of the protrusion, may be much diminished by preventing their feet from resting on the ground during defecation. The tendency of the bowel to prolapse may also be diminished by adoption of the following plan—viz. that when the stools are passed the skin near the anus should be drawn to one side with the hand so as to tighten the orifice. In children the occurrence of prolapse gradually lessens, and usually disappears entirely as the child increases in size and in strength. If after the adoption of these means the bowel continues to descend certain surgical means must be resorted to, the usual procedure consisting in the removal of a ring from the prolapsing mucous membrane.

Prolapsus Uteri. See WOMEN.

Proletariat, a term used to denote the lowest and poorest classes of the community. It is derived, through the French, from the Latin *proletarii*, the name given in the census of Servius Tullius to the lowest of the centuries, who were so called to indicate that they were valuable to the state only as rearers of offspring (*proles*). The word has come much into use in the literature of Socialism (q.v.); see also MARX, DICTATOR.

Prologue, a preface or introduction to a discourse or poem, as the *prologue* to Chaucer's *Canterbury Tales*; but more especially the discourse or poem spoken before a dramatic performance, corresponding to the Epilogue (q.v.) at its close. This usually stands outside the action of the piece, an external adjunct to it, being, indeed, a mere address to the public occasioned by the play. The introduction proper, again, belongs to the action itself, and this we find provided for in the prologue of Euripides, spoken by one of the characters, in narrative form, half within and half without the action; in the separate *induction* of many old English plays; and in the preludes and prologues of modern dramas like *Faust*.

Prometheus, a great culture-hero of Greek mythology, the son of the Titan Iapetus and of Clymene, brother of Atlas, Menetius, and Epimetheus. Hesiod tells his history as follows: Once, under the reign of Zeus, when men and gods were disputing with one another at Mecone as to which portions of the victims at sacrifices were to be given to the gods, Prometheus, to outwit Zeus cut up an ox, and placed on one side the best parts covered with oil, on the other the bones covered with fat. Zeus was asked to choose, but, finding the deceit practised upon him, avenged himself on the mortals by withholding from them the fire necessary for the cooking of the meat; whereupon Prometheus stole it in a hollow fennel-stalk, and brought it to them. Zeus next caused Hephaestus to mould a virgin of wondrous beauty, Pandora (q.v.), whom Epimetheus was unwise enough to receive as a present from Hermes, and thus brought through her all imaginable ills upon humanity. Prometheus himself was chained to a rock, and an eagle sent to tear his liver by day, while Zeus caused it to grow anew during the night. At length Heracles killed the eagle, and by the permission of Zeus delivered the suffering Prometheus. Thus far Hesiod's legend. In the splendid tragedy of Aeschylus, the *Prometheus Vinctus*, Prometheus is an immortal god, a friend of the human race, who does not shrink from opposing the evil designs of Zeus against mankind, and even from sacrificing himself for their salvation. He is the long-suffering hero, who, although overcome by Zeus's superior might, yet does not bend his mind. He takes from man the evil gift of foreseeing the future, but gives him the two infinitely superior gifts of hope and of fire; and he is the inventor of architecture, astronomy, writing,

figures, medicine, navigation, the mystery of prophecy, the arts of metal-working, and all other arts which embellish and adorn life. For these boons conferred on the human race he is by Zeus's order chained to a rock in Scythia by Hephaestus, who fulfils this task reluctantly. Here he is visited by the Oceanides, by Io, and by Hermes, who endeavours to find out that which Prometheus alone knows, who will be the son of Zeus and his successor. Refusing to divulge this secret, he is struck by Zeus's lightning and hurled into Tartarus, whence he only re-issues after a time to undergo new sufferings. He is now fastened to Mount Caucasus, and the eagle, an offspring of Earth and Tartarus, comes to torment him daily. Cheiron the Centaur at last offers himself to supply the place of Prometheus in Hades—for on no other condition was he to be liberated than that some other immortal should offer himself in his stead. Cheiron, incurably wounded by Heracles, is accepted by Zeus. Other legends make Prometheus the creator of man out of earth and water. There can be no doubt that Prometheus is a culture-hero, analogous to the Maori *Mani*, and the Finnish *Wainamoinen*. The possession of fire to early man was a matter of enormous importance, and the legend of its being originally stolen from heaven by a primeval hero is very widely spread over the world. The Greek name means 'fore-sight'; Epimetheus ('after-thought') is obviously its opposite. See FIRE.

Promise. See CONTRACT, MARRIAGE.

Promissory-note, a written promise by one person (the maker) to pay another (the payee) or bearer a sum of money either on demand or on a future day. It is in the following form:

£100. LONDON, 1st January 19—.
Three months after date I promise to pay to Mr William Smith or order One Hundred Pounds for value received.
JOHN BROWN.

With certain necessary exceptions, such as the rules regarding acceptance, the law of Bills of Exchange (q.v.) applies equally to notes.

Promotion in the commissioned ranks of the British army, since the abolition of the purchase system in 1871, is obtained by seniority to fill a vacancy, by selection or by brevet for distinguished services. Regimental promotions from second-lieutenant to lieutenant, captain, major, and lieutenant-colonel usually follow on seniority, provided that the necessary examinations have been passed. The rank of Colonel (q.v.) stands on a separate footing, but succeeding steps of major-general, lieutenant-general, and general are made on selection; the seniors, however, have the preference if otherwise eligible, and not above the age limits, which are fifty-five, sixty-two, and sixty-seven respectively. Field-marshal is selected from the generals, with the approval of the sovereign, for special distinguished service. Brevet (q.v.) promotion does not apply when the recipient is serving with his regiment. Non-commissioned officers are sometimes promoted; and quartermasters, music-directors, and riding-masters receive honorary commissions.

Promotion in the navy is governed partly by seniority and partly by selection. On a midshipman passing all his examinations for the rank of lieutenant, he receives his commission as sub-lieutenant, and is then advanced to lieutenant, except in a few special cases, by seniority. Advancement from the lieutenants' to the commanders' list may be said to be by pure selection. There is an intermediate rank of lieutenant-commander from which the selection is made, but these promotions are generally to be found among

officers who have ten to fifteen years' seniority in these two ranks with a proportionate amount of good service. Promotion from the commanders' list to the captains' is also by selection. The rank of Commodore (q.v.) is a temporary one. Captains, rear-admirals, vice-admirals, and admirals are promoted on their respective lists by seniority, but admirals of the fleet are specially selected with the approval of the sovereign.

See articles on the different ranks, ADMIRAL, GENERAL, &c.; also COMMISSIONS (ARMY), RANK, NAVY, MILITARY SCHOOLS.

Promptorium Parvulorum was an English-Latin dictionary, compiled about 1440 by Geoffrey the grammarian, a friar-preacher at Lynn in Norfolk.

Prong-horn. See ANTELOPE, HORN.

Proof. See EVIDENCE; also ENGRAVING.

Proofs, CORRECTION OF. The corrections to be made on a 'proof' of printed matter are marked on the margin; and for this purpose an established set of signs or shorthand is used. The following specimen of a proof exhibits the application of most of these signs:

'To rule the nations with imperial sw¹fy, to impose terms of peace, to spare the humbled, and to reush the ²pre³ed, resigning itto others to describe the courses of the heavens, and explain the rising stars; this, to use the words of the poet of the Eniad in the apostrophe of Anchises to Fabius in the Shades, was regarded as the proper province of a Roman. The genus of the people was ~~more~~ more adverse to the cultivation of the physical sciences than that the European Greeks, and [seen] we have! that the latter left experimental philosophy chiefly in the hands of the ~~A~~frican and African colonists. The elegant literature and metaphysical speculations of Athens, her histories, ⁴tramas, ⁵epics, and orations, had a numerous host of admirers in Italy, but a ⁶feeling of indiffernce was displayed to the practical science of Alexandria. [This repugnance of the Roman mind at home to mathematics and physics, extending from the Atlantic to the Indian ⁷Ocean, from Northern Britain to the cataracts of the Nile, annihilated in a measure ~~all~~ pure sciences in the conquered districts where they had ~~had~~ been pursued, and prohibited attention to them in the mother country.]

Long, indeed, after the age of Ptolemy, the school in connection with which he flourished, remained in existence; &c.

(1) A wrong letter. After every mark of correction a line / should be drawn, to prevent its being confounded with any other in the same line. (2) A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. (3) A space wanted. This mark is also used when the spacing is insufficient. (4) A space or quadrant sticking up. (5) Alteration of type. One line is drawn under the word for *spaces*, two for *small capitals*, three for *CAPITALS*. (6) Correction or insertion of stops. (7) A word struck out, and afterwards approved of (Lat. *stet*, 'let it stand'). (8) A turned letter. (9) An omission. (10) A letter of a wrong font. (11) A word or letter to be deleted. (12) Alteration of type. (13) A new paragraph. (14) Insertion of a clause. (15) A space to be removed or diminished. (16) A wrong word. (17) When letters or lines do not stand even. (18) Mark for a hyphen. (19) No new paragraph. (20) The manner in which the apostrophe, inverted commas, the star and other references, and superior or 'cock-up' letters and figures are marked.

The immediate object of a 'reader' or corrector of the press is to observe and mark every error and oversight of the compositor, with a view to make the printed sheet a perfect copy of the author's manuscript. This is on the supposition that the manuscript itself is quite correct, which is seldom the case; and therefore the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, &c., and in many cases to the verification of quotations, dates, and proper names. Where extensive alterations, omissions, or additions are likely to be made by writer or editor, it is more convenient to take the proofs on long slips, before division into pages. The making of new paragraphs, or the suppression of those in type, should be avoided as causing trouble and expense.

The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and cyclopedias. The corrector has also to direct his attention to the numbering of the pages; to the arrangement of chapters, paragraphs, and notes; to running titles, &c. It is part of his business to observe the mechanical defects of the work—defective types, turned letters, inequalities of spacing between words, sentences, and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations, and such like. In almost all cases two proofs are taken, and in difficult works, such as those in foreign languages, tables, &c., even more. Lastly follows the revision, in which little more is done than seeing that the compositor has made all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second proof for himself.

The thankless and monotonous business of a corrector or reader is more difficult than the uninitiated would believe. It requires extensive and varied knowledge, accurate acquaintance with the art of typography, and, above all, a peculiar sharpness of eye, which, without losing the sense and connection of the whole, takes in at the same time each separate word and letter. See BOOK, PRINTING.

Propaganda (Lat. *De Propaganda Fide*), the name of a Congregation (q.v.), and also of a College, in Rome, the object of which is to direct and forward the propagation of the Catholic religion, especially among the heathen, although Christian dissenters from the Roman Church are also included in the sphere of its operations. The institution was originated by Pope Gregory XIII. (1572-84); but it was fully organised by Gregory XV., who in 1622 established a special Congregation for the purpose. This his successor, Urban VIII., extended and endowed, annexing a college for the education of missionaries to the several countries. One great feature of that college has been to provide for such work natives of the several countries, who are conveyed to Rome at an early

age for the purpose of being specially educated in all the necessary learning of a missionary. In 1908 Pius X. withdrew from the jurisdiction of the Propaganda Great Britain, Canada, the United States, Holland, and Luxemburg, leaving to it (generally speaking) those countries in which the hierarchy was not established.

Propertius, **SEXTUS** (for the second family-name, **Aurelius**, often given him there is no authority), the most impassioned of the Roman elegiac poets, was a younger contemporary of Tibullus, born about 48 B.C. in Umbria, probably at Asisium (the modern Assisi). Nearly all we know of him is gleaned from his writings, according to which he came of an undistinguished, comparatively poor family, lost his father in boyhood, and had a portion of his patrimony confiscated, after Philippi, by the Triumvirs, to reward their veterans, but retained means enough to proceed to Rome for education, and, having chosen his residence, like Virgil and Mæcenas, on the Esquiline, to make poetry the business of his life. The school then fashionable was the Alexandrian, represented by Callimachus and Philetas, and these he made his models, drawing from them his learned tone and his wealth of mythological colouring. In the political and martial movements of the time he took no part, though his patriotism was pure and strong—witness his exultation over the victory off Actium, his scorn of Cleopatra and her presumptuous ambition to dominate the mistress of the world, above all, his appeal to the Romans to renounce self-indulgence and to return to their neglected legends for the civic virtues and the heroism of ‘the brave days of old.’ Such was his precept; while his practice was the emotional poetic life, in the congenial society of Ovid, Virgil (whose *Æneid* he has nobly eulogised), the epic poet Ponticus, and Julius Bassus. Like them he won the favour of Mæcenas, to whom he dedicated a book of his poems, and even ingratiated himself with Augustus, whose achievements he duly celebrated. But the central figure of his inspiration was his mistress Cynthia, a lady somewhat older than he, whose real name was Hostia. For many years he cherished a glowing passion for this highly gifted and beautiful, but far from virtuous woman, till about 24 B.C. he disentangled himself from her spells. She died before him; but even after death she lived in his memory as she still lives in the poems that have immortalised her. Propertius left Rome, it would appear, only once, on a visit to Athens, when he may have experienced the shipwreck he has so vividly described. The year of his death lies, with probability, been placed about 14 B.C. Of his poems only the first book, devoted entirely to Cynthia, was published during his lifetime; certainly the last of the four was given to the light, in terms of his will, by his friends. Its contents are youthful pieces, in which he celebrates the legends of early Rome in the style of Callimachus, and have a special interest in having most likely inspired Ovid to the composition of his *Fæsti*—perhaps even of his *Heroides*. As a poet Propertius ranks high in Roman literature—the tone of the later criticism (with Goethe at its head) being one of increasing admiration for his native force, his eye for dramatic situation, his power over the reader’s sympathies, giving the effect of reality to what in the hands of Tibullus or even Ovid is merely conventional. He has more in common with Catullus than with either of these, while he lacks the artistic graces peculiar to the three, being often rough to harshness and obscure from defect of finish.

There are texts by Müller (1880), Baehrens (1880), Postgate (1894), Phillimore (1901), Butler (1905), and Rothstein (1924); notes by Paley (1872) and Postgate;

English translations by Cranston (1875), Phillimore (1906), and Butler (1913).

Proportion, in Arithmetic and Geometry, is a particular species of relation subsisting between groups of numbers or quantities. Notwithstanding that the idea of proportion is found to exist in perfection in the mind of every one, yet a good definition of it is a matter of extreme difficulty. The two definitions which, on the whole, are found to be least objectionable are that of Euclid and the ordinary arithmetical definition. ‘The latter states proportion to be the ‘equality of ratios,’ and throws us back on the definition of the term *Ratio*, which may most simply be considered as the relation of two numbers to each other, shown by a division of the one by the other. Thus, the ratio of 12 to 3, expressed by $\frac{12}{3}$, or 4, denotes that 12 contains 3 four times; and the ratio of 8 to 2 being also 4, we have from our definition a statement that the four numbers, 12, 3, 8, and 2, are in proportion, or, as it is commonly expressed, 12 bears to 3 the same ratio that 8 does to 2, or $12:3::8:2$. In the same way it is shown that $3:8::13\frac{1}{2}:36$; for $\frac{3}{8}$ expresses the ratio of the first to the second, and $\frac{13\frac{1}{2}}{36} = \frac{27}{72} = \frac{3}{8}$. It will be

gathered from the two arithmetical proportions here given, and from any others that can be formed, that ‘the product of the first and last terms (the extremes) is equal to the product of the second and third terms (the means);’ and upon this property of proportional numbers directly depends the arithmetical rule called ‘proportion,’ &c. The object of this rule is to find a fourth proportional to three given numbers—i.e. a number to which the third bears the same ratio that the first does to the second; and the number is at once found by multiplying together the second and third terms, and dividing the product by the first. Proportion is illustrated arithmetically by such problems as, ‘If four yards cost six shillings, what will ten cost?’ Here, 15 being the fourth proportional to 4, 6, and 10, fifteen shillings is the answer. The distinction of proportion into *direct* and *inverse* is not only quite unnecessary, but highly mischievous, as it tends to create the idea that it is possible for more than one kind of proportion to subsist. *Continued proportion* indicates a property of every three consecutive or equidistant terms in a ‘Geometrical Progression’ (q.v.)—for instance, in the series 2, 4, 8, 16, 32, . . . , $2:4::4:8::8:16$, &c., or $2:8::8:32$, &c. In the above remarks all consideration of incommensurable quantities has been omitted. The definition given by Euclid is as follows: Four magnitudes are proportional when, any equimultiples whatever being taken of the first and third, and any whatever of the second and fourth, according as the multiple of the first is greater, equal to, or less than that of the second, the multiple of the third is also greater, equal to, or less than that of the fourth; i.e. A, B, C, D are proportionals when, if mA is greater than nB , mC is greater than nD ; if mA is equal to nB , mC is equal to nD ; if mA is less than nB , mC is less than nD ; m and n being any multiples whatsoever. The apparent clumsiness and circum-

location in this definition arise from Euclid's endeavour to include incommensurable quantities; throwing them out of account, it is sufficient to say that four magnitudes are proportional if, like multiples being taken of the first and third, and like of the second and fourth, when the multiple of the first is equal to the multiple of the second, the multiple of the third is equal to the multiple of the fourth. For example, take the numbers 12, 3, 8, and 2; multiply 12 and 3 respectively by such numbers as will give equal products, say by 4 and 16, the product being then 48 in both cases; the products of the remaining numbers, 8 and 2, by these multipliers are equal to one another, being both 32; and therefore these four numbers are proportional.

Prorogation, the continuance of parliament from one session to another. Prorogation not only suspends all business, but quashes all proceedings pending at the time, except impeachments by the Commons and writs of error and appeals before the House of Lords. A bill must be renewed after a prorogation as if it had never been introduced. See PARLIAMENT.

Prosecution. See CRIMINAL LAW.

Prosecutor, he who takes the initiative in bringing a person to trial on a criminal charge. In England a prosecutor may begin by taking steps to have the accused brought before a magistrate; the magistrate may send the accused for trial, or, in certain cases, he may bind the accuser over to prosecute. On a charge of perjury, conspiracy, libel, &c. the prosecutor must proceed before a magistrate, unless a judge or law officer of the crown has given him leave to prefer an indictment. In other cases, a prosecutor may, at his own discretion, begin by preferring an indictment which will come in due course before the Grand Jury (see JURY) at assizes or quarter sessions. The liberty of prosecution thus permitted is a valuable safeguard; the government cannot shield offenders by refusing to prosecute; it must, however, be remembered that the Attorney-general can always stop the trial of a prisoner by entering a *nolle prosequi*. In cases which concern the state it is the duty of the Attorney-general to prefer an indictment or information; in other cases the law was formerly content to leave the parties injured by a crime to commence proceedings at their own expense and risk. Of late years the government has shown a disposition to take upon itself the duty of prosecuting in cases where the public interest is concerned. In 1879 a public prosecutor was appointed. The public prosecutor is the creation of three 'Prosecution of Offences' statutes of 1879, 1884, and 1908. The regulations provide for the public prosecutor taking action in cases of importance or difficulty, or in which special circumstances or the refusal or failure of a person to proceed with a prosecution appears to render the action of the public prosecutor necessary to secure the due prosecution of the offender. Criminal courts have also been empowered to allow costs to prosecutors; and these costs are now paid by the Treasury. In Scotland the Procurator-fiscal (q.v.) makes inquiry in regard to crimes committed within his district; cases are prepared and conducted by the Lord Advocate or by one of his deputies; and prosecutions by private persons are practically unknown. In Northern Ireland prosecutions are usually undertaken by crown solicitors and by counsel acting under the control of the Attorney-general. There are public prosecutors in the United States. See CRIMINAL LAW.

Proselytes (Gr. *pros-elytos*, Heb. *gerim*), an English form of the Greek translation of the name given by the Jews to those heathens who

became converts to Judaism. There were two kinds of proselytes distinguished: 'Proselytes of the Gate,'—i.e. heathen strangers, who, in order to be allowed to reside in Palestine, had undertaken to submit to the 'Seven Commandments of the Sons of Noah,' that prohibit blasphemy, idolatry, murder, incest, theft, disobedience to the authorities, and the eating of flesh with the blood in it: commandments which probably had grown out of certain restrictions originally put upon the 'strangers' by the Mosaic Law (Exodus, xii. 19; xx. 10, &c.). These 'Proselytes of the Gate,' or 'Sojourners,' could not claim all the privileges of an Israelite, could not redeem their first-born, and, at a later period, were not allowed to live in Jerusalem. The second class of proselytes was formed by the *gere hatsadek* ('Pious Proselytes'), or *gere haberith* ('Proselytes of the Covenant'). These accepted all the dogmas and customs of Judaism to their fullest extent, and were called 'Complete Israelites.'

Proserpine (in Latin Proserpina, a form of the Greek Persephone), daughter of Zeus and Demeter (Ceres). The story of her abduction by Pluto, god of the under-world, of her mother's unceasing search for her, and of her living part of the year above and part underground, is detailed under DEMETER. There can be little doubt that the myth is an expression of the revival of nature in spring after the death of winter. Proserpine was usually worshipped under the name of *Koré* ('maiden') along with her mother Demeter. The chief seats of her worship were Sicily and Magna Græcia; but she had also temples at Corinth, Megara, Thebes, and Sparta. The pomegranate is her symbol, and the pigeon and cock are sacred to her. In works of art she bears a cornucopia, or is represented with ears of corn and a cock.

Prosody (Gr. *prosōdia*), that part of grammar which treats of the rules of rhythm in metrical composition. See METRE, RHYME, BLANK VERSE.

Prosper of Aquitaine, the zealous champion of Augustine and Augustinian doctrine against the Semi-Pelagians, was born in Aquitaine about the end of the 4th century, was a prominent theologian in southern Gaul in 428-434, and in the latter year settled in Rome. The date of his death is not known. Besides letters, *Responsiones*, and pamphlets on the doctrines of grace and free-will, he wrote a chronicle, coming down to 455 A.D., a long hexameter poem against the Pelagians, and a *Liber Sententiarum* compiled from Augustine's works. There is an edition of Prosper's works by Le Hirn and Mangeant (Paris, 1711). He is sometimes called St Prosper, the 25th June being his day in the Catholic calendar.

Prossnitz (Czech *Prostějov*), a town of Moravia, 13 miles by rail S.W. of Olmutz, has celebrated corn-markets and manufactories of clothing, linen and cotton stuffs, and distilleries and breweries. Pop. 31,000.

Prostate Gland, a firm body of muscular and glandular structure which surrounds the male urethra immediately below the neck of the bladder. In size and shape it is not unlike a chestnut. It occasionally is the seat of tumours, and of acute inflammation, sometimes leading to abscess; but far the most frequent disorder to which it is subject is a chronic enlargement occurring after middle life, which is the most common cause of retention of urine at that period. See URINE.

Prostitution dates unhappily from the earliest stages of human culture, and was a recognised institution in the times of the Jewish patriarchs (Gen. xxviii. 15). The religious prostitution of women in honour of the goddess of fertility was usual in

ancient Babylonia, and was an integral portion of the worship of Ashtoreth in Phœnicia; and similar

is at Athens, and the Romans had regular brothels. Christian kings issued at various times strenuous laws aiming at the suppression of the vice; some of the earliest examples of this legislation being found amongst the capitularies of Charlemagne. The Crusades gave a great impetus to un concealed immorality; and in the middle ages it may be said that prostitution was recognised as a necessary and inevitable part of the social organism. In the Thirty Years' War swarms of women followed the armies of both sides. Modern states vary much in their attitude to this vice, either disregarding it, regulating it by specific ordinances, or trying to check it. In Japan (q.v.) prostitution may even be regarded as an honourable self-devotion.

In the language of English law, a prostitute is a woman who carries on a course of habitual and promiscuous immorality. Acts of immorality are not always criminal; but in England a brothel or disorderly house is a nuisance, and a person who keeps such a house may be indicted and punished by fine and imprisonment; if two ratepayers make a complaint to the police the local authorities undertake the prosecution, and the expenses are paid out of the rates. The landlord of a house is also liable to penalties if it is used with his knowledge as a brothel. Special penalties are imposed on brothel-keepers harbouring thieves, and on publicans who permit prostitutes to assemble on their premises. The Criminal Law Amendment Act, 1885, deals with the offence of procuring any woman or girl to have unlawful connection with any person, or to become an inmate of a brothel at home or abroad, and with the offence of using threats, or false representations, or drugs for the same unlawful purpose. A search-warrant may be granted under the act in case there is reason to suspect that a woman or girl is detained as an inmate of a brothel. No punishment is inflicted on the men who frequent a brothel; not because the guilt of sexual vice is less in a man than in a woman, but because immoral women form a definite class of the community and immoral men do not. In the law of contract prostitution is regarded as a worthless or as an illegal consideration, according to circumstances. Thus, a bond providing for future illicit cohabitation is void, as being founded on an illegal consideration; a promise to pay money for past cohabitation is founded on no consideration at all, and is binding if made under seal. A person who lets lodgings or supplies dresses, &c. to a woman for the purpose of enabling her to live as a prostitute cannot recover the rent of the premises or the price of the goods sold. In some continental countries the law extends a certain toleration to brothels, and deals with prostitutes for the purpose of preventing the spread of venereal disease. By the Contagious Diseases Acts, 1864-68, a system of inspection was established in certain military and naval stations in England and Ireland; magistrates were empowered to order the examination and detention in hospital of women suffering from contagious diseases. As to the medical and moral results of the acts, there is an extraordinary conflict of evidence. A resolution condemning the whole system of examination was adopted by the House of Commons in 1883, on the motion of Mr Stansfeld; the acts have been repealed; and in India the same system was in 1897 abolished by the governor-general in council.

See CONTAGIOUS DISEASES ACTS, WOMEN'S RIGHTS.

Protagoras (c. 485-c. 411), the earliest of the Greek sophists, was a native of Abdera, who at

Athens and in Sicily taught a system of practical wisdom, specially fitted to train men for the duties of citizen in a Greek state. The basis of his doctrine was the proposition that 'man is the measure of all things.' See SOPHISTS.

Proteaceæ, a family of evergreen dicotyledons, containing about 1000 known species of shrubs and small trees, chiefly natives of South Africa and of Australia, and forming a remarkable feature of the vegetation of these regions. Some of them, as species of *Protea* and *Banksia* (q.v.),

houses. The timber of some of the larger species is used for various purposes.

Protection. The causes which have made for changes of fiscal policy in this country have never been simple, self-consistent, or necessarily prolonged over more than a short period of years. Adam Smith's work was directed not against the landed interest at all, but against the manufacturer and merchants who relied on the commercial system, and his political opponents were, in consequence, the Whigs as Protectionists, and not the Tories as comparative Free Traders. Yet his policy came to full flower by the joint combination of Whigs and Conservatives, founded on an agitation conducted by the manufacturing class against the interests of the Tory landed gentry. It is as well, then, to review the progress of the fiscal controversy at intervals, and to observe that the modification of position, or even the joint action of sections of opinion which vary slightly among themselves, does not necessarily imply that the fall of an older system is not imminent. When Mr Chamberlain brought the tariff issue once more into the political arena, he found the country eager to discuss it, and singularly unprovided with the general arguments and statistical information required for the purpose. Cobdenism, indeed, was possessed of a large if somewhat antiquated armament, and was able to furnish up with some rapidly the rusty weapons of its political forebears. Its opponents, on the other hand, had the political disadvantage, if the philosophic merit, of having to consider the whole problem as one entirely new. The Fair Trade controversy of the early 'eighties had had but a trifling effect on modern Conservative thought, and, beyond that, the struggles of 1846 had from the 20th-century standpoint little more than historical interest. To the progressive forces in the tariff controversy the industrial world had been made anew since the split between Peel and Disraeli. The Free Traders alone seemed satisfied with the reiteration of the old arguments. Under the circumstances, it is not surprising that it took no inconsiderable space of time to imprint on the minds of the new Tariff Reformers the fundamental doctrines which underlie the system of scientific Protection as practised in Europe and America to-day, and as carried out in England both in the comparatively recent and in the more remote past. In addition, such economic training as is given in our universities has for more than a generation been entirely directed to proving that the teachings of the orthodox school of English and French economists are not only valid but almost inspired. As a consequence, the ordinary public man in England remained practically ignorant of the works of List, of the views of the great historical school which had prevailed in Germany for half a century of the new Viennese critical method of which Vienna was the centre, and of the success with which English and Italian professors had applied mathematical formulæ to economic problems. The effect of these competing influences was to give to the earliest contentions of the Tariff Reform movement an element of crudity which has now been removed by a prolonged course

of controversy and study. This particular immaturity of thought would appear now to remain the possession of Free Traders, who were older in the school, and therefore less ready to apply modern experience to the existing facts of national production and international exchange.

But before we proceed to any historical analysis it may be as well to give an outline of the two competing theories which it is proposed to test by the experience of the past. The advantage of the Free Trade system, whether from the point of view of explaining it or from the point of view of attacking it, is its extreme simplicity. As with all views which claim to be permanent and universal truths, adhesion to it does not compel the believer to possess any special knowledge either of current facts or of past events, for the doctrine once based on a system of *a priori* reasoning obviously stands beyond the outside criticism of fact. From the Free Trader's standpoint it must be destroyed by an alternative theory. On the other hand, like all other universal doctrines, Free Trade at once rouses antagonists who observe some real or apparent contradiction between the general theory and the practical results which it produces. When the objectors have formulated a hostile theory of their own upon their observation of fact, the battle between the two schools is fairly joined. Indeed, on the whole, the distinction is well maintained. The historical school have arrived at their conclusions by a study of the economic development of nations, and have based their Protectionist theories on inductions from the facts they have observed. The deductive school of economists, on the other hand, have, with certain notable exceptions, deduced their Free Trade theory from certain *a priori* and far more general conceptions of the nature of man and the development of human society.

Nothing, indeed, could be wider than the general series of propositions which underlie the Free Trade concept. In the first place, universal Free Trade would, by the universal flow and division of industry, lead to the fullest possible development of the total resources of the world. In the second place, such a process would be to the best advantage under any and every circumstance of the individual nations which go to make up the sum total of commerce and industry. In the third place, just as there is conceived to be no conflict between the maximum development of the world's resources and the interest of any particular nation claiming a share, so it is contended that the profit of the individual is identical with and inseparable from the interest of the nation to which he belongs. A certain number of Free Trade writers and orators, and among them Lord Ashleigh, have, indeed, contented themselves of late years with the assertion that the Free Trade system is simply of the best advantage to the inhabitants of these islands; but as the arguments on which this assertion is based are drawn entirely from the original thesis of their creed, it will be better to postpone a discussion of them to a later period.

The general proposition here put forward is in itself so tremendous as to be almost staggering to the philosophic mind. In no other sphere to which the art of government has been applied has it ever been contended that if the interests of the whole civilised world were left without any governmental control, either of a national or of an international character, the result would be not only the best interests of the whole, but the specialised best interest of any and every state concerned, and, further than that, the absolute best interest of every individual within each separate state. In any other sphere, such as that of war or of police or of social legislation, it would be regarded as

nothing but a strange and perverted expression of the tenets of international anarchy, and it was in a sense so conceived by the small band of philosophic Liberals who gave so much theoretic backing to the practical statesmen and practical manufacturers who carried Free Trade in the 'forties. Brought to the test of experience, the whole doctrine and each of its co-ordinated parts can be proved utterly devoid of foundation; but before approaching the international concept, it will be simpler to go first to the root theory from which that concept springs. Adam Smith, though too practical a man always to carry his views to their logical conclusion, declared when speaking of the employment of capital that the study by every individual of his own advantage 'naturally or rather necessarily leads him to prefer that employment which is most advantageous to society.' The reasons which led Adam Smith to this somewhat startling conclusion are stated by himself with admirable simplicity: 'No regulation of commerce can increase the quantity of industry in any society beyond what its capital will maintain. It can only divert a part of it into a direction in which it might not otherwise have gone.' The individual capitalist thus 'labours to render the annual revenue of the society as great as he can.' On this primal contention is built the whole gigantic edifice of the Cobdenite creed. It follows, according to Adam Smith, that the only effect of state regulation of industry must be to transfer capital and labour from an industry which by nature pays better, and is therefore preferred by the capitalist, to an industry which, if left to its own devices, will not pay either the individual capitalist or, in consequence, the nation as a whole as well as the alternative one. The capital or 'stock' to be employed to the individual and national advantage is of course regarded either as a fixed quantity or something which can only be increased by the savings made out of the industry. From this view the modern Protectionist dissents on the following grounds: (1) that it implies a static conception of national trade—that is to say, the belief that because at any given moment production abroad may in a given industry be cheaper than production at home, it follows that that fact represents an unalterable and natural state of affairs; (2) that it presupposes the absolute and equal fluidity of capital and labour between one industry and another; (3) that it implies that the national capital is of a precisely similar character to the capital of the individual. Against all these contentions, and against many other trade theories which spring inevitably from them, the Protectionist can bring unanswerable objections in so far as the dogmas concerned are represented as being eternal and universal in their application. The first theory would go far to stereotype industry in any country which applied it; for the important point, as List has said, is not the interchange of present values, but the potential productive powers of the country. Professor Ashley has put the point with such force and moderation that I may perhaps be allowed to quote from his book on *The Tariff Problem*:

'To take the favourite example of Mill, Poland had once an "advantage" over England in the production of wheat. Will it be maintained by any who know the social conditions of Poland that it would have been well for Poland that it should continue to be a purely agricultural country?

'The point is one of more than antiquarian interest. Adam Smith's whole conception is a static one—of permanent advantages enjoyed by one country over another. But suppose goods are for a time offered to us at a lower price than that at which they can as a rule be produced in the country of origin. Suppose the cheapness does not corre-

spond to a real advantage enjoyed by the exporting country, but to a temporary need. Suppose that our buying them, and refusing to protect the competing industry, means *not* that we permanently enjoy the lower prices, but that when our market is captured and the competing English industry is killed (for a time or for ever) we have to pay (for a time or for ever) higher prices than we otherwise should. Does it follow in this case that "what is prudence in the conduct of a private family"—to buy in the cheapest market—"can scarce be folly in that of a great kingdom?"

It is, in fact, to this general conception of the dynamic energy applied under government protection to the development of potential internal resources that Germany and the United States owe their present position. Without the application of this tariff theory the long lead that this country had obtained in trade and industry must have retarded, and in many cases destroyed, their nascent industries and their growing populations. It is hardly, perhaps, necessary at this point of the prolonged tariff controversy to labour the contention that capital cannot and still less can labour be transferred without loss from one source of employment to another. But the mistake is not without its significance in the history of Free Trade philosophy. The whole Free Trade theory is based upon the doctrine of the mobility of capital, and this doctrine springs in turn, as has been stated, from the dogma that private and national capital are identical. The real national capital is something very different, something of which the individual capital is merely the by-product. National capital consists of the actual or potential products of the soil, and of the actual or potential energy, acquired skill, morality, and intelligence of its inhabitants. It surely does not require much insight to see that industry might well be conducted in such a manner as to increase the individual capital while it positively decreased the capital of the nation. A capitalist, for instance, who under the stress of altered industrial conditions gradually withdrew his business from the manufacture of a highly finished article through every process of that manufacture, and turned it into a business for the supply of partially finished articles to be made up abroad, might quite possibly actually increase his turnover and so increase his private capital. He would do so, however, at the cost of throwing out of employment the long-acquired skill of hundreds of men who would have little prospect of any further employment save that of casual labour. The national capital would have been depreciated to the temporary advantage of the individual concerned. In other words, the Protectionist is peculiarly insistent on the character of the trade which the nation does, because it is on that character rather than on any other aspect of it that the safety and increase of real national capital in effect depends.

A precisely similar line of argument applies to the universal conception of Free Trade. The tendency of any such movement, were it ever realized, would not necessarily result in the greatest possible production of the whole world's wealth. Least of all would every individual nation profit under such a scheme. The natural result, as Cobden and his friends well knew when they worked for universal Free Trade in the 'forties, would be to standardise existing industrial conditions in the interests of the parties who possessed at the given time the overwhelming lead in any particular industry. As a consequence, the national capital of many countries—that is to say, the local products and the local energies of the weaker countries—would be indefinitely denied the opportunity to fructify, and these potential sources of power would be com-

pelled on the ground of cheapness of consumption to remain hewers of wood and drawers of water for their more highly developed neighbours. Nationality and national protection have, so far from holding back the development of the world, been of the greatest assistance in increasing the total international output.

The general theory of Protection outlined has been, as a matter of fact, followed, except at more or less brief intervals, by the government of England ever since the time of Edward III. Yet so short is the memory of people to-day that until recent years the great majority of the inhabitants of this country unquestionably regarded the policy of Protection as an almost revolutionary proposal, instead of a return to the fundamental conceptions of English policy. The prohibition of the export of wool in the reign of Edward III. in order to develop the great woollen industries of this country is precisely in accord with the general view of modern Protection, and would find an exact parallel if the United States placed a tax on the export of raw cotton in order to develop further their own cotton industries. Whether the application of such a policy is or is not wise under particular conditions has long ceased to be of practical interest to this country, since, with the exception of coal, the United Kingdom has ceased to be an exporter of raw material. It is sufficient to observe that the legislature of Edward III. had grasped the fact that it was the character and paying quality of trade as represented by skill and wages that was of real importance, and that, compared to this, the bulk of export trade remained a matter, as it remains to-day, of comparatively minor importance. Internal discussions, however, made a consecutive fiscal policy quite impossible until the end of the Wars of the Roses brought a strong central executive once more into being. Indeed, it may be observed that the unity of the kingdom and the internal peace which strong central government brought with it has throughout English history always been accompanied by a protective fiscal system. On the other hand, the intervals of Free Trade have nearly always synchronised with periods of internal disturbance which left the government too preoccupied for any measures of external trade defence. The only exception—if it be an exception—to this general thesis is the period of Henry VII. and Henry VIII. But Henry VII. was insanely seated on the throne, and Henry VIII. mainly concerned with the religious difficulties he had himself partly evoked. The distress resulting from the latter monarch's internal policy was such as to induce the government of Elizabeth to introduce a drastic system of Protection. 'The importation of finished goods from abroad was prohibited early in her reign. The list of articles to be excluded is not as lengthy as that in the statutes of Edward IV. or Richard III.; . . . but the principle of action is precisely similar to that of preceding monarchs, and the preamble urges the old pleas in the encouragement given to artisans abroad and the consequent enrichment of other realms while our own workmen were unemployed. The exportation of unmanufactured products which might be worked up at home was also restricted' (Cunningham, *Growth of English Industry*, vol. ii. p. 201).

Here again we see the vital Protectionist principle of discouraging both the import of highly finished goods which might be made at home, and the export of raw materials which might also have been made up in England. This policy was continued, with a few exceptions, from the time of Elizabeth to the time of Adam Smith, and undoubtedly laid the foundations of the national greatness and prosperity. Cromwell, indeed, was

one of its chief executors, since the Protectorate represented a moment when the central government was strong and the national spirit high. The justification of the policy, with all its occasional puerilities, must be found in the establishment of the great English industries on a permanent and successful basis long before the inventions of the later 18th century and the Napoleonic wars gave to a country secure from invasion and rich in coal and iron an almost unique economic opportunity. The England of the Middle Ages was of all European countries, except Prussia or Russia, the farthest removed from the centres of art, civilisation, and industry which still clustered round the Mediterranean or were to be found scattered up the great waterways of France and Germany. English civilisation could in consequence no more compete without a Protective system against the finished products of the great European municipalities than the inhabitants of the Sudan to-day could, if the raw materials were available, start unaided a cotton manufactory able to compete with Lancashire. The wisdom of our governors, however, laid the foundations of our future prosperity firstly in the Middle Ages, and secondly in the time of Elizabeth.

A similar policy was pursued in dealing with our Dutch and Flemish rivals. In politics and religion the England of the Reformation was in close agreement with its nearest European neighbours, but in trade and commerce the two sides of the Channel were in the fiercest competition. The Navigation Laws of 1651 were devoted entirely and not without success to the suppression of our chief competitors, while our naval policy was largely dictated by similar considerations. Holland and the Flemish provinces were in their time, and for the comparisons of their time, as great a commercial power as this country was in the middle of the 19th century. None the less, this country by a combined policy of war and of tariffs crushed them out of existence as a serious naval or commercial rival. Such a result could never have been obtained by any adherence to the ideas of the orthodox Free Trade economists. On the contrary, Cobdenism could only have led us to perpetuate in the interests of French, Italian, German, or Dutch manufacturers a temporary inferiority of production.

All these historical facts are so far beyond dispute that the change of fiscal policy in the 19th century would on the face of it appear amazing. But the explanation is, after all, extremely simple. So long as England was the country with potentialities in its soil and an undeveloped people, a policy of protecting native industries, in order to give the dynamic of the people and of the soil full play, not only commended itself to all statesmen of common-sense, but was inevitable unless both population and industry were to stagnate. The conjoined facts, however, of the Napoleonic wars and of inventions which placed a premium on the presence of coal and iron within the same areas utterly changed the whole surface of affairs: while the Navigation Laws, the commercial system of the 18th century, and the victories of our fleets on the seas had bestowed on us a vast increase of capital as the result of a great extension of our markets. The historic position thus becomes reversed, and it is the crippled industries of Europe or the nascent industries of the New World which become clamorous for protection against the dominant influence of an England which is able to undersell them within their own markets. The first and perhaps the most significant symptom of this change of front is to be found in the policy of Alexander Hamilton when faced with the British attempts to undersell the American market. 'In the beginning of the year 1792,' says the address

of the American Society for the Encouragement of Domestic Manufactures published in 1817, 'when the report of General Hamilton, then Secretary of the Treasury, made by order of the House of Representatives was published in England, it created such alarm that meetings were held in the manufacturing towns, and Manchester alone subscribed £50,000 towards a fund to be vested in English goods and shipped to this country for the purpose of glutting our market and blasting the hopes of our manufacturers in the bud.' This raiding of the American market by what would be known to-day as the process of dumping was continued again after the close of the war of 1812-15. Lord Brongham, referring in 1816 to the flooding of American markets with the produce of British factories upon the opening of American ports at the close of the war, said: 'It is well worth while to incur loss upon the first exportation in order by the glut to stifle in the cradle those rising manufactures in the United States which the war had forced into existence contrary to the natural course of things. Eighteen millions worth of goods were exported to North America in one year, and for a considerable part of this no returns have been received' (Curtis, *Industrial Development of Nations*, vol. i. p. 135).

This early development of the Cobdenite policy throws a considerable light on later developments. From henceforward Great Britain had outlived for the moment the needs of industrial protection for the simple reason that it was stronger in the field than any of its possible competitors. It was therefore, as Cobden perceived with insight and with truth, concerned to preserve a more or less static condition of the trade of the world. The import duties on foreign manufactures were useless, since they produced no effect except a small revenue for the exchequer; while the remains of the somewhat antiquated code of the eighteenth century hindered here and there the importation of raw materials. On the other hand, as the realisation of these facts began to force itself on the impoverished industrial countries of Europe, a tendency towards Protection at once made itself manifest. It is significant that the first petitions for Free Trade, whether insular or international, come from London merchants and manufacturers when protective duties are first placed on British imported goods after the close of the great war. Indeed, the culminating efforts of the thirties and forties to modify our tariff system were inspired to no small extent by the vain hope that a Free Trade England could win in a Free Trade Europe and America. That hope, although it failed, and failed disastrously, in the long-run, yet obtained for a certain period some kind of fruition in fact, and it remained for the foreign tariffs of the seventies, eighties, and the nineties to destroy for ever the pleasing illusion that the world would embrace Free Trade in order to rivet upon it the shackles of a British industrial domination.

The history of this development may be read in the relative figures of American, German, and British trade, in so far as those figures are obtainable. In all cases one may observe a great rise in the relative output and production of the protected countries, and in consequence a relative falling back of British pre-eminence in industry. The old justification of the Free Trade position has thus once more disappeared, and any responsible statesman is bound to consider whether a change in the existing circumstances of trade is not bound to lead to a change in our fiscal policy. In other words, we recur once more to the pre-Adam-Smith period, and must examine with the utmost care all those curious shibboleths on which a Free Trade England was based.

The symptoms which mark the trade conditions of to-day first began to appear in the early 'seventies. Up to that period the vast increase in the volume of foreign trade which took place from 1850 till 1870 seemed to the lay mind the complete justification of a Free Trade policy, although that policy was from the industrial point of view almost entirely unconnected with the dramatic events of 1846. The abolition of import duties had been a gradual process, beginning in the early 'twenties and not completed until the end of the 'sixties. None the less, the nation had confused the Anti-Corn-Law agitation with the general creed of Cobdenism, and regarded the increase of its production as in some sense connected with the repeal of the Corn Laws. The result was the entire collapse not only of any possible Protectionist reaction, but even of the body of thought in the Conservative party which held the Protectionist point of view. As a consequence, the rapidly changing conditions of international exchange and production found few people in this country to mark them, or to point out their tendencies to their less observant fellow-citizens. In the meantime both foreign tariffs began to grow in height and foreign industries in size, with the result that the British increase in industry became less relatively marked than had been the case in the 'forties, 'fifties, and 'sixties. In 1878 Bismarck launched the first high protective German tariff, and the United States were not slow to follow in a series of protective measures which culminated in the McKinley tariff. In face of this development abroad, all the old philosophic weaknesses in the Free Trade position became by degrees more and more apparent. The joints in the armour, invisible as long as this country maintained a clear industrial lead, became gaping rents as soon as external competition became again for the first time in a hundred years a formidable factor in our domestic economy.

We are thus face to face to-day in a changed world with all the old trade dogmas based on the original static view of industry held by Adam Smith and his later disciples. Trade and industry, we are told once more, follow their own natural channels to the best advantage of the whole country. Imports pay for exports or exports for imports; and whatever the character of the exchange, the fact that such an exchange *exists* proves that it is the most profitable form of commerce both to the individuals concerned and to the nation at large. Again the Protectionist reply is simply that because the trade pays the individuals concerned in it, this does not prove for a moment that if the change in it be of a certain character it is not over a period of years impairing the productive efficiency of the people, which is the real capital of the country. The export of machinery for cotton manufacture to be erected in new mills in Japan was unquestionably profitable to the exporters concerned. The next step was an enormous demand for semi-manufactured cotton goods to be exported and finished by the new Japanese cotton industry, an industry which employs labour under conditions fortunately impossible in this country. Again the immediate process was unquestionably extremely profitable. Yet if the net result in the course of years were to be, as it is likely to be, the loss to our Japanese competitors of the cotton market in the Far East, the net result would hardly be a satisfactory one for the total production of Lancashire or the productive efficiency of the working men of that country. Our cotton exports to the East would, in a word, be changing their character, and would tend more and more to be partially finished instead of fully manufactured products. Once more, the

prosperity of the country is determined by nothing except its total production, and if an extension of foreign trade leads in the long-run to a diminution or check on that production, it is a national evil and not a national good.

Further, the development of modern industry has produced certain new features of which Adam Smith in the days of home employment could never have dreamed. Cheapness of production has become largely dependent on the size and sustained volume of the output. In other words, a manufacturer in one country may have precisely the same 'natural' advantage as his rival in another; his wages bill and his freight charges may be the same, and the cost of his raw material may be identical. But if he possesses a larger market, and particularly in addition a nearer market, than his foreign competitor, he would be able to undersell him in the open market. This admitted fact has a peculiar significance at the present day, because the world consists partly of protected countries and partly of Free Trade or semi-Free-Trade countries. The German manufacturer, for instance, possesses a very adequate degree of protection in his own home market. He has, in addition, a free market in Great Britain, and beyond that he has an equal *entrée* into what are commonly known as the neutral markets. His British rival, on the other hand, has no monopoly of his home sales—which, indeed, he must contest with any rival; while in the protected zones of the world he has to surmount the tariff before he can compete at all. The consequence is a tendency towards restricted and fluctuating production as far as the Free Trade manufacturer is concerned in the two markets first mentioned. On the other hand, the German or American producer has a considerable advantage at home, and at least one free market abroad, and the tendency in his case is towards greater certainty and a greater extension of industry. The result of this difference between the situation in the protected and in the Free Trade market acts with a culminating effect on the struggle for the neutral markets of the world, where as a rule both the protected and the unprotected competitors are on equal terms. The cheaper production given by the greater control on the first two markets tends to enable the Protectionist country to outsell its Free Trade rival in the markets more or less open to both.

This particular disadvantage has been intensified by another modern industrial development. It is of the utmost importance for the profitable conduct of a modern industrial enterprise to keep production at a fairly level rate. If progress is to be made, that progress must not be too rapid, and, above all, a serious reaction, which throws all calculations based both on capital, plant, and skilled labour utterly out of gear, must be avoided. The net consequences of this fact in the tariff world as it exists to-day is the policy of dumping on a Free Trade country. If a depression sets in, it will pay a manufacturer better to keep his plant running full time, and to refrain from dismissing his workmen by relying for his profits on his home market in which he is reasonably secure, and by throwing the surplus of his stock either at or below cost price on any market which is open to him. Here again two conflicting theories of trade come to close grips. The Free Trader would maintain that the home consumer in a Protectionist country has to pay rather more for his goods, while the consumer in a Free Trade country may buy his materials cheaper. But the answer of the Protectionist is again a very simple one, and is based once more on the conception of the dynamic efficiency of the people which underlies his whole logical position. The real result of a policy of dumping is to keep

protectionist industry and all the people employed in it fully engaged, and to enable that industry to take immediate advantage of the first turn of the tide and the first demand for an extended sale. To put it in another way, the protected industry and the protected country feel the depression less, and recover from it far more rapidly. On the Free Trade side nothing is gained except a slight reduction in price in some specified article; while the industry, taking, for instance, the tin-plate industry, is thrown into a state of complete disorganisation either from the point of view of labour or the point of view of capital. Part of its works have to be closed down, and the skill accumulated is dispersed by throwing the unwanted workmen on to the casual labour market. A British tariff would make it far more difficult for any rival country to resort to this particular method of attack. It has only been possible to state in general terms, for indeed space forbids a detailed examination of statistics or of a vast number of particular instances, the main ground of contention between the two schools of thought. The problem of the tariff will, as time goes on, grow more and not less insistent as the relative strength of our foreign competitors grows greater and greater, and as the facts which form the basis of the Protectionist case stand out in an ever-clearer light. As this development progresses there must be an ever increasing probability that the United Kingdom will return to the principles which, in Disraeli's words of 1846, 'have made and kept England great.'

[For the other side of this problem, see the article FREE TRADE.]

Protective Coloration. See MIMICRY, PIGMENTS OF ANIMALS.

Protector. a title sometimes conferred on the regent during the sovereign's minority—as on Humphrey, Duke of Gloucester, in 1422; on Richard, Duke of Gloucester, in 1483; and on the Duke of Somerset in 1547. In 1653 Oliver Cromwell took the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland. His son Richard was never formally installed in the Protectorate.

Protectorate. See COLONY.

Proteins. Proteids, proteid substances, and albuminoids are names formerly applied almost indiscriminately to a large and important group of substances—some of animal origin and some of plant origin—which are now known collectively as proteins. The proteins are all complex nitrogenous compounds, the proportion of nitrogen usually varying from about 15 to 17 per cent., although in some instances it amounts to as much as about 30 per cent. They also contain, as a rule, over 50 per cent. of carbon, with about 22·5 per cent. of oxygen, about 7 per cent. of hydrogen, and a much smaller proportion of sulphur (from less than 0·5 to about 2 per cent.). They make up the major part

of the nitrogenous constituents both of plants and of animals. Individual proteins differ very considerably from one another in their chemical and physical properties, as may be appreciated readily on recalling the greatly differing properties of, for example, ordinary gelatin, the albumen of the white of an egg, and the materials composing horn and hair. The first two of these are dissolved by cold water, while the substances last named are insoluble in water and in solvents generally. Many of the proteins which dissolve in water undergo a change called coagulation when their solutions are heated to a moderate temperature. This occurs to the white of an egg when boiled, and the coagulum obtained is insoluble in water. Coagulation also takes place in many instances upon the addition of alcohol, or of various mineral acids or metallic salts to the aqueous solutions of proteins. Dissolved proteins are good examples of colloid substances, and some of their most important properties depend upon their character as colloids. A certain proportion of suitable protein matter is indispensable as a constituent of the food of animals. In the processes of digestion the proteins are resolved, with the aid of enzymes, and by interaction of the elements of water (hydrolysis), into mixtures of easily soluble substances of much less complexity.

Proteles. See AARD-WOLF.

Proterosaurus (Gr. *proteros*, 'first,' *saurus*, 'reptile'), a genus of fossil reptiles occurring in the Permian system, which is the lowest horizon at which reptilian remains have as yet been detected. It is a primitive generalised type, with a single surviving relative in the 'New Zealand Lizard,' *Sphenodon* (q.v.).

Protestantenverein, an association of Protestant ministers, professors, and others belonging to the 'liberal' or advanced school of theology in Germany, formed in 1863 to promote what its members insisted was the spirit of true Protestantism in opposition to what they regarded as reactionary and obscurantist. By the orthodox and conservatives the association was denounced as nationalist or infidel.

Protestantism, a term derived from the part taken by the adherents of Luther in *protesting* against the decree passed by the Catholic states at the second diet of Spire or Speier in 1529. This decree had forbidden any further innovations in religion, and enjoined those states that had adopted the Reformation so far to retrace their steps as to reintroduce the Mass and order their ministers to avoid disputed questions, and to use and explain the Scriptures only as they had hitherto been used and explained in the church. The name is repudiated by a considerable section of the Anglican Church. See CHURCH HISTORY, LUTHER, REFORMATION.

Proteus, in the Homeric or oldest Greek mythology, appears as a prophetic 'old man of the sea' (*haktos gerôn*), who tends the seal-flocks of Poseidon (Neptune), and has the gift of endless transformation. His favourite residence, according to Homer, is the island of Pharos, off the mouth of the Nile; but according to Virgil, the island of Carpathos (now *Skarpanto*), between Crete and Rhodes. Here he uses at mid-day from the floods, and sleeps in the shadow of the rocky shores, surrounded by the monsters of the deep. This was the time when those who wished to make him prophesy must catch him. But it was no easy task. Proteus, unlike most vaticinal personages, was very unwilling to prophesy, and tried to escape by adopting all manner of shapes and disguises. When he found his endeavours hopeless he resumed his proper form, and then spoke out unerringly about the future.

Proteus, a genus of tailed amphibians with persistent gills, represented by a single species (*P. anguinus*) in the caves of Carniola and Dalmatia.

pairs of bright red gills), and their blindness, for the eyes are hidden below the opaque skin. It has been shown, however, that sensitiveness to

Proteus anguinus.

diffuse light persists. In an illuminated laboratory the olm or *Proteus* soon develops pigment and becomes dark in colour. Larvæ reared in red light show a very striking development of the eye, which reaches the skin and becomes capable of some vision. A related form, *Typhlomolge rathbuni*, also blind, has been obtained from an artesian well in Texas—a near relative at a great distance! A nearly related genus, *Neurinus*, lives in North American rivers and lakes.—The name *Proteus annulatus* was formerly used as a synonym for *Amphibia* (q.v.).

Protevangelium, a very old apocryphal gospel attributed to James, the brother of the Lord (see APOCRYPHA); also used of a primitive gospel (Ger. *Ur-evangelium*) from which it has been held several of our gospels were derived. See GOSPEL.

Protococcus (Gr., 'first grain'), a genus of very simple unicellular green plants, one species of which (*P. viridis*) is everywhere abundant as a green film on tree-trunks and damp walls, or in stagnant rain-water. The colour is sometimes reddish, and the organism may be found passively encysted during drought, and at other times actively motile with a couple of cilia. See ALGÆ.

Protocol (Gr. *prôtos*, 'first'; and *kolla*, 'glue'), (1) the rough draft of an instrument or transaction, and more particularly the original copy of a government despatch, treaty, or other document; (2) a record or register.

Protophages, a painter of ancient Greece, was born at Cannus in Caria, and practised his art at Rhodes, where he worked steadily on through the din of the siege of 305–304 B.C. A contemporary and friend of Apelles (q.v.), he was a slow and careful painter, sparing no pains to secure a natural and finished piece of workmanship. His best-known pictures were *Iulysus* (a Rhodian celebrity), a *Satyr*, '*Paralos* and *Ammonias*' (sacred ships of the Athenians, executed for the Propylæa at Athens), '*The Thesmopheta*' (for the Athenian senate-house), '*Alexander* and *Pan*,' '*Cydippe* and *Tleptolemus*,' and some portraits.

Protogine (Gr., 'first-born'), a granitic rock, composed of the same ingredients as true granite, but the mica is more or less altered so as to resemble talc, for which it was formerly mistaken. It received its name because it was supposed to

have been the *first-formed* granite. It abounds in the Alps, and is sometimes called Alpine granite. The term *Protogine*, however, is now rarely used, since modern research has shown that the rocks so named are simply altered, often gneissic, granites.

Protonopsis. See MENOPOMÉ.

Proto-notary, a member of the College of Proto-notaries Apostolic in the papal curia, whose duties are to register pontifical acts, make and keep the records of beatifications, &c.

Protophytes (Gr. *Prôtophyta*, 'first plants'), a term often applied to the simplest plants, such as *Protococcus* in the algaoid, and *Bacteria* in the fungoid series. See ALGÆ, BACTERIA.

Protoplasm (*prôtos*, 'first,' *plasma*, 'formed substance') is a technical name for living matter. The term was first applied (1846) by the botanist Hugo von Mohl to the 'slimy, granular, semi-fluid' contents of vegetable cells, but before that Rösel von Rosenhof (1755) had studied the amoeba, which is a unit mass of relatively pure living matter. Robert Brown and other botanists had watched the rotation of the living substance inside the cells of some plants, and Dujardin (1835) had described the 'sarcode' of Foraminifera as 'a glutinous, transparent, living jelly.' After Dujardin and Von Mohl had thus directed attention to 'sarcode' and 'protoplasm,' observations on both gradually accumulated, the idea began to be mooted that the two substances were essentially the same, and in 1861 Max Schultze defined the cell as a nucleated mass of living matter or protoplasm. Huxley's description of protoplasm as 'the physical basis of life' is very convenient, if it be recognised that, while there may be something common to all, the protoplasm of one kind of organism is specifically different from that of another. If the whole cell-substance be called cytoplasm, and the obviously unessential non-living inclusions, such as pigment granules or starch grains, be called metaplasm, then the theoretical subtraction of metaplasm from cytoplasm would leave protoplasm. The probability is that there is no one substance that can be called protoplasm, but that it is a subtle mixture of proteins and other complex substances. Protoplasm may be conveniently studied in the unicellular Protozoa, such as *Amoebæ* and Foraminifera: in a spreading mass like 'Flowers of Tan' and other 'slime Fungi'; in the colourless cells of the blood; in the ova of animals where there is not much yolk, as in sea-urchins and pond-snails; in young vegetable shoots and animal embryos; or in the cells of a relatively simple plant, such as the Stonewort (*Chara*) or the filamentous *Spirogyra* from the ditch.

When a tissue is treated with some 'fixative' such as osmic acid or corrosive sublimate, cut into very thin sections, stained with differential dyes, and mounted in a suitable preserving medium such as Canada balsam, there is often some heterogeneity of structure to be seen in the cytoplasm of the cells studied under high magnification. A net-like structure is often visible, and besides this reticular appearance there may be hints of fibrils, alveoli, and so forth. Much time has been devoted to describing and depicting this minute structure of cytoplasm, but it is now generally recognised that it is in the main the result of the artificial fixation. Different fixatives give different results in the same kind of cell, and Hardy has shown that the reticular appearance can be induced in perfectly structureless gelatine or albumin. As a matter of fact, there is no visible structure in living protoplasm, though there is reason to suppose that very fine film-like partitions, such as those visible around vacuoles, divide the substance into areas, within which different chemical processes may go on.

Ordinary living protoplasm is in a colloid state; innumerable minute particles or immiscible droplets are suspended in a fluid medium, and it is not usual for protoplasm to contain less than 80 per cent. of water. Small granules in cells are sometimes seen to be in constant 'Brownian movement,' which is due to their being buffeted by moving molecules of the fluid. This is best seen when the difficult method of 'dark ground illumination' is employed, in which particles too small to be actually observed even with the strongest lenses betray their presence by intercepting rays of light and appearing as bright spots in a dark field. These bright spots are seen to move freely through the protoplasm. The use of ultra-violet light, instead of visible light, for microscopic photographs has also been helpful; for in this region of the spectrum of radiations some materials quite transparent to ordinary light appear opaque, and the structure of the cell is thus more easily discerned. But ultra-violet light has a disturbing action on fluid protoplasm. The method of micro-dissection, in which cells while under the microscope are dissected or injected with various fluids by means of extraordinarily fine needles operated by delicate screws, has given valuable information in the hands of such workers as Kite and Chambers.

These various methods of investigation all point to the conclusion that protoplasm is a fluid, of very varying viscosity, and sometimes of jelly-like solidity in part. There may even be an alternation between more solid (*gel*) and more liquid (*sol*) conditions in one and the same area of the cell, notably in amoeboid movement. Various agents cause the protoplasm to become more solid, and an irreversible coagulation of the fluid occurs when the cell dies or is killed by a fixing agent. The living material of the cell includes proteins, carbohydrates, fats, ferments, inorganic salts, and water; and much depends on the fact that the innumerable particles and droplets in a liquid system must present a large surface for chemical and physical changes. The organic material in the cell appears to be partly in colloidal and partly in true solution; the rapidity with which changes take place points to the action of enzymes or ferments; the complexity of processes occurring on the heels of one another within very minute dimensions points to the presence of intra-cytoplasmic, ultra microscopic films dividing the cell into areas, and as the cell-membranes do for a tissue or organ or body as a whole.

We may regard protoplasm as a complex substance or mixture of substances, which shares directly in the constant chemical and physical changes or metabolism of the organism. It is the climax of an ascending series of constructive or synthetic steps, by which food material becomes more and more complex and unstable; it is subject as the organism lives to constant disruptive or analytic changes, which result in the liberation of energy and in the formation of simpler and simpler waste products. Thus protoplasm is regarded as the changeful central substance in metabolism; it is continually being unmade, breaking up, and wasting as it lives; it is continually being made by the constructive processes of repair. We call the repairing or constructive process *anabolism*, and its chemically discernible steps *anastates*; we call the discharging or disruptive process *katabolism*, and its chemically discernible steps *katastates*.

But, on the other hand, we may regard protoplasm as a kind of ferment which influences the material round about it without itself being so directly affected as the previous conception implies. It is the relatively stable cause of metabolism, acting on less stable material of a less complex nature, acting upon it so that constructive ana-

bolic processes or disruptive katabolic processes predominate for the time.

The English physiologist Gaskell, prompted by his researches on the functions of nerves, some of which command activity while others induce rest, was led to regard what he called anabolism and katabolism as processes which bear to protoplasm a relation similar to that which sleep and wide-awake life bear to the organism. The 'winding-up' process of anabolism or restitution goes on (autonomically) of itself; the 'running-down' process of katabolism or discharge is determined by stimulus. Anabolism is comparable to the self-loading, katabolism to the stimulated firing of a gun. But the German physiologist Hering, prompted by his researches on colour-sensations, was led to regard what he called assimilation and dis-assimilation as two antagonistic kinds of activity, both dependent on stimuli which differ in their direction and results.

Huxley's famous address on *The Physical Basis of Life* and Hinchison Stirling's essay *As Regards Protoplasm* may be cited as outstanding types of the numerous endeavours which have been made to understand the relation between protoplasm and mind. On the one hand, we know through our senses the colloidal material that we call protoplasm; on the other hand, we know this and much else because we have minds. That it is hopeless to try to explain such irreducibles as protoplasm and thought, that thought is only a function of protoplasm, that protoplasm is only a form of thought, that thought and protoplasm are different aspects of one reality, are the respective conclusions of the agnostic, the materialist, the idealist, and the monist philosophers who have theorised about living matter.

Prototheria. See ECHIDNA, MAMMALS

Prototracheata. See PERIPATUS

Protozoa (Gr. *protos*, 'first,' and *zōon*, 'animal'), simple unicellular animals, contrasted with the multicellular Metazoa. Except in a few cases, each Protozoon is a single cell, a unit-mass of living matter physiologically complete in itself. This implies the absence of tissues and organs, and of sexual reproduction in the ordinary sense. Yet a Protozoon may show great intricacy, and two individuals may unite in mutual fertilisation. A Protozoon is to any higher animal, from sponge onwards, as an egg cell is to the body into which it develops. But the exceptional cases to which we referred are very important—they are loose colonies or aggregates of Protozoa. Formed by the incomplete separation of dividing units, they bridge the gulf between single-celled and many-celled animals. Simplest of Protozoa are such forms as *Protoxyma*, whose life is a succession of changeeful phases, amoeboid, encysted, flagellate. The others may be classified according to the predominance of one or other of these phases. The Rhizopoda, predominantly amoeboid, include *Amoeba* and others like it, *Foraminifera*, *Heliozoa*, and *Radiolaria*. The Gregarines are predominantly sluggish and encysted. The Infusorians are usually active, ciliated, or flagellate. These classes of Protozoa are discussed separately.

Protractor, a mathematical instrument, used in drawing or plotting, for the laying down of angles. It is variously shaped, and may be circular, semicircular, or rectangular.

Proud-flesh is the popular term for coarse and too luxuriant granulations springing up on Wounds (q.v.) or Ulcers (q.v.). See also INFLAMMATION.

Proudhon, PIERRE JOSEPH, a noted French socialist, was born July 15, 1809, at Besançon, in which town his father was a poor cooper. Through the good offices of charitable friends, he received the rudiments of his education at the college of his native place, and from the first gave great promise of talent. While still very young, however, he quitted the institution in order to aid his family, who had fallen into great distress, and sought employment in a printing establishment. Here he was noted for the most punctual discharge of duty; and, in the hours not occupied in work, he contrived, by a rare exercise of resolution, to complete and extend his education. In 1830 he declined an offer of the editorship of a ministerial journal, preferring an honourable independence as a workman to the career of a writer pledged to the support of authority. In 1837 he became partner in the development of a new typographical process; was engaged on an edition of the Bible, to which he contributed notes on the principles of the Hebrew language; and in 1838 published an *Essai de Grammaire Générale*, in approval of which a three years' bursary of 1500 francs was awarded to him by the Académie de Besançon. On this accession of funds he paid a visit to Paris; and subsequently contributed to the *Encyclopédie Catholique* of M. Parent Desbarres the articles 'Apostasie,' 'Apocalypse,' and others. In 1840 he issued the work entitled *Qu'est-ce que la Propriété?* ('What is Property?') which afterwards became so famous. The nature of the doctrine announced in it is sufficiently indicated in its bold paradox, soon to be widely popularised — *La Propriété c'est le Vol* ('Property is Theft'). Notwithstanding his attack on property, which gave great offence to his patrons, Proudhon held his pension for the regular time. In 1842 he was tried for his revolutionary opinions, but was acquitted. In 1846 he published his greatest work, the *Système des Contradictions Économiques*. During the revolution of 1848 Proudhon attained to great notoriety. He was elected member of Assembly for the Seine department, but he could not there gain a hearing for his extreme and paradoxical opinions. He found more adequate scope for his energy in the press, publishing several newspapers, in which the most advanced theories were advocated in the most violent language. He attempted also to establish a bank which should pave the way for a socialist transformation, by granting gratuitous credit, but failed utterly. The violence of his utterances at last resulted in a sentence of three years' imprisonment, and in March 1849 he fled to Geneva, but returned to Paris in the following June, and surrendered at the prison of Sainte Pelagie.

While shut up there he married a young working-woman. During his imprisonment he gave to the world the works entitled *Confessions d'un Révolutionnaire* (1849), *Actes de la Révolution* (1849), *Gratuité du Crédit* (1850), and *La Révolution Sociale démontrée par le Coup d'État* (1852); the last of which is remarkable, in the light of subsequent events, for the clearness with which it states the alternative of *l'anarchie ou le Césarisme*, as pressed on Louis Napoleon, then president. In June 1852 he was set at liberty, but in 1858 was again condemned to three years' imprisonment, and retired to Belgium, where he continued to publish from time to time on his favourite subjects of speculation. Amnestied in 1860, he died in obscurity near Paris, January 19, 1865.

The theories of Proudhon cannot be presented in a clear or systematic form; we can only give some account of the most important of them. He held

that property was theft, inasmuch as it appropriates the value produced by the labour of others in the form of rent, interest, or profit without rendering an equivalent. He maintained that one service can be duly repaid only by rendering another, whereas the owner of land and capital abuses his position by exacting all manner of service without giving an equivalent. His famous paradox respecting *anarchy*, which he regarded as the culmination of social progress, was simply an exaggerated and premature assertion of the great principle that the fully-developed man should be a law to himself—that is, the moral progress of man should make government and external law unnecessary. In the perfect society order would be secured and maintained in the absence of government through the reasonable self-control of the free individual. Laws, police, the whole machinery of government as now established are the marks of an imperfectly developed society. Personally Proudhon appears as an original and not unattractive character in the monograph of Sainte-Beuve, which unfortunately was not finished. His complete works fill 33 vols. (Paris, 1868-76); his correspondence, 14 vols. (1874).

See Sainte-Beuve, *Proudhon, sa Vie et Correspondance* (1872); A. Desjardins, *Pierre Joseph Proudhon* (1896); the articles ANARCHISM, SOCIALISM, and works there cited.

Proust, MARCEL, French author, was born in 1873, the son of a doctor in government service in Paris. His mother was a Jewess. From childhood he was an invalid, a circumstance which influenced his life and his writings. He adopted no profession, though early he launched a short-lived review (*Le Banquet*) and for a time contributed society gossip to the newspapers. His first work, *Les Plaisirs, et les Jours*, appeared in 1896; and in 1904 (*The Bible of Amiens*) and in 1906 (*Sesame and Lilies*) he translated Ruskin. By family he was of the wealthy bourgeoisie, but having penetrated to the aristocratic salons of the Faubourg Saint Germain he there won astonishing social successes; these he enjoyed, but not uncritically, and later, in disillusionment and in growing ill-health, he withdrew to a life of literary reclusion, devoted in his *À la Recherche du Temps Perdu* to memorable delineations of the society in which he had moved. In 1919, in *Pastiches et Mélanges*, he gathered together some earlier prose writings. He died at Paris, 18th November 1922. Proust is essentially a man of one work, *À la Recherche du Temps Perdu* (English trans. by C. K. Scott Moncrieff, 1922, &c.), but the work consists of several sections, and each section really of several novels. The first section, *Du Côté de chez Swann*, appeared in 1913, but attracted little attention till in 1919 the second section, *L'Ombré des Jeunes Filles en Fleurs* (1918), was awarded the Prix Goncourt; the third section, part one of *Le Côté de Guermantes*, was published in 1920; the fourth section, part two of *Le Côté de Guermantes* and part one of *Sodome et Gomorrhe*, in 1921; and the fifth section, part two of *Sodome et Gomorrhe*, in 1922; the concluding sections, *La Prisonnière* (1924), *Albertine Disparue* (1926), and *Le Temps Retrouvé*, though not finally prepared for publicity before the author's death, were issued posthumously. The work as a whole is a huge psychological novel. Its subject matter is a compound of autobiographical fact and of ingenious fiction. Throughout, the influence of Freud and of Bergson is to be seen; and there is a pessimism and an extreme sensibility not unconnected, one must think, with the invalidism of the author. The style, sometimes wilfully involved, is peculiar, and is at its best in a kind of mingling of ironic metaphors and subtle allusions. As the work proceeds, signs of exhaustion become apparent. By his admirers Proust has been held to be unique as an analyst of the manners and morals of his time,

and as a psychological novelist to be among the greatest. Detractors, however, have pointed to what in Proust's writings they denounce as morbidity and hyperæsthesia. There is a Life in French by Pierre-Quint (1925).

Prout, FATHER. See MAHONY.

Prout, SAMUEL, painter in water-colours, was born at Plymouth, 17th September 1783. He studied from nature, and sketched with Haydon through Devon and Cornwall, his drawings in the latter county being made for Britton's *Beauties of England and Wales*. In 1805 he removed to London, in 1815 was elected to the Water-colour Society, and in 1818 went to Rouen by Havre. The picturesque street-architecture and fine Gothic remains there made so strong an impression on his mind that afterwards his principal works were those in which architecture had a prominent place; and from time to time, in his after-career, he made excursions, ransacking every corner of France, Germany, the Netherlands, and Italy for picturesque architectural remains. Prout's name should be dear to all artists and amateurs, for there are few who have not been incited or instructed by his numerous elementary drawing-books, in the slightest of which talent and feeling for art are conspicuous. His water-colour drawings are characterised by decision in handling, great breadth, and clear and pleasing colouring. He died February 9, 1852.

See Ruskin's *Memoir of Prout* in *Art Journal* (1852); and his *Notes on the Loan Collection of Drawings by Prout and Wm. Hunt* (1879-80).

Provençal Language and Literature.

The Provençal language is one of the six principal branches of Latin speech, usually classified by philologists under the title Romance languages. The name Provençal, which appears to be derived from the *Provincia Romana* of Caesar, was not used in the earlier middle ages except in the restricted sense of the language or dialect of Provence proper. The troubadours themselves used the term *lingua romanica* (or *to romanca*). The term *langue d'oc* was also known in the middle ages, but was afterwards transferred to designate a province of France. The Provençal and other Neo-Latin idioms existed as dialects of the Latin previous to the Germanic invasions, having replaced the ancient languages of Gaul. Although the Provençal and the northern French had originally sprung from the same stock, they had gradually grown distinct from one another, until at the time of the troubadours they differed almost as widely as French and Italian. The Provençal language at the time of the troubadours extended far beyond the boundaries of Provence proper. It extended over the area from the Alps to the Pyrenees and the Mediterranean to the Loire. Beyond France it was known in the east of Spain—in Catalonia and Aragon, and in the Balearic Isles—also in Savoy, Piedmont, and part of Switzerland.

The pure Provençal idiom, in which the poets of the 12th century sang, was used by the higher classes over the whole of the district referred to, but the bulk of the people knew only their own dialects—viz. the Provençal (proper), Piedmontese, Gascon, and Catalan, all of which differed but slightly from one another. At the end of the 13th century, consequent upon the establishment of the French domination in the south and the introduction of the northern French language, the literary Provençal began rapidly to disappear, while the vulgar dialects still remained; and it was in them that the compositions of the later middle ages were written. The Provençal language was more highly inflected than any of the other Neo-Latin languages, and was

the earliest of these to be fixed grammatically. It was highly adapted for lyric poetry, owing to its melodiousness and its rhyming facilities. The grammarian Vidal referring to it says: 'La parlada francesca val mais et es plus avinens a far romanz et pastorellas, mas cella de Lemosin val mais per far vers et cançons et sirventes' (The French speech is better and more suited for making epics and pastourelles, whilst that of Lemosin [i.e. the Provençal] is better for making love-songs and satires). In the modern Provençal dialects there is to be noted chiefly a greater simplicity of inflections and grammatical forms and a large admixture of French words.

The first employment of the Provençal language in writing dates back to about the 9th century. The few specimens that survive are mostly writings in Latin, but mixed more or less with Provençal words and phrases. It is to the priests and monks that are most probably due the earliest attempts at composition in the Provençal language. In order to arouse the religious sympathies of the people they composed or translated from the Latin into the vulgar idiom pious tales, allegories, legends of saints, &c. There were also introduced into the liturgy, along with the prayers and hymns in pure Latin, others in the popular dialect. In 813 at the councils of Ales, Mainz, and Tours preaching in the popular language was recommended to the clergy. Toward the close of the 11th century a revival took place in Provençal poetry consequent upon the religious wars of the Crusades and the introduction of the institution of chivalry. The influence of the Moors of Spain undoubtedly, too, had its effect in the development of Provençal poetry and culture. The poetry of mediæval Provence has much in common with that of the Moors.

Although it was in the north of France that epic poetry in the middle ages especially flourished, still in the south it was by no means so neglected as many have supposed. Among the earliest compositions in the Provençal language were undoubtedly epic romances, treating either of historical subjects, such as the struggles against the Franks or the wars with the Moors of Spain, or else of the semi-mythical deeds of Charlemagne and King Arthur which formed the basis of the Carolingian and Arthurian (or Round-Table) legends. Of these old popular epics which were sung and so handed down from generation to generation we possess but few traces. From the middle of the 12th century epic poetry may be divided into popular and artistic. Of the first class but few specimens remain, but of the artistic epic they are more numerous, probably owing to the fact that, being recited and not sung, it was more necessary to commit them to writing.

The Provençals did not cultivate the drama like the French; in fact the only productions that might come under this head are pieces on pious subjects in dramatised form, such as the *Mystery of the Passion*, the *Marriage of the Virgin*, &c. Provençal literature was essentially poetic, and its prose works are of little importance. They were in the early period mostly translations from the Latin, sermons and chronicles—also the biographies of the principal troubadours. Later, in the 14th and 15th centuries, prose works became more numerous, and included scientific, juridical, philological, and other works. The lyric poetry is by far the best-known branch of Provençal literature. It was in lyric verse that the Provençal poets gave expression to the sentiments of chivalry and love—of that adoration and devotion to women which had become with them a sort of worship.

The word *troubador* (in Provençal *trobarre*, *trobador*) is derived from the verb *trobar* (Fr.

trouver, 'to find, invent, compose;' from Lat. *turbare*, 'to move,' meaning latterly 'to seek,' and also 'to find'). This verb was used only with reference to the composition of lyric poetry. Hence, strictly speaking, a troubadour means a poet of the lyric form. Epic poets were styled *noellaires* (Fr. *novellistes*, 'romancers'). The troubadours were of two classes—viz. professional and amateur. Amongst the latter were many nobles and even kings, as, for instance, Richard Cœur-de-Lion, Alfonso II. of Aragon, the Counts of Poitou, Provence, and Toulouse; of the professional troubadours also many were of high birth. Generally speaking, the latter were recruited from all ranks of society (merchants, soldiers, monks, lawyers, &c.), and they were of various grades. The majority of the troubadours led a wandering life, frequently travelling beyond the limits of their own country—more especially into Spain, visiting Catalonia and Aragon, and even Castile. Beyond the Alps they visited Piedmont, Lombardy, and Tuscany, where many of them settled. Others—mostly those who were tired of wandering—attached themselves to the households of the great feudal lords, wherein they played an important part. There were no fixed schools of poetry for learning the troubadour's art. They acquired it either by attaching themselves as pupils to some celebrated troubadour, or by visiting the great châteaux which the more distinguished poets were accustomed to frequent. The convent, too, was a great school of song; the monks had both the means and leisure to cultivate the taste for poetic composition, and there were many monks amongst the troubadours. At a later period professors of poetry established themselves in the chief towns of Provence; Peire Cardinal settled as such at Arleson in the 13th century. The first of the troubadours of whom we know was Guillem IX., Count of Poitiers, a powerful noble of the south of France. He flourished towards the end of the 11th century. To the first half of the 12th century belong Cercamon (or *Cherchemonde*); Marcabrun, who was originally attached to the service of Cercamon in his wanderings; Peire d'Alvern, a troubadour of great merit; and Bernard de Ventadorn, who was famed for the grace and sweetness of his poetry. The second half of the 12th and first half of the 13th centuries was the most brilliant period of Provençal poetry. Of the many poets who flourished during this period the following are the most distinguished: Gacebrun Faidit; Gui d'Ussel; Peirols; Arnaut de Marneill, the author of many exquisite love-songs; the talented Folquet, Bishop of Marsailles; Peire Vidal of Toulouse, a versatile and most eccentric poet; Arnaut Daniel, the chief of the artificial school; Giraut de Bornelh, considered by the Provençals themselves to be the finest of all their poets (though Dante and Petrarch both regard Arnaut Daniel as superior to him); Raimbaut de Vaqueiras; Guillem de Cabestani, a most melodious singer; the Monk of Montaudon, a powerful and unsparring satirist; Raimon de Miraval: Ue de Saint Cîr; Guillem Adhemar; Bertrand de Born, the author of many warlike *sirventes*; Guillem Figueira; and Peire Cardinal, the great writer of moral and religious satire. The latter half of the 13th century shows the poetry of the troubadours in its decline, and few of the poets of this period deserve to be classed with those of the previous one. Towards the close of the century lived Guiraut Riquier, a poet of great renown, who has been termed the 'last of the troubadours.' He specially cultivated the popular forms of lyric poetry, particularly the *pastorella*. Among the long list of troubadours (about 400 in all) there

are only about a dozen women-singers of whom we know. Their works, so far as one can judge from the scanty fragments that remain, are much inferior in merit to those of the troubadours. The most distinguished among them was the Countess Beatrix de Dia, who has been termed the Sappho of Provence.

The compositions of the troubadours were intended to be sung to the accompaniment of some musical instrument. In most cases the poets themselves composed the melodies for their pieces. The text was called *motz*, the melody *son*. There is no doubt that many of the troubadours sang and accompanied their own compositions. But those who were unable to do so were obliged to have recourse to professional musicians to sing and play for them. These professional musicians they found among the *joglars* (Fr. *jongleurs*) or wandering minstrels. The origin of the *joglars* dates back to the time of the Romans; they were the descendants of the *jocondiores*, who took part in the ancient circus-games. The *joglars* of the middle ages were a sort of travelling showmen, who gave performances at village feasts, and were often accompanied by trained dogs and monkeys. There were some of them, however, whose profession was rather more artistic than mere buffoonery or jugglery; they became the singers and accompanists of the troubadours. Some were in the service of the troubadours, and travelled about with them; others went about independently, singing the pieces they had either bought or had presented to them by the troubadours. The latter, as a class, held themselves much above the *joglars*, though it sometimes happened that *joglars* rose to the ranks of the troubadours.

It was only from the 12th century that a poetic system began to be fixed, and the different branches of lyric verse received distinctive titles. Previous to that period every lyric poem was termed *vers*, from the Latin *versus*, 'a hymn,' because the early lyric compositions were modelled on the ecclesiastical verses, whatever their subject might be. Epic compositions were termed *prosa*. The two principal branches of lyric poetry were the *canço* or love-song and the *sirventes* or satire. The *canço* was the outward expression of love and its various phases. In order to write the love-song (to *trobar*) it was essential, according to the ideas of Provençals, that the poet should be in love himself, that he should be inspired by the passion before he could give expression to it. Their idea of love, it may be remarked, was not wholly that of romantic adoration; hence the many licentious pieces among the lyrics of the troubadours. The *canço* generally closed with a few lines in which the poet apostrophised himself or his song, and commissioned it to explain his sentiments to his lady-love. This was termed the *formada*. The term *sirventes* or *sirventesc* was used to comprehend only satirical poems, but generally every class of lyric composition that did not treat of love. These were divided into various classes—personal, social, political, moral, and religious—the last named including the songs of the Crusades. In their social satires the troubadours attacked with energy the vices and oppression of the nobles. Attacks, too, on the clergy were frequent, more especially at the time of the Albigenses war, when the poets sided (with one or two exceptions) with the heretics against the Church of Rome. In doing so they do not appear to have been influenced so much by questions of doctrine as by hostility to the northern French intruders, and we do not find any of them putting forward heretical opinions in their works, with the single exception of one piece by Peire Cardinal.

The crusades against the Saracens formed a constant theme enabling the troubadours to celebrate in song their love of daring and glory.

Most of the crusade-songs we possess relate to the third crusade, which took place during the most flourishing period of Provençal poetry. In these songs they exhorted their countrymen to rise and take up arms against the infidels. War in general—not merely religious—was a favourite subject with the troubadours. The most famous writer of warlike *sirventes* was Bertrand de Born (q.v.), a typical mediæval baron.

The *tenso* was a sort of dispute or contention in verse in the form of a dialogue between two troubadours, generally upon some question relating to love or chivalry. *Tensos* actually did take place among the troubadours, although in many of their poems the antagonists would appear to be merely fictitious persons. This form of verse was of eastern origin, and was common among the Arabs and Persians.

Besides the *canço*, *sirventes*, and *tenso*, there existed also simpler, more popular forms of lyric verse. Originally the *balada* was a poem intended to be sung in dancing. It consisted generally of three strophes, and was remarkable for its graceful dance-like rhythm. The *pastorcla* (*pastorella*), or shepherd's song, was always a favourite form of verse with the Provençal poets. The *alba* (or dawn-song) and the *serena* (or even-song) were also cultivated by the Provençals. The latter is to be distinguished from the serenade, and was a poem depicting the longing of the poet for the approach of the night and the meeting with his beloved. *Noras*—tales in verse (compare the north French *Fabliaux*, q.v.)—were few and unimportant among the Provençals compared with those of the French.

The Provençal system of versification was most highly elaborated, the poets observing the most intricate metrical rules in their compositions. An instance of such elaborate verse is the *ses-tun*, which was invented by Arnaut Daniel and imitated by Dante, Petrarch, and other poets. The *sestina* was a species of verse consisting of six stanzas, each of six lines, in which the rhyming words of the first stanza were carried on through all the others in an inverted order. The opposite of the *sestina* was the *desert*, which was subject to no definite rules as regards either metre, rhyme, or length of stanzas. Some poets even purposely sought after discordance. A distinguished troubadour, Raimbaut de Vaqueiras (1180-1207), in one of his pieces uses five different languages (viz. Provençal, Tuscan, French, Gascon, and Catalan) in five succeeding verses, the sixth being a mixture of all five. The *sonnet* is frequently supposed to have been of Provençal origin. But the only two examples we know of in that language were by an Italian who composed in Provençal, Dante da Majano. The probability is that it was peculiar to the Italians, though doubtless it was the outcome of the influence of Provençal versification. *Sonet* in Provençal is simply identical with *son*, meaning melody.

The two distinguishing characteristics of Provençal versification are the rhyme and the syllabic accent. Some have supposed that in their predilection for rhyme they were influenced by the Moors, but it is more than likely it was natural to the Provençals. The great number of final syllables of the same sound existing in the declensions and conjugations of their language offered great ease of rhyming, and doubtless this had much to do with the formation of their poetry. Owing to their excessive regard for form, there is noticeable in the lyrics of the troubadours a certain sameness or want of variety of sentiment, and a tendency to be artificial rather than natural. Yet the high merit of their poetry must be acknowledged when we consider how rough were the

times in which they lived, and how few literary models they had to guide them. The culture of the Greeks and Romans had long been extinct, and of classical literature they knew nothing, whilst at the time of the highest point of their development the poetry of northern France, of England, of Germany, and of Italy was yet in its infancy.

Rapid as had been the rise of Provençal poetry, as rapid was its decline. What more than anything else was the cause of this decline was the war against the Albigenses (q.v.) in the 13th century, which proved disastrous to the nobles of the south of France. Their lands were laid waste, their castles destroyed. Besides this, with the establishment of the French domination in the south the French language began to be generally used among the upper classes; thus there was no longer any encouragement for the troubadours. Their poetry ceased to be cultivated as formerly. The clergy, too, in their fanatic endeavours to extinguish heresy, destroyed large numbers of Provençal works, and in a bull Pope Innocent IV. styles the Provençal a heretical language, and forbade the use of it to the clergy. With the 13th century the real literary life of the Provençals had disappeared. The two following centuries can only be regarded as an after-period in which the traditions of the troubadours still lingered on. In the first half of the 14th century an effort was made to revive the old poetry. Seven citizens of Toulouse, under the title *La sobregaia companhia dels set trobadors de Tolosa*, established in that city a society of song. Under the auspices of this society were organised *Jeux Floraux*, or poetic contests, at which prizes were given. The activity of the society was not confined to Toulouse; branch societies were formed throughout the south of France, and even in Catalonia and Aragon; but, though it existed for several centuries, this society could never effect what it aimed at—viz. the restoration of the brilliant period of Provençal song. In the 14th and 15th centuries prose works became more numerous. Such were learned treatises— theological, medical, legal, and philological—local chronicles, and pious tales or legends.

During the following three centuries there are almost no Provençal works worthy of notice. In the 19th century, however, a new poetic activity began to manifest itself, commencing with the poet Jaquet Jansemin, or Jasmin (q.v.), and after him Roumanille, the founder of the Society of the *Féliques* (which has in view the preservation of the Provençal language and customs), Mistral (q.v.), a poet of great genius, Aubanel, and others. Poetic festivals, like the *Jeux Floraux*, have also been introduced to aid the movement.

On the subject of the Provençal Language see Diez, *Grammatik der Romanischen Sprachen* (1836 38; 5th ed. 1882); Raynouard, *Lexique Roman* (1838-44), and his *Grammaire comparée des Langues de l'Europe Latine* (1821); Mahn, *Grammatik u. Wörterbuch der Altprovenzalischen Sprache* (1885 et seq.); D. B. Kitchin, *An Introduction to the Study of Provençal* (1887). On the literature see Diez, *Die Poesie der Troubadours* (2d ed. 1853), and *Altromantische Sprachdenkmäler* (1846); Raynouard, *Chant de Peisaces originaux des Troubadours* (1816-21); Fauriel *Histoire de la Littérature Provençale* (1846); Bartsch, *Grundriss zur Geschichte der Provenzalischen Literatur* (1872), and *Chrestomathie Provençale* (4th ed. 1880); Hueffer, *The Troubadours, a History of Provençal Life and Literature* (Lond. 1878); Mahn, *Die Biographie der Troubadours* (2d ed. 1878); Gatiern-Arnould, *Monuments de la Littérature Romaine depuis le 12^{me} Siècle*; Milá y Fontanals, *Los Troubadours en España* (Barcelona, 1861); Paul Meyer, *Les derniers Troubadours*; Lommatzsch, *Provenzalisches Liederbuch* (1917); Émile Ripert, *La Renaissance Provençale* (1918); and books by Rowthorn (1895), Ryhe (Par. 1898), Justin H. Smith (1900), and H. J. Chaytor (1902).

Provence, formerly a maritime province of France, was bounded on the S. by the Mediterranean, and comprised the modern departments of Bouches du Rhône, Var, Basses-Alpes, and parts of Alpes Maritimes and Vaucluse. It included a portion of the Roman province of Gaul generally called simply *Provincia* ('the Province'), whence it derived its name. The Provençal (q.v.) tongue, however, was spoken over a much larger area (see also the section on the language and literature of FRANCE). Provence was overrun in the 5th century by the Visigoths and Burgundians, for a time was under the Saracens, and in 879 was mostly incorporated with Cisjuran Burgundy (q.v.) and with it was attached to Germany. The main part of the region remained, however, under the Counts of Arles, also known as Counts of Provence, and was practically independent. Early in the 12th century the countship passed by inheritance to Raymond Berengar, Count of Barcelona, and under the protection of his successors Provençal poetry attained its zenith. In 1245 the last count died, and the inheritance passed, through his daughter, to her husband Charles of Anjou, who united Provence with Naples. Under the Angevin princes the constitution of Provence, with its three estates holding the power of the purse, was well balanced and free; and it is possible that through Simon de Montfort (q.v.) the English parliamentary constitution may be indebted to it. The last of the counts, Charles, nephew of René the Good (q.v.), died in 1481, and by his will Provence passed to the French crown. It was united with France in 1486.

Several of Dandet's works give vivid pictures of Provençal scenery, life, and character. See also ANJOU, FRANCE, AVIGNON.

Proverbs. All attempts to define a proverb, from the time of Aristotle downwards, have been unsuccessful. One of the difficulties is to find an essential difference that will not admit or exclude too much, and another is the diversity of opinion among paremiographers as to where the line should be drawn. Some would include almost any form of popular phrase, while others, like Gluski, refuse to recognise anything that is not a sentence containing a precept or admonition of some sort. In default of an exact definition we must be content with descriptions, such as Earl Russell's—'The wisdom of many, and the wit of one,' or that of Cervantes—'Short sentences drawn from long experience,' or the more complete if less pithy one of Cipriano de Valera—'Short sayings, sententious and true, and long since accepted as such by common consent.'

But the proverb is not of necessity the *wit* of one. Sometimes it is the simplicity or naïveté of one, and the wit lies in the application of it by the many. The Venetians have a good specimen of this kind. The Emperor Ferdinand, driven for shelter one day into a peasant's house, took a fancy to some dumplings that had been just cooked for the family supper. The court-physician, being responsible for the imperial digestion, remonstrated, but his majesty's gracious answer was 'Kaiser bin i', knödel mus i' haben'—'Emperor I am, dumplings I'll have'—which became in course of time a recognised comment in cases of pertinacity. Here we have what is very rare, a proverb traced to a definite source; a few instances there are, but as a rule the proverb is a scrap of unfathered wit or wisdom that came into the world nobody knows how. Modern society has recourse to proverbs in conversation much more sparingly than was usual in the days of our forefathers, and the reasons are plain enough to see. To accept a proverb as an answer implies deference to authority and in effect an acknowledgment of the wisdom of our

ancestors. In all languages it condemns loquacity and commends silence. It is in fact a primitive

that has not proverbs or rudimentary proverbs of its own, used often to the perplexity of the uninitiated visitor; and what is true of the family is true of the community on a more extensive scale. A man sees another bolting out of his house, and asks what he has been about there. 'You'll see when the eggs come to be fried,' says the other, making off; which is explained when it is time to fry the eggs and it is found that the frying-pan has been stolen. It will be first a family joke; then a parish joke; then a stock saying in the market-place—'very good; time will tell; you'll see when the eggs come to be fried'; then a saying in many market-places; and so at last a proverb. This is the actual story of one enshrined in Don Quixote—*Al freir de los huevos*.

As they pass from the family and the community to the nation, so they pass from one nation to another. The purely national proverbs form only a portion of the proverbs in any language. It almost seems as though there had been from time immemorial a kind of proverb exchange through which any serviceable proverb in one language passed into any other that stood in need of it; and this makes it a matter of difficulty, or rather impossibility, to settle the nationality of many of the best and most familiar. The proverbs that are strictly national have an interest of a special kind. Coming directly from the people, the chosen vehicles of their sentiments and opinions, they naturally reflect the habits of thought, the turn of mind, the way of looking at things, that prevail among those who use them. Any one at all versed in comparative paremiology will be able for the most part to make a shrewd guess at the original language from a translated specimen. They reflect other things too—often the history of the nation they come from. The Spaniard, as he was before Ferdinand and Ximenez bridled Aragon and Castile, makes himself heard in 'The king goes as far as he may, not as far as he would'; there are Teutonic proverbs older than Luther, in which his very spirit seems to speak; there are Italian proverbs that, in their cynicism, distrust of mankind, and open advocacy of lying, are more eloquent on the state of society in medieval Italy than any of her historians. And the differences they suggest are often curious. The devil figures prominently in the proverbs of Europe; but in those of the Latin races he is always treated with respect, or at any rate credited with astuteness, the only exception, perhaps, being the Italian one that accuses him of weaving a coarse web. In Teutonic proverbs, on the other hand, he is held up to ridicule on the score of his amazing simplicity.

Of the national groups the Spanish is unquestionably the most remarkable. A Spanish MS. by Yriarte contained between 25,000 and 30,000. In Spain almost everything has its proverb. And they are as racy as they are numerous, full of shrewd sense and knowledge of human nature, and rich in that grave, dry Spanish humour which never compromises itself by a descent into facetiousness. The Spaniard is, no doubt, naturally sententious, but the facilities offered by his rich, sonorous Castilian should not be overlooked; and among them must be reckoned its wealth in rhymes, consonant and assonant, of which there is such striking proof in the number and excellence of the Spanish rhyming proverbs. Language, it may be observed, plays an important part in proverbs. Take, for example, the Scots 'Better a toom house than an ill tenant.' Compared with the English 'empty,' how much more effective is the Scandinavian 'toom,' to say nothing of the allitera-

tion. The Basque proverbs, from which several of the Spanish are obviously derived, are of much the same character; and in both, but especially in the Basque, the resemblance to the proverbs of the East is very distinct. The Basque proverbs of course form only a small group; but, relatively to population, their numbers indicate a propensity to the use of the proverb as strong as the Spaniards'. The Italian proverbs, only less numerous than the Spanish, are more remarkable for wit, often bitter, than for humour; in the French, on the other hand, there is little or none of that brilliant wit and epigrammatic neatness of expression which distinguish French literature. But this is only what might be expected. French wit is the product of French culture, and proverbs are natural productions. Our own, including the Lowland Scots, must be regarded as simply a subdivision of the great Teutonic group. Next to Spain, the region richest in proverbs in Europe is probably that watered by the lower Elbe, and including Oldenburg, Hanover, Holstein, and Mecklenburg. Compared with other groups, the Celtic proverbs must be rated as poor. Among the oriental proverbs the Arabic hold the first place in respect of quantity, and perhaps quality likewise, but the Persian and Hindustani are also excellent, and in the Turkish, together with abundant worldly shrewdness, there is sometimes a vein of poetry that is very striking. It is questionable whether the 'tender beauty,' to use French's phrase, of our own proverb of the shorn lamb is not rivalled by its Turkish parallel, 'God makes a nest for the blind bird.'

Proverbs. THE BOOK OF, a canonical book of the Old Testament, holds the second place among the Hagiographa, coming immediately after Psalms. The Hebrew word *mishal*, translated in the title by *parabolæ* in the LXX, and *proverbium* in the Vulgate, primarily means 'similitude,' and is applicable to any kind of allegory, simile, or comparison, especially when made for purposes of instruction; and every kind of didactic poetry is also included under the name. Typical instances of the use of the word occur in Ezek. xvii. 2 (LXX, *parabolæ*, R.V. 'parable'), 1 Sam. x. 12 (LXX, *parabolæ*, R.V. 'proverb'), Ps. xlix. 4 ('parable'), Isa. xiv. 4 (LXX *threnos*, R.V. 'parable'); it thus applies equally to that brief spontaneous product of popular wit or wisdom which in ordinary English parlance is most usually understood by the word 'proverb,' and also to that special kind of literary production which the Romans called *sententia*, the Greeks *gnome*, and which is known to the modern French as the *maxime*. The Book of Proverbs as we now have it is made up of a number of originally separate collections; besides the general preface (i. 1-7), usually attributed to the author of chap. i.-ix., it consists of the following eight parts: (1) i. 8-ix. 18 has more appearance of plan, method, and free composition than any of the others, and is especially distinguished by the elaborateness with which its moral lessons are enforced. Its personification of Wisdom as the first creation of God is 'one of the most remarkable and beautiful things in Hebrew literature,' and clearly marks it as belonging to a comparatively late phase of Hebrew thought not far removed from the beginnings of Alexandrian speculation. (2) x. 1-xvii. 16, headed 'the proverbs of Solomon,' consists of 376 miscellaneous distichs, mostly of the antithetic type, of which a good example is furnished by the opening verse of the collection. (3) xvii. 17-xvii. 22 consists of thirty-two moral precepts, six of which are distichs, seventeen in four lines, and the others of various forms, including a discourse or *mishal* of some length against drunkenness (xxiii. 29-35). An exhortation to heedfulness under instruction is prefixed (xxii. 17-21). (4) xxiv. 23-34 is super-

scribed 'These also are sayings of the wise,' and contains six sayings or precepts of a somewhat trite order, including, however, the familiar description of the sluggard and his vineyard. (5) xxv. 1-xxix. 27 has the heading 'These also are proverbs of Solomon, which the men of Hezekiah, king of Judah, copied out.' Of the total number (127) 114 are distichs, six in four lines, and the rest irregular. This collection has often been thought by critics to contain more elements of high antiquity than the rest of the book, and is specially distinguished by the vigour, freshness, and originality of its observations and expressions. (6) xxx. consists of twelve sets of verses of various import, including some riddles of the Hebrew type. The somewhat obscure heading ought probably to run 'The words of Agur the son of Jakeh of Massa' (cf. Gen. xxv. 14; 1 Chron. i. 30), and the opening verses to be read (as in R.V. margin) 'The man said, I have wearied myself, O God, I have wearied myself, O God, and am consumed, for I am more brutish than any man, and have not the understanding of a man—the despairing expression of a spirit that has exhausted its energies in the effort to reach a true knowledge of God. (7) xxxi. 1-9, 'The words of Lemuel, king of Massi (see above), wherewith his mother instructed him,' a warning against wine and women, and an exhortation to righteousness in judgment. (8) xxxi. 10-31, an alphabetical piece without superscription, consisting of twenty-two distichs in praise of the 'virtuous woman'—i.e. the wise, energetic, capable housewife. There are no data that enable us accurately to determine the relative ages of these eight portions. It seems not unreasonable to suppose that the book may have been brought into its present form by the writer of the first part (i. ix.). It is not improbable that the book contains individual utterances of very great antiquity as old as, and perhaps even older than, Solomon himself; but it is impossible to pick out these with certainty. There is no good reason for identifying the main collection (x. 1-xxii. 16), consisting as we have seen of 376 *mishals*, with the 3000 proverbs of Solomon mentioned in 1 Kings. ix. 32, though this has been done by Jerome; that x. 1-xxii. 16 was not before the compilers of xxv. 1-xxix. 27 is evident from the number of doublets contained in the latter series (cf., for example, xxv. 24 and xvi. 9; xxvi. 13 and xxii. 13; xxvi. 15 and xix. 24, and numerous other instances). It is probable that the present book was a slow and gradual growth; and that the process may have been carried on to a very late date is shown by the considerable variations between the Massoretic and Septuagint texts.

For the best account of the Book of Proverbs, with references to the literature of the subject, see C. H. Toy's commentary (Internat. Crit. Comm. Series), and his article in the *Encyclopædia Britannica*; G. C. Martin (*Century Bible*) is concise, but very interesting and useful.

Providence, a seaport and (since 1900 sole) capital of Rhode Island, and one of the great manufacturing centres of the United States, is situated at the head of navigation, on an arm of Narragansett Bay known as Providence River, 35 miles from the ocean and 44 miles by rail SSW. of Boston. It covers an area of over 18 square miles on both sides of the river, which, above its two bridges, expands into a cove, a mile in circuit, on the borders of which is a handsome park, shaded with noble elms. It is a city of large commerce, manufactures, and wealth, abounding with beautiful villas and gardens. Founded before the conventional type of American cities had been discovered, its streets are pleasantly irregular, and the site singularly uneven, rising in one place to

204 feet above high-water; and there are numerous hills and valleys. Among the many notable public buildings and institutions of Providence are a city hall, of granite; facing it the state's soldiers' monument; the state-house; the custom-house and post-office; the Athenæum, and the buildings of the Rhode Island Historical Society; the arcade and the Butler Exchange; a great number of churches, schools, and libraries, hospitals and asylums, including a noble charity known as the Dexter Asylum for the Poor; the Friends' Boarding-school (popularly 'the Quaker College'); and Brown University, a Baptist institution, founded in 1764, and amply endowed: it ranks among the leading colleges of the United States. Providence is a great oil port, and it has become one of the great manufacturing centres of the country; two small rivers afford abundant water-power. The chief establishments are engaged in producing silver-ware, tools, screws, files, stoves, engines, cottons and woollens, &c.; and there are scores of manufactories of jewellery. Providence was settled in 1636 by Roger Williams. Pop. (1870) 68,904; (1880) 104,857; (1890) 132,146; (1900) 175,597; (1910) 224,326; (1920) 237,595; (1925) 267,918.

Province (Lat. *provincia*), a territory acquired by the Romans beyond the limits of Italy, and governed by a Roman Praetor (q.v.) or propretor, or by a procurator (see CONSUL). The senate decided which provinces were to be praetorian and which consular. As a rule the provinces were numerically plundered by the governors and the tax-collectors (*publicani*). Under Augustus there were twelve *imperial* provinces, requiring military occupation, and under the emperor's immediate control, and ten senatorial provinces, entrusted to senatorial management (see ROME). The provinces of France (q.v.) were superseded at the Revolution by the departments. The great governmental divisions of India, Canada, and other countries are often entitled provinces. The sphere of duty of an Archbishop (q.v.) is his province, usually consisting of several dioceses. The monastic orders are or were distributed in provinces of varying area; the *provincial*, in its monastic reference, is the superior of all the houses and all the members of a monastic order within any particular province. See GENERAL, MONACHISM.

Provins, a town of France (dept. Seine-et-Marne), by rail 59 miles S.E. of Paris, has remains of ancient walls, flanked by ruined watch-towers. The most interesting feature is an ancient tower, built in the 12th century, vulgarly called Caesar's Tower. The neighbourhood was long famous for its roses, and they are still cultivated. There are numerous flour-mills. Pop. 9000.

Provisional Order is an order granted, under the powers conferred by an act of parliament, by a department of the government, by the Secretary of State, or by some other authority, whereby certain things are authorised to be done which could be accomplished otherwise only by an act of parliament. The order does not receive effect, however, until it has been confirmed by the legislature. Till that time it is purely provisional; and even after it has been so confirmed and is in reality an independent act, it retains the title of a provisional order. Provisional orders are most useful in facilitating the modification or extension of the provisions of general acts, so as to adapt them to the special necessities of particular districts. They may be obtained with much greater expedition and less cost than a private bill; the confirmatory act when unopposed may be obtained in a week or two, and has all the facilities of a government measure.

Provisions of Oxford. See MONTFORT.

Provisors, STATUTE OF. The object of this statute, passed in the reign of Edward III. (1350), was to correct and put an end to the abuses which had arisen in the exercise of the papal prerogatives as to the disposal of benefices in England. See ENGLAND (CHURCH OF).

Provo, capital of Utah county, Utah, is on the Provo River, between Utah Lake and the Wahsatch Mountains, and 46 miles by rail S.E. of Salt Lake City. It contains a state asylum and a Mormon university. Pop. 10,000.

Provost (Lat. *propositus*, 'set over'), in Church Law, the chief dignity of a cathedral or collegiate church, from which use the title has also been transferred to the heads of other bodies, religious, literary, or administrative. The name is also given to the superiors of certain religious houses of lesser rank, and the relation of which to the more important houses is analogous to that of the priory to the abbey. The head of a cathedral chapter was anciently the archdeacon. At present, in the Roman Catholic Church, cathedral chapters are presided over by provosts in Austria, Prussia, Bavaria, and England, but in other parts of Germany and in France by deans. In the Church of England the Dean (q.v.) is the chief officer of a cathedral; but the title of provost survives, alongside that of dean, in the Scottish Episcopal Church. In the Protestant Church in Germany, in the north especially, where several minor churches or chapels are attached to one chief church, the minister of the latter is called provost (*probst*). In England the heads of Oriel, Queen's, and Worcester colleges in the university of Oxford, and the head of King's College, Cambridge, are designated provost. The head of Eton College is also so called.

In Scotland the chief municipal magistrate of a city or burgh is called provost, the term corresponding to the English word mayor. The provost presides in the civic courts along with the bailies, who are his deputies (see BOROUGH). The provosts of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee, are styled Lord Provost. The Lord Provost of Edinburgh is entitled to the prefix 'Right Honourable,' which may be attached not merely to the name of his office, but to his Christian name and surname. The Lord Provost of Glasgow is also (since 1912) Right Honourable. See ADDRESS (FORMS OF), PRECEDENCE. Within the city and liberties of Edinburgh the Lord Provost takes precedence next after members of the royal family.

Provost-marshal, in the Navy, is a person appointed to have charge of a prisoner before a court-martial, and until the sentence of the court is carried into execution. In the British Army the provost-marshal is an officer, appointed only abroad, to superintend the preservation of order, and to be, as it were, the head of the police of any particular camp or district. He has cognisance of all camp-followers, as well as of members of the army. Under the Army Act of 1881 he cannot as formerly inflict any punishment of his own authority, but may apprehend any offender and bring him before a court-martial. It may then be his duty to see the sentence of the court carried out.

Proxy (contracted for Procuracy), a person who acts as substitute for another for some particular purpose, such as voting at a meeting. Also, the document constituting such relationship. Every member of the House of Lords was formerly permitted to appoint another lord his proxy to vote for him in his absence. Only a spiritual lord could be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer could hold more than two proxies at the same time. Proxies were

never used in judicial business, or in committees of the House, nor could a proxy sign a protest. The practice of admitting proxies in the House of Lords was discontinued in 1868. Shareholders in joint-stock companies may vote by proxy. Formerly princely persons were sometimes, for reasons of state or convenience, represented by deputy at their own marriages; but marriage by proxy is not recognised by the law of England. See MATRIMONY.

Prudentius, MARCUS AURELIUS CLEMENS, the most important of the Roman Christian poets, was born in the north of Spain in 348 A.D. Nothing is known regarding him except what he has himself told in a poetical autobiography prefixed to his works. From this we learn that he received a liberal education, practised as a pleader, discharged the functions of civil and criminal judge, and was ultimately appointed to a high office at the imperial court. His religious convictions came late in life, and he devoted the evening of his days to the composition of religious poetry. The year of his death is not known. Of his poems the chief are (1) *Cathemerinon Liber*, a series of twelve hortatory hymns, the first half for the different hours of the day, the latter half for different church seasons (Eng. trans. 1845); (2) *Peristephanon*, a collection of fourteen lyrical poems in honour of martyrs; (3) *Apotheosis*, a defence of the doctrine of the Trinity against heretics; (4) *Hamartigenia*, on the Origin of Evil, a polemic, in verse, against the Marcionites; (5) *Psychomachia*, on the Triumph of the Christian Graces in the Soul of a Believer; (6) *Contra Symmachum*, the first book a polemic against the heathen gods, the second against a petition of Symmachus for the restoration of the altar and statue of Victory cast down by Gratian; (7) *Diptychon*, a series of forty-nine hexameters, arranged in four verses, on scriptural incidents and personages. Bentley calls Prudentius 'the Horace and Virgil of the Christians,' which may be true enough if the critic only meant to say that he is the first of the early Christian verse-makers. See the article HYMN.

Editions are by F. Areal (Rome, 1788), reprinted in Migne's *Patrologia*, lix.-lx.; Olbar (Tubingen, 1845); and Dressel (Leip. 1860). See Brockhaus, *A. Prudentius* (1872); Ebert, *Geschichte der Christlich-Lat. Lit.* (vol. i. 1874); Faguet, *De A. Prudentii Clementis Carminibus* (1883); and F. St John Thackeray, *Translations from Prudentius* (1890), with an excellent introduction on his life and times, metre, and style. See also Dr Buge's *Wayside Sketches* (1906).

Prud'hommes, COUNCILS OF. See FRANCE.

Prunella, or BRUNELLA, a genus of Labiate. Several species are natives of Europe; one only is found in Britain, *P. vulgaris*, popularly known as Self-heal, a plant very frequent in moist and barren pastures, as it is also throughout most parts of Europe, central Asia, North America, and Australia—once in repute as a febrifuge.

Prunes are dried fruit of the plum-tree (*Prunus domestica*), largely prepared in France, and exported thence. Great numbers come also from Bosnia, Serbia, Italy, California, and Japan; the 'Kelsey' plum producing larger and finer prunes than even the famous Agen plum of the south of France.

Pruning, the removal of branches from trees, in order to the greater production of fruit, the improvement of timber, or purposes of ornament. Some trees will bear clipping which would be utterly destructive of others. Fantastic forms, once esteemed as the finest ornaments of a pleasure-ground are rejected by the simpler taste of the present age, and the 'topiarian art' has few admirers. Much may be done however, by the removal of branches to give a finer form to ornamental trees; but in

this, as in the pruning of trees grown for the sake of their timber, a great mistake is very generally committed in permitting branches to grow to a considerable size before they are cut off. It may be accepted as a general rule that the branches removed should be small in proportion to the bulk of the trunk. The removal of twigs and small branches is attended by no bad effects, and may be beneficial; but the removal of large branches is dangerous. The leaving of stumps or snags is an aggravation of the evil. They rot away and spoil the timber of the stem; indeed, a hole is not unfrequently formed, which may eventually lead to the rotting of the whole of the interior of the trunk of the largest oak. But in the case of forest trees pruning may with advantage be in great part avoided, by taking care to plant at proper distances, and thinning out the plantations sufficiently in early periods of their growth. In this way better timber is obtained and a greater produce from the land. Pines and firs scarcely ever require pruning, and are probably in almost all cases the worse of that which they get, except in the removal of those lower branches which have actually begun to decay. In other trees it is sometimes of importance to watch for branches that would divide the trunk, and to prevent the division, causing the main stem to ascend higher before it forms a crown; but to be of any use this must be done whilst the branches are still very young. Plantations should therefore be examined with a view to pruning, at intervals of not more than two years, after they are six or eight years old.

In orchards and fruit-gardens pruning is necessary, the object being not to produce timber, or the utmost luxuriance of trees, but fruit in the greatest perfection and abundance. The habits of each kind must be studied. Even in the pruning of gooseberry and currant bushes regard must be had to natural diversities, the gooseberry and black-currant producing fruit chiefly on young wood, whilst the red and white currant produce fruit chiefly on spurs from older branches. And so it is amongst trees; apricots, for example, producing fruit chiefly on young wood, cherries mostly on spurs, whilst plums produce both in the one way and in the other. The object of the gardener in pruning is to bring the tree into the condition best suited for producing fine fruit and in the greatest abundance; and to this the training of wall trees must also be accommodated. Sometimes, in order to produce particularly fine fruits for special purposes, the gardener diminishes the number of branches likely to bear fruit beyond what would otherwise be desirable. The Lorette system seeks to promote fruit-bud development at the expense of shoots in fruit trees by a special form of pruning in June or July. The general seasons of pruning are winter and spring; but some trees, particularly cherries and all other drupeaceous fruit trees, are advantageously pruned in summer, as they then throw out less gum.

Pruning instruments are of various kinds—knives, axes, saws, bills of very various forms, &c.; and the misnamed *averruncator*, which may be described as a pair of scissors, one blade hooked or crooked, attached to a long handle, and working by a cord and pulley. It is scarcely used except for standard trees in gardens and orchards.

Prunus. See PLUM, CHERRY, APRICOT, &c.

Prurigo is the name applied to a group of diseases of the skin, characterised by the presence of papules, scarcely distinguishable in colour from the normal skin, and so felt rather than seen, accompanied by intense itching. One form of the disease, *prurigo scabiei*, is met with in old people. Another form set up by the irritation of lice dis-

appears when these are removed. In its most characteristic form, however, it almost always begins in childhood, and may persist through life: even when it is got rid of for a time it is very apt to recur. It chiefly affects the trunk and extensor surfaces of the limbs, and is worse in winter. The disease is aggravated by the scratching from which the sufferer cannot refrain, and the skin becomes thickened and often eczematous as well. Warm baths and soothing ointments externally, good feeding, cod-liver oil, and arsenic or quinine are generally found to give great relief, and often cure the disease entirely.

Prussia (*Preistaut Preussen*), by far the largest and most important state in the German Reich, is a republic embracing nearly the whole of northern Germany. Prussia includes moreover Hohenzollern (q.v.) and some smaller exclaves or detached territories lying within the bounds of other German states. The area, without the temporarily severed Saar region (see RHEINLAND), is 113,109 sq. m., with (1925) 38,170,633 inhabitants—so that the state comprises nearly two-thirds of the entire German Reich, with over three-fifths of the population; and in area is about equal to the state of Arizona, or somewhat less than Great Britain and Ireland. The following are the provinces into which Prussia is divided:

	Pop in 1919.	Pop in 1925.
East Prussia (Ostpreussen)	2,227,826	2,274,152
Brandenburg	2,445,627	2,613,507
Berlin	3,303,770	3,934,971
Pomerania (Pommern)	1,789,216	1,920,196
Grenzmark	324,796	347,319
Lower Silesia (Niederschlesien)	2,988,613	3,158,983
Upper Silesia (Oberschlesien)	1,299,672	1,372,203
Prussian Saxony (Provinz Sachsen)	3,129,193	3,281,293
Sleswick-Holstein (Schleswig-Holstein)	1,492,698	1,535,588
Hanover (Hannover)	3,027,864	3,211,205
Westphalia (Westfalen)	4,491,507	4,826,885
Hesse-Nassau (Hessen-Nassau)	2,273,502	2,403,792
Rheinland	6,769,831	7,282,671
Hohenzollern	70,751	72,368
Total *	36,100,236	38,170,633

* Not including the Prussian part of the Saar Territory, which in 1925 had 622,418 inhabitants

Omitting Berlin, the density of population ranges between 113.5 (Grenzmark) and 763.4 (Rheinland) per sq. m. The Prussia of Frederick the Great embraced only 47,800 sq. m. when he ascended the throne, and 75,000 when he died. In the latter half of the 19th century Prussia increased in area by about one-fourth, the greatest gains being after the victorious war of 1866. By the Great War she lost over 20,000 sq. m. In 1819 the population was 10,981,934; in 1864, 19,254,649; in 1871, 24,689,252; in 1895, 31,855,123; in 1910, 35,000,493.

PHYSICAL FEATURES. *Mountains.*—The greater part of Prussia belongs to the north European plain, while only about a third, chiefly in the south-west, can be described as hilly or mountainous. The division line between the two districts is roughly indicated by an irregular series of heights beginning with the Teutoburgerwald, to the east of the upper Ems, and the Weser Hills, on both sides of the upper Weser, and thence running towards the south-east in the Harz Mountains (q.v.), with the Brocken (3740 feet), and in the northern outliers of the Thuringerwald (Finsterberg, 3100 feet; Inselsberg, 3000 feet). Farther to the south-east this line of heights is continued by the Riesengebirge (q.v.), separating Prussian Silesia from Bohemia, and forming the northern ranges of the Sudetic system. None of these ranges rise above about 5000 feet; the Schneekoppe (5250 feet) in the Riesengebirge is the loftiest summit on Prussian territory. The western and south-western parts of the country, comprising Rheinland, Westphalia, and Hesse-Nassau, thus cut off from the sandy and heathy wastes of the north, are quite distinct in

their physical character from the rest of Prussia. They are divided by the Rhine into two portions. On the west side of the river, between Aachen and the Moselle, is the elevated plain known as the Hohes Venn (now partly in Belgium) and the Eifel, which has a mean elevation of 1600 feet, with a few higher hills (Hohe Acht, 2490 feet). South of the Moselle, and parallel with that river, stretches the Hunsrück, with an average height of 1200 to 1500 feet, and farther south is the Hardt, the northern extremity of the Vosges. On the east side of the Rhine the Sauerland, between the Ruhr and the Sieg, with the Rothaar or Rotlagergebirge, is succeeded farther south by the Westerwald (Fuchskanten, 2155 feet), between the Sieg and the Lahn, and by the Tannus (Feldberg, 2885 feet), between the Lahn and the Main. To the south of the Tannus, famous for its mineral springs, lies the fertile valley of the Main, while to the east the Vogelsberg, chiefly, however, in Hesse, forms a link with the Hohe Rhön (Wasserkuppe, 3115 feet), which may be regarded as an outlier of the Thuringerwald. The soil is generally poor in these districts, though they possess special sources of wealth in their iron and coal mines. The level country between the Rhine and the Maas, bordering the Eifel, is, however, extremely fertile; and Hesse-Cassel is particularly fruitful, cereals of all kinds growing abundantly. The great northern plain, which occupies the rest of the state, is varied by two terrace-like elevations already described under GERMANY. The surface is diversified with numerous lakes, especially in the east, on what are known as the Pomeranian and East Prussian Lake-plateaus. The soil, consisting chiefly of loose sand interspersed with a large number of erratic blocks of granite, is sterile, covered in many places with heaths and belts of stunted pines. On the northern slope, terminating on the shores of the Baltic, there are several fertile districts, more especially along those rivers which have been carefully embanked. The southern elevation of the Prussian plain, running between Poland in the south-east and the Elbe between Magdeburg and Burg in the north-west, attains a height of about 1000 feet near Breslau on the Oder, where it is known as the Trebnitz Heights. Its general character is more fertile than the northern elevation; while the country between the two is, for the most part, extremely sterile. It includes the sandy waste in which Berlin, the capital, is situated. South of this tract, and in Silesia and Prussian Saxony, the country is fertile, including some of the most productive grain-growing districts of Prussia. Hanover has much the same character. Great marshes or peat-moors cover the north and north-west districts; but the valleys that lie among the Harz Mountains in the south are often fertile, and well adapted for agriculture. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dykes. Sleswick-Holstein, to the north of the Elbe, is in part sandy and heathy, like the plain of Hanover, but it has also numerous marshes.

Rivers.—The northern plain is watered by five large rivers—the Niemen, Visla, Oder, Elbe, and Weser—all of which rise beyond the borders of the state, and the Pregel, Eider, and Ems, which are exclusively Prussian. In the west the chief river is the Rhine, which enters Prussia at Mainz, and thence flows north through a narrow valley noted as one of the most picturesque parts of Germany. The Rhine, which is navigable throughout its entire course in Prussian territory, receives numerous tributaries—as the Lahn, Wied, Sieg, Wupper, Ruhr, Lippe, Beck, and Vechte, on the right, and on the left the Ahr and the Moselle or Mosel, the latter of which is navigable for more

than 150 miles within the Prussian dominions. The *Weser*, *Elbe*, *Oder*, and *Vistula*, as also the *Spree* and *Havel*, affluents of the *Elbe*, are, with their canals, of high importance for the inland navigation of Prussia, and are discussed in special articles.

Climate.—The climate of Prussia presents great differences in the eastern and western provinces, the former being exposed to heavy snowstorms in winter and great drought in summer, while the latter have milder winters and a greater rainfall. At Berlin the annual mean temperature is 48° F.; on the Rhine it is 49° (summer, 63°; winter, 34°); in the east provinces and among the mountains it is below 43° (summer, 61°; winter, 25°).

Productions.—Agriculture and the rearing of cattle constitute the principal sources of employment and wealth of the rural population of Prussia, and the state has directed unremitting attention to the furtherance of the one and the improvement of the other. Rye, wheat, oats, barley, peas, millet, rape seed, linseed, beet-root, potatoes, tobacco, flax, hemp, hops, chicory are extensively cultivated. The finest grain districts are the Börde, near Magdeburg, the low lands on the *Wurthe* and *Netze*, and on the *Płonie* and *Małne* lakes, the north-eastern parts of Pomerania, the island of *Rügen*, the valleys of the *Oder* in Silesia, of the *Saale*, *Moselle*, *Saar*, and parts of *Hesse-Nassau*. Magdeburg is the centre of the beet-root sugar industry. Western Prussia is noted for its excellent fruits and vegetables, and its provinces stand pre-eminent for their wines. Nassau is specially famous for its Rhine wines. The forest-lands, which are chiefly in East Prussia, Upper Silesia, Westphalia, Southern Hanover, and Hesse-Nassau, are of great value and considerable extent. The mineral products of Prussia include coal, iron, lead, zinc, copper, cobalt, antimony, manganese, arsenic, sulphur, alum, nickel, black lead, baryta, gypsum, slate, lime, freestone, salt, amber, agate, jasper, onyx, &c. The chief coalfields are in Silesia, Westphalia, and Rheinland, which are at the same time the chief industrial provinces. The region of the Harz in Hanover is also famous for its mining industries. Of mineral springs the most noted and efficient are the sulphur baths of Aachen and Ems, the iron springs of Schwabach, Wilhelmshad, Driburg, and the hot and saline baths of Reinerz, Landeck, Flinsberg, Freienwalde, Lanchstidt, Wiesbaden, Schlungenbad, and Selters. East Prussia is noted for its excellent breed of horses. Westphalia enjoys a special reputation for its ham and pork, Pomerania for its smoked geese, and Brandenburg and Hanover for honey and wax. Fish of all sorts are abundant in the rivers and numerous lakes; seals are taken in the Baltic. The wooded districts abound in game of every kind, partridges and wild geese being often found in enormous quantities. Besides stags, fallow-deer, wild boars, foxes, otters, weasels, polecats, martens, badgers, hares, and rabbits, the bear and beaver are occasionally met with, as is the eagle.

Manufactures.—The principal manufactures are linens, for which certain districts of Silesia, Prussian Saxony, and Brandenburg enjoy a European celebrity; while the newer cotton industry has maintained a successful rivalry with the older linens. Besides these there are numerous manufacturing of silk, wool, mixed cotton and linen fabrics; including fine shawls and carpets in Brandenburg, stockings and ribbons in Rheinland, where, as well as in Westphalia and Hesse-Nassau, the flax, hemp, and silk and cotton thread is mainly prepared for the manufacturers. These districts, moreover, stand foremost in regard to the preparation and manufacture of iron, steel (the works of Krupp at Essen, being world-famous), and other metallic wares, paper, leather, soap, oil, cigars,

and tobacco, and for the number of their distilleries and breweries; while Saxony and Silesia have the largest number of chicory, starch, beet-root, gunpowder, and glass works.

Commerce.—The commerce of Prussia is materially facilitated by her central European position, and the network of river and canal navigation, which makes her territories the connecting medium between several of the great European states, and which, with 20,000 miles of railway, a great system of public roads (all, or nearly all, formed since the time of Frederick the Great), and a coast-line on two seas, gives her a free outlet to the rest of the world. The chief ports are Pillan, Königsberg, Kolberg, Swinemünde, Stettin, Wolgast, Stralsund, Kiel, Flensburg, Altona, Harburg, Geestmünde, Leer, and Emden. The principal commercial towns are Berlin, Königsberg, Breslau, Barmen, Elberfeld, Stettin, Cologne (Cöln), Magdeburg, Aachen, and Frankfurt-on-the-Main. Annual fairs are held at Breslau, Magdeburg, the two Frankfurts, Cologne, and Königsberg.

Religion.—Two-thirds of the people are Protestants. The districts lost by the Great War were mainly Catholic. Since 1817 the Lutheran and Reformed Churches have been united. There is no state church.

Education. Education is compulsory in Prussia between the ages of six and fourteen, and its management and direction are under the control of the state. In no country are better or ampler means supplied for the diffusion of knowledge among all classes of the community. Prussia has twelve universities—viz. Königsberg, Berlin, Greifswald, Breslau, Halle, Göttingen, Münster, Bonn, Kiel, Marburg, Frankfurt-on-the-Main, and Cologne. See GERMANY. In addition to the libraries of the several universities there is the Landesbibliothek, formerly the Royal Library, at Berlin. See LIBRARY.

Constitution.—Prussia was an absolute monarchy till the crisis of 1848, when the decided movement in favour of liberal views compelled the king to convoke a national assembly, and submit to the establishment of a constitutional form of government, which was repeatedly modified. A republic was proclaimed 13th November 1918. Under the constitution of 30th November 1920 the Landtag is elected for four years on the principle of proportional representation by equal secret and direct vote of citizens (male and female) of twenty years of age. The Landtag elects the minister president, and the ministry chosen by him is at the head of the government. The provincial diets elect the Staatsrat. Its veto can be annulled by a two-thirds majority of the Landtag, or by a simple majority of the people voting on the initiative of the Landtag. Initiative of the people may be exercised on demand of one-twentieth of the electors, or, for an amendment of the constitution, one-fifth.

History.—The lands bounded by the Baltic, which now form East Prussia, were early occupied by a people speaking Old Prussian, a tongue belonging not to the Germanic family but to the Baltic, nearly allied to Lettish and Lithuanian. Beyond the fact of their having come into temporary conflict with the Goths and other Teutonic hordes prior to the great exodus of the latter from their northern homes, little is known of the people till the 10th century, when they first appear in history under the name of Borani, or Prussians. In 997 Bishop Adalbert of Prague suffered martyrdom at their hands while endeavouring to convert them to Christianity. Boleslas, Duke of Poland, succeeded, however, about 1018, in compelling them to submit to baptism and subjection. After many futile attempts on the part of the people

to throw off the yoke of Christianity and foreign domination, they finally made a successful stand against Boleslas IV. of Poland in 1161, and for a time maintained a rude and savage kind of independence, which the disturbed condition of Poland prevented its rulers from breaking down. The fear of losing their freedom if they adopted Christianity made the Prussians obstinately resist every effort for their conversion: and it was not till the middle of the 13th century, when the knights of the Teutonic order began their famous crusade against them (see TEUTONIC KNIGHTS), that the Christian faith was established among them. The inroads of the pagan Prussians on the territories of their Christian neighbours, and their advance into Pomerania, were the exciting causes of this important movement. The knights of the order, when appealed to by Conrad, Duke of Masovia, to aid in the subjection of the heathen, gladly promised their services on condition of being permitted to retain possession of the lands which they might conquer; and, having entered the Prussian territories in considerable numbers, they entrenched themselves in Vogelsang and Nesselau in 1230, and at once entered upon the conquest of Prussia. For half a century the belligerent brotherhood were engaged in war with the people—winning lands and souls by hard fighting—until at length in 1283 they found themselves undisputed masters of the country, which they had both civilised and Christianised after a fashion—that is to say, by almost exterminating the pagan population. During this period of struggle the knights founded the cities of Thorn, Kulm, Marienwerder, Memel, and Königsberg, repopulated the country with German colonists, encouraged agriculture and trade, and laid the foundation of a well-ordered, prosperous state. The unhappy wars between the knights and the Poles and Lithuanians, together with the moral degeneracy of the order, led, in the 14th and 15th centuries, to the gradual decline of their supremacy. In 1454 the municipal and noble classes, with the co-operation of Poland, rose in open rebellion against the knights, who were finally compelled to seek peace at any cost, and obliged in 1466 to accept the terms offered to them by the treaty of Thorn, by which West Prussia and Ermland were ceded by them unconditionally to Poland, and the remainder of their territories declared to be fiefs of that kingdom. In 1511 the knights elected as their grand-master the Markgraf Albert of Anspach and Baireuth, a kinsman of the king of Poland, and a scion of the Frankish line of the Hohenzollern family. Although his election did not immediately result, as the knights had hoped, in securing them allies powerful enough to aid them in emancipating themselves from Polish domination, it was fraught with important consequences to Germany at large, no less than to the order itself. In 1525 the grand-master was acknowledged Duke of Prussia, which was converted into a secular duchy (afterwards known as East Prussia), and renounced the Roman Catholic religion for Lutheranism, his example being followed by many of the knights. The country made rapid advances under the rule of Albert, who improved the mode of administering the law, restored some order to the finances of the state, established schools, founded the university of Königsberg (1544), and caused the Bible to be translated into Polish, and several books of instruction to be printed in German, Polish, and Lithuanian. His son and successor, Albert Frederick, having become insane, a regency was appointed. Several of his kinsmen in turn enjoyed the dignity of regent, and finally his son-in-law, Johann Sigismund, elector of Brandenburg, after having held the administration of affairs in his hands for some

years, was, on the death of the duke in 1618, recognised as his successor, both by the people and by the king of Poland, from whom he received the investiture of the duchy of Prussia. From that period to 1918, Prussia was governed by the Hohenzollern-Brandenburg House.

Here it will be necessary to retrace our steps in order briefly to consider the political and dynastic relations of the other parts of the Prussian state. In 1134 the North Mark, afterwards called the Altmark, a district west of the Elbe and north-east of the Harz, was bestowed upon Albert the Bear of Luxemburg, who extended his dominion over the marshy region near Brandenburg and Berlin (the Mittelmark), and assumed the title of markgraf of Brandenburg. During the next two or three centuries his immediate descendants advanced still farther eastward, beyond the Oder into Further Pomerania. On the extinction of this line, known as the Ascanian House, in 1319, a century of strife and disorder followed, until finally Frederick VI., count of Hohenzollern, and markgraf of Nurnberg, became possessed, partly by purchase and partly by investiture from the Emperor Sigismund, of the Brandenburg lands, which, in his favour, were constituted into an electorate. This prince, known as the Elector Frederick I., received his investiture in 1417. He united under his rule, in addition to his hereditary Franconian lands of Anspach and Baireuth, a territory of more than 11,000 sq. m. His reign was disturbed by the insubordination of the nobles, and the constant incursions of his Prussian and Polish neighbours, but by his firmness and resolution he restored order at home and enlarged his boundaries. Under Frederick's successors the Brandenburg territory was augmented by the addition of many new acquisitions, although the system of granting appanages to the younger members of the reigning house, common at that time, deprived the electorate of some of its original domains. The *Despositio Achilica*, however, which came into operation on the death of the Elector Albert Achilles (1470-86), while it separated Anspach and Brandenburg, legally established the principle of primogeniture in both. The most considerable addition to the electorate was the one to which reference has already been made, and which fell to the Elector John Sigismund through his marriage in 1609 with Anne, daughter and heiress of Albert Frederick the Insane, Duke of Prussia. In consequence of this alliance the duchy of Cleves, the countships of Ravensberg, the Mark, and Limburg, and the extensive duchy of Prussia, now known as East Prussia, became incorporated with the Brandenburg territories, which were thus more than doubled in area.

The reign of John Sigismund's successor, George-William (1619-40), was distracted by the miseries of the Thirty Years' War, and the country was alternately the prey of Swedish and imperial armies; and on the accession of George-William's son, Frederick-William (q.v.), the 'Great Elector,' in 1640, the electorate was sunk in the lowest depths of social misery and financial embarrassment. But so wise, prudent, and vigorous was the government of this prince that at his death in 1688 he left a well-filled exchequer, and a fairly-equipped army of 38,000 men; while the electorate, which now possessed a population of one and a half million and an area of 43,000 sq. m., had been raised by his genius to the rank of a great European power. His successors Frederick I. (q.v.; 1688-1713) and Frederick-William I. (1713-40) each in his own way increased the power and credit of Prussia, which had been in 1701 raised to the rank of a kingdom. The latter monarch was distinguished for his rigid economy of the public

money and an extraordinary penchant for tall soldiers, and left to his son Frederick II. (q.v.), Frederick the Great, a compact and prosperous state, a well-disciplined army, and a sum of nearly nine million thalers in his treasury. Frederick II. (1740-86) dexterously availed himself of the extraordinary advantages of his position to raise Prussia to the rank of one of the great political powers of Europe. In the intervals between his great wars he devoted all his energies to the improvement of the state, by encouraging agriculture, trade, and commerce, and reorganising the military, financial, and judicial departments of the state. By his liberal views in regard to religion, science, and government, he inaugurated a system whose results *reacted on the whole of Europe; and in Germany more especially he gave a new stimulus to thought, and roused the dormant patriotism of the people.* Frederick was not over-scrupulous in his means of enlarging his dominions, as he proved by sharing in the first partition of Poland in 1772, when he obtained as his portion nearly all West Prussia and several other districts in East Prussia. His nephew and successor, Frederick-William II. (1786-97), aggrandised his kingdom by the second and third partitions of Poland in 1793 and 1795. Frederick-William III. (q.v.; 1797-1840), who had been educated under the direction of his grandfather, Frederick the Great, succeeded his father in 1797, at a time of extreme difficulty, when continental rulers had no choice beyond being the opponents, the tools, or the victims of French republican ambition. By endeavouring to maintain a neutral attitude Prussia lost her political importance, and gained no real friends, but many covert enemies. But the calamities which this line of policy brought upon Prussia roused Frederick-William from his apathy, and, with energy, perseverance, and self-denial worthy of all praise, he devoted himself, with his great minister Stein, seconded by Count Hardenberg, to the reorganisation of the state. In the years 1806-10 Prussia underwent a complete domestic reorganisation; and after the battle of Waterloo, which restored to Prussia much of the territory lost at the peace of Tilsit in 1807, the career of progress was continued. Trade received a new impulse through the various commercial treaties made with the maritime nations of the world, the formation of excellent roads, the establishment of steam and sailing packets on the great rivers, and at a later period through the organisation of the Zollverein (q.v.), and through the formation of railways. The most ample and liberal provision was made for the diffusion of education over every part of the kingdom, and to every class. In like manner, the established Protestant Church was enriched by the newly-inaugurated system of government subvention, churches were built, the emoluments of the clergy were raised, and their dwellings improved; but, not content with that, the king forcibly united the Lutheran and Reformed Churches in 1817, a high-handed act most fruitful in discontent and difficulties. This tendency to over-legislation was long the predominating evil feature of Prussian administration; and the state, without regard to the incongruous elements of which it was composed, was divided and subdivided into governmental departments, which in their turn, under some head or other, brought every individual act under governmental supervision, to the utter annihilation of political independence. The people soon perceived that this administrative machinery made no provision for political and civil liberty, and demanded of the king the fulfilment of the promise he had given in 1815 of establishing a representative constitution for the whole kingdom. This demand was not acceded to by the king, and its immediate fruits were strenuous

efforts on his part to check the spirit of liberalism. Siding with the pietists of Germany, he introduced a sort of Jesuitical despotism, which was continued by his successor, Frederick-William IV. The Landstände or provincial estates, organised in accordance with the system of the middle ages, were the sole and inadequate mode of representation granted to Prussia in this reign, notwithstanding the pledge made to the nation for a full and general representative government. The accession of Frederick-William IV. (1840-61) seemed to open a better prospect to the friends of constitutional freedom. A political amnesty was proclaimed, religious toleration was announced, and a contest betwixt the crown and the pope, in which the first signs of the coming Kulturkampf may be traced, was brought to a close by concessions on the part of the king. Frederick-William, however, was an enthusiastic upholder of the divine right of kings, and it soon became apparent that he was in no way prepared to follow up his vague promises of political liberty by sharing political power with the people. The bureaucratic spirit of over-governing became daily more and more irksome to the nation, and it was evident that a constitutional struggle was inevitable. The king and his advisers, underrating the importance of the movement of 1848 in Germany, thought they had satisfied the requirements of the hour by granting a few unimportant reforms and by making equivocal promises of future concessions. A collision betwixt the troops and the citizens of Berlin, in which blood was shed, awoke the king to the full gravity of the crisis, and he hastened to allay the general discontent by the nomination of a liberal ministry, the recognition of a civic guard, and the summoning of a representative chamber to discuss the proposed constitution. The conversion of the monarch to liberalism was but temporary; and although, after much obstruction, a constitution, superseding the old Prussian estates by a representative parliament, was promulgated in January 1850, it was repeatedly modified in the following years, until few of its democratic features were left. Frederick-William had early distinguished himself and delighted many Germans, both within and without Prussia, by his patriotic utterances in favour of a new united Germany. He was deeply chagrined when in 1848 the national assembly at Frankfurt, influenced by Austrian jealousy of the military strength of Prussia, declined to accept him as the national leader, and elected instead the Archduke John of Austria as lieutenant-general of Germany. Yet, when in the following year he was offered the imperial crown, he found himself unable to face the responsibility of accepting it. He hesitated to make so important a move in the contest with Austria for the hegemony of Germany. The later years of his reign were characterised by great advances in the material prosperity and internal improvement of the country. Extensive lines of railway and post-roads were opened, the river navigation greatly facilitated, treaties of commerce formed with foreign countries, and great expatriation given to the Prussian and North German Zollverein (q.v.), the army put upon a footing of hitherto unprecedented efficiency of arms and artillery, and the educational system of the country still further developed. William I. (1861-88), who became German emperor in 1871, had been regent of the kingdom since 1858, owing to the insanity of his brother, the late king. William was no more a lover of constitutional, or at least of popular, liberty than any of his predecessors; and in his opposition to the progress of the popular movement, in so far as it aimed at interference with the royal power, he was powerfully aided by his great adviser Bismarck (q.v.), who became prime-minister

in 1862 and imperial chancellor in 1871. The successful wars with Austria (1866) and France (1870-71), which so enhanced the prestige of Prussia and which resulted in the united Germany of to-day, are described at GERMANY. Since the king of Prussia became German emperor the history of Prussia has been practically merged in the history of Germany. After the brief reign of Frederick III. (March 9 to June 15, 1888), his son, William II. (q.v.) ascended the throne. Prince Bismarck resigned all his ministerial functions in March 1890, as well in the kingdom as in the empire; and no subsequent Prussian minister has since exercised his predominant powers. Adhering to the military policy of his grandfather, and cherishing a more or less exalted belief in the divine right of kings, William II., by his unguarded and theatrical speeches, became an embarrassment to his people, and for its adversaries a symbol of militarism. He abdicated in November 1918, and Prussia was declared a republic. The loss of the Great War freed Prussia from the Hohenzollerns and from Junker rule, but it cost her much territory. Except Alsace-Lorraine, all the lands lost to the Reich were Prussian. Posen and West Prussia were almost wholly lost, and their remnants formed into the Grenzmark. For details, see articles on the various provinces. Since the setting-up of the republic there have been movements in favour of separating various provinces from the state, but these have completely failed. On the other hand, Pymont was by plebiscite detached from Waldeck in 1922, and became part of Prussia.

See, besides works cited at GERMANY, BERLIN, FREDERICK II., BISMARCK, &c., II. Tuttle, *History of Prussia* (Boston, 1884-88); Godefroy de Cavaignac, *Les Origines de la Prusse Contemporaine* (1890); Marriott and Robertson, *The Evolution of Prussia* (1915); Prutz, *Preussische Geschichte* (1900 et seq.).

Prussia, EAST, the north-easternmost province of Prussia and of Germany, now separated geographically from the rest of the Reich by the corridor to the Baltic, given to Poland by the Treaty of Versailles. The same treaty detached the north-eastern corner (see LITHUANIA, MEMEL), and a small area around Soldau in the south-west (now Polish). It provided for a plebiscite in the Masurian district of Allenstein, which, by an almost unanimous vote, decided in 1921 to remain German. The adjoining West Prussian districts, cut off by the Polish corridor, have been added to East Prussia. The province thus stretches from the Niemen to the Vistula, and includes the basin of the Pregel. It is low, with many lakes, of which Spirdingsee is the greatest. Two of the great lagoons of the Baltic are mostly within its bounds, Kurisches Haff and Frisches Haff. The capital is Königsberg. For history see PRUSSIA. Pop. (1925) 2,274,152.

Prussia, WEST, till 1919 a province of Prussia, whose expansion had made its name a misnomer. The Treaty of Versailles gave most of it to Poland (see POMORZE); made its capital (Danzig) a free state; and provided for a plebiscite in the Marienwerder district, which voted overwhelmingly for Germany. The eastern remnant (the plebiscite area and the country about Elbing) thereafter became part of East Prussia, and the western was combined with what was left of Posen (see GRENZMARK).

Prussian Blue, the name given to sesquiferrocyanide of iron, used as a colouring matter. It was discovered in 1704 by Diesbach in Berlin (whence it is also called Berlin Blue), and the manufacture was kept a secret till 1724. See BLUE; also DYEING.

Prussic Acid, a name given to Hydrocyanic Acid (q.v.) because it was first obtained from Prussian blue.

Prutenic Tables, astronomical tables compiled in the 16th century, and so called because based on the system of Copernicus, a Prussian. They were corrected by Brahe.

Prunth, a left-hand affluent of the Danube, rises in the south-east of Galicia, on the north-east side of the Carpathian mountains, and flows eastward past Kolomea and Czernowitz; from the point at which it leaves Bukovina to its embouchure in the Danube at Reni, 13 miles below Galatz, it forms the boundary between Bessarabia and Moldavia. Length about 520 miles, navigable from near Jassy, 168 miles.

Prynne, WILLIAM, born in 1600 at Swainswick near Bath, from Bath grammar-school passed in 1616 to Oriel College, Oxford, and took his B.A. in 1621. He entered Lincoln's Inn, and in due time was called to the bar, but was early drawn into the vortex of ecclesiastical controversy, and during 1627-30 published *The Unlearnedness of Love-tokes, Healths Sicknesses* (against drinking of healths), and three other Puritan and anti-Arminian diatribes. In 1633 appeared his *Histrio-Mastix: the Players Scourge*, in whose index, on page 1104, occur the words 'Women players notorious —'. Six weeks after its publication Henrietta Maria herself took part in a pastoral, so here was a reflection on the queen's own virtue; and on 17th February 1634 Prynne was sentenced by the Star-chamber to a fine of £5000, degradation from the bar, expulsion from Oxford and Lincoln's Inn, the loss of both ears in the pillory, and the shock to his vanity as an author of seeing his book burned in public by the hangman. He was, moreover, condemned to perpetual imprisonment, and immured in the Tower accordingly. Three years later the pertinacious offender found means to publish from his prison two more pamphlets, in which he fiercely assailed the hierarchy, and was unsparring in his personal abuse of Laud. For this he was once more prosecuted; a fresh fine of £5000 was imposed on him; he was a second time pilloried, losing such stumps of ears as the hangman before had spared; and was branded on both cheeks with *S. L.* ('seditious libeller'—rather 'stigmata Landis' by Prynne's interpretation). He was removed successively to Lancaster, Carnarvon, and Mont Orgueil in Jersey, and remained a close prisoner till in 1640—the Long Parliament then sitting—he was released by a warrant of the House of Commons, and a tumultuous expression of popular sympathy celebrated his restoration to liberty. He acted as Laud's bitter prosecutor, leaving no stone unturned against his old enemy (1644); and in 1647 became recorder of Bath, in 1648 member for Newport in Cornwall. But opposing the Independents and Charles I.'s execution, he was one of those of whom Cromwell 'purged' the House of Commons, and was even imprisoned (1650-52) in Dunster, Taunton and Pendennis castles. On Cromwell's death he returned to his place in parliament, bestirring himself in the royalist interest; and after the Restoration Charles II. proposed to 'keep busy Mr Prynne quiet by letting him write against the Catholics, and pore over the records of the Tower,' of which records accordingly Prynne was appointed keeper. This did keep him fairly quiet until his death, which took place at Lincoln's Inn on 24th October 1669. 'Voluminous Prynne' Wood calls him; and the continuous stream of writings on the perilous topics of the day, which was always bringing him into trouble, represents but a fraction of his literary activity. He was a great compiler of constitutional history, his most valuable works in this field being

the *Calendar of Parliamentary Writs and his Records*, both of which contain much that is useful and important.

See vol. iii. of Howell's *State Trials; Documents relating to Pryune*, edited by S. R. Gardiner (Camden Society, 1877); and other works cited at CHARLES I. and LAUD.

Prytaneum, the town-hall of a Greek city, where the fire was kept perpetually burning, where ambassadors were received, where citizens who had deserved especially well of the state were sometimes allowed to live at the public expense; it was in fact the headquarters of the executive of the state. In Athens this body, the *prytaneis*, fifty in number, were chosen from the 500 members of the great council, five for each of the ten tribes. The five representatives of each tribe held office in rotation, one month at a time.

Przemysł, a town of Galicia, on the San, an affluent of the Vistula, 61 miles W. of Lemberg by rail. It is the seat of a Roman Catholic and a United Greek bishop, and a centre of the petroleum industry. Since 1874 it has been strongly fortified. Twice besieged by the Russians in the Great War (September-October 1914, October 1914-March 1915), it surrendered to Ivanov (22d March 1915), and was besieged and retaken by Mackensen (May-June 1915). Pop. 48,000, largely Jewish.

Psalmazar, GEORGE, 'the Formosan,' was born probably in Languedoc, between 1679 and 1685. Educated by monks and Jesuits at Avignon and elsewhere, he at sixteen turned vagabond, and for two or three years wandered through France, Germany, and the Low Countries, by turns an 'Irish pilgrim,' a 'Japanese convert,' a waiter, a 'heathen Formosan,' and a soldier. At last at Sluys he found a ready accomplice in one Innes, chaplain to a Scottish regiment, who baptised him 'George Lauder' after the governor, brought him over to London, and introduced him to Bishop Compton. For that credulous prelate he translated the Church Catechism into the 'Formosan' language; and to him he dedicated his *Historical and Geographical Description of Formosa* (1704), which found many believers in spite of its patent absurdities, such as that Formosa belonged, not to China, but Japan, and that the hearts of 18,000 boys were sacrificed every new year. The bishop sent him for six months to Oxford, and for a while he was lionised by the highest in the land. In spite, however, of his eating raw meat and enormous quantities of pepper and opium (an opium-eater he continued to the last), people gradually lost faith in him, or the novelty wore off, or by Law's *Serious Call* (1729) he was converted to a sense of the error of his ways. Anyhow, we find him the alleged importer of a white 'Formosan' enamel, a tutor, a regimental clerk (1715-17), a fan-painter, and lastly, for years a diligent hack-writer for the publishers. The *Universal History* was largely of his compiling; and his, too, a popular *Essay on Miracles*. But in all his strange life there is nothing stranger than the esteem expressed for him by Samuel Johnson. He was the man he 'sought after most,' 'the best man he ever knew,' a man whom 'he would as soon think of contradicting as a bishop,' and whose 'piety, penitence, and virtue exceeded almost what we read of as wonderful even in the lives of the saints.' An old man of fourscore years, he died in London on 3d May 1763.

See the autobiographical *Memoirs of . . .*, commonly known by the name of *George Psalmazar* (1764), and Farrer, *Literary Forgeries* (1907).

Psalms, BOOK OF. This title indicates a collection of songs set to music (for use in the temple and probably sometimes in the synagogue). A more intelligible term, which like 'psalms'

... of Greek origin, and is specially favoured by Philo, is 'hymns;' this corresponds exactly to the Hebrew *thillim*, 'praises,' or 'songs of praise.' The eucharistic element is in fact the most essential one in the book: with the solitary exception of Ps. lxxxviii. there is an undercurrent of thanksgiving even in the most melancholy compositions (cf. Eph. v. 19, 20). There was, however, an earlier stage of psalmody, as a linguistic study of the Hebrew title assures us, when the service of religious song was of a very rough nature, and not under the control of guilds of singers. The ancient Arabs used a term (*tahill*) which corresponds to *thillah* for the shouting of a short consecrated formula, and the common root of both names means 'to call, cry out.' Only by degrees did the Israelitish 'psalmody' rise from a shouting like that of the vintage or the bridal night to the carefully trained singing of later times. Indeed, as late as the fall of Jerusalem the noise of the Babylonian soldiers in the temple is compared to that of the worshippers on one of the olden feast-days (Lam. ii. 7).

The question therefore arises, Can our present psalms, so spiritual in tone and in form comparatively so artistic, really be the very forms of prayer and praise used by the pre-exilic Israelites? Or have they literally driven out earlier and less spiritual compositions? Or lastly, have the older formulae been greatly expanded and idealised, or even sometimes permitted to become imbedded in later works? For this last conjecture some analogies might perhaps be found in the prophetic literature (see, e.g., Isa. ii. 2-4, and Ewald, *The Prophets*, i. 82, 83), but it can only be admitted to a hearing on proof of the existence in a psalm of really strong inconsistencies of thought and language. Till that proof is given let us accept each psalm as the monument of some particular age, without attempting to extract by analysis fragments of earlier origin than the rest of the poem. To ascertain approximately that age or those ages is the function of criticism. True; but have the critics the means of doing this? 'When once it is admitted, as it must be admitted, that the titles cannot be absolutely relied on,' says an English commentator, 'we are launched upon a sea of uncertainty' (Kirkpatrick). By no means. The question of the origin of the Psalter is of course a complicated one, but we must not say that the student of complicated problems is like a mariner without a compass. There are three conditions upon compliance with which the disagreement of critics will be reduced within very narrow limits. The first is, that no critic should approach the Psalter until he has assimilated a good number of the best critical results which have been reached in other parts of the Old Testament. The second, that he should begin at the end of the Psalter—i.e. with Books iv. and v. (the date of which, as collections, cannot, for various reasons, be later than the accession of Simon the Maccabee), and work his way backwards. The third, that he should break radically with the custom of looking at each psalm by itself, with a view to determining its period. The reason of the first is that there are numerous similarities in language and in tone between the Psalms and other old Hebrew writings; many at least of which afford valid evidence of the date of the poems, the psalmists being in a high degree imitative, and infinitely more prone, for instance, to borrow from the prophets than the prophets to borrow from them. The reason of the second is that, the Psalter being a combination of five 'books' of psalms, it is natural to presume that the two last (which properly form but one book) are later as collections than the three first. These five books are (1) Ps. i. xli., (2) Ps. xlii.-lxxii., (3) Ps. lxxiii.-lxxxiv., (4) Ps. xc.-cvi., (5) Ps. cvii.-cl.

And that of the third is that within these five 'books' there are certain minor books or psalters, which have certain common characteristics, and may, at any rate at the outset of the inquiry, be presumed to contain works of the same (not too strictly defined) period. These minor psalters are the Davidic (to which the 'Davidic' psalms in Books iv. and v. do not belong), the Korahite, the Asaphite, and the Songs of Ascent (i.e. of pilgrimage), commonly mis-called 'Songs of Degrees,' in addition to which there are various other groups of psalms, not marked by traditional headings, such as the Hallel and the Hallelujah psalms, the deutero-Isaianic (i.e. those which suggest the writer's acquaintance with the exilic portions of Isaiah), and the Jeremianic (i.e. those which from internal evidence were written either by Jeremiah or by a follower of that great prophet).

Thus, the conscious or unconscious object of recent criticism of the Psalms has been the imparting a stricter and more scientific character to the argument from internal evidence. Not the least difficult part of the work is that which relates to the linguistic phenomena, the evidential value of which has often been too much depreciated. This kind of evidence is no doubt rarely conclusive, but even in the case of the highly imitative psalm-literature will lead the critical student to some perhaps unforeseen results, unless indeed his way is barred by the arbitrary assumption that all the evidences of later date in the supposed pre-exilic psalms have been introduced by editors. And what upon the whole are the results of a criticism which does not float 'upon a sea of uncertainty?' Two very definite ones may be mentioned, with a warning, however, to the student that the criticism of the Psalter is so interwoven with that of other Old Testament books that many good Hebraists might hesitate to endorse even these moderately-stated results. First, that there is a considerable number of psalms belonging to the pre-Maccabean and Maccabean Greek portion of the post-exilic period (see especially Ps. xlix., lxxiv., lxxix., ex., cxviii., cxlix.). The possibility of this theory (which was virtually held by Theodore of Mopsuestia) is expressly admitted in the margin of our own 'Geneva Bible.' The objections to it are of various degrees of plausibility; none of them, however, are conclusive. It has been urged, for instance, that the so-called Psalm of Solomon (the composition of which falls between 63 B.C. and 46 B.C.) breathe an entirely different spirit from the psalms which may most plausibly be referred to the period of the Greek rule and of the Maccabean rising. But it can be easily shown that the latter event was a turning-point in Jewish religion, after which we might fairly expect a considerable difference in the tone even of liturgical poetry. Moreover, the phrase 'an entirely different spirit' is an exaggeration. There are certainly the germs of the Law and its praises in Psalms i., xix. 7-14, cxix., and those of later doctrines of immortality and resurrection may (if the late dates of Ps. xvi., xvii., xlix., lxxiii. be granted) be not unreasonably found in parts of the Psalter, while several of the 'Pharisaean' Psalms of Solomon contain passages strikingly parallel to our Ps. xlix. A second result is that none of the extant psalms are the genuine work of David, who was doubtless a gifted musician and poet (the early tradition on this point is clear), but whose hymns were probably too little in accordance with later ideas of art and of religion to escape the great literary as well as political catastrophe of the Exile. Contrast the life of David in the Books of Samuel with the character sketched, evidently from life, in the so-called Davidic psalms. Granting that David lived in the service of an ideal which he sought, but often failed, to realise, could that ideal

have agreed with the picture presented to us in the Psalter? How much is there in the tone or the ideas or the implied circumstances of the psalms which agrees with the tone or ideas of the traditional speeches of David and with his traditional history? Enough perhaps to permit us to regard him as a far-off adumbration of the nobler members of the post-exilic church, and therefore also of Him who was the 'root and offspring of David' (Rev. xxii. 16), but scarcely more than this. Indeed the only doubt is, not so much whether any psalms are Davidic, but whether any are even pre-exilic at all. The fact (which, even without scientific proof, it would be unreasonable to doubt) that David composed some psalms was enough to make collectors call certain psalms, or collections of psalms, by his name, somewhat as the various expansions of the older law in different ages were usually referred to Moses. David was in fact the traditional founder of psalmody and to some extent (see below) a precursor of the religion of the Psalter. Perhaps, too, psalms which David really wrote may have been expanded or added to by later writers. The most plausible instance is Ps. lx.; but there is nowhere any necessity to adopt this view. It is safer to hold provisionally that certain psalms are as old as the epoch-making reign of Josiah. Yet the arguments for this view are seldom, if ever, cogent, and mainly depend for their acceptance on our ideas of historical probability, which ideas again depend on the picture we have formed, on critical grounds, of the Babylonian and Persian periods of the history of the Jews. Psalm xviii. is no doubt the psalm which would, more generally than any other, be pronounced pre-exilic. Some of the older critics were even quite sure that it was Davidic, influenced partly by the admission of the poem into what is called the appendix to Samuel (see 2 Sam. xxiii.), which, however, only proves that the poem was conjecturally ascribed to David (the idealised David of later times) by the editor of Samuel, who lived not long before the Exile. To the present writer an early pre-exilic date for this psalm seems incompatible with the internal evidence. He thinks that, though perhaps written in the reign of Josiah as a literary illustration of the life of David, it was adopted as a temple-hymn only after the return from exile, when it was doubtless interpreted as prophetic of a great future Davidic ruler or line of rulers (see Ps. xviii. 50). The final editing of the Psalter he ascribes to the temple-authorities in the time of Simon the Maccabee. The book would quickly be carried to 'Israel in Egypt,' and soon afterwards translated into Greek for the benefit of the great Jewish community at Alexandria. The date of this event cannot be fixed with precision, but it was at any rate before the Christian era.

Among the arguments for the post-exilic date of the Psalms none perhaps is more cogent than that which is based on their essential unity of tone. They have, in short, such a strong family likeness that it would be rash to spread their composition over too extensive a space. And if we all, or nearly all, belong to one period, can they be, in doubt which that period is? Is it not obvious that these temple-songs were written for a community which had absorbed, in some real though still imperfect degree, the high teaching of the pre-exilic and exilic prophets? Now, though it would be absurd to say that there were no psalms before the Exile, the writings of Isaiah and Jeremiah prove that the nation, as a whole, was as yet far from having assimilated the pure and spiritual prophetic religion, and that the priests in particular were unprogressive. How then should there have been temple-songs like those in our Psalter before that spiritual regeneration of which the 'Second

internal structure of a pseudomorph has no relation to the external form of the crystal. Two kinds of pseudomorphs are recognised: (a) *alteration* and (b) *substitution* pseudomorphs. Alteration pseudomorphs are the result of the chemical metamorphosis of the original mineral either by loss or gain, or exchange of constituents. Substitution pseudomorphs are minerals formed in the moulds or vacant spaces left by the total removal in solution of previously existing minerals.

Pseudonym (Gr. *pseudēs*, 'false,' and *onoma*, 'a name'), a false name adopted by an author which conceals his identity. Originally 'pseudonyms' was used of works deliberately published under a false name, so as to induce people to believe them the works of those whose names they bore, or of works erroneously attributed to a wrong person. Thus, there were pseudonymous gospels of Thomas and of Bartholomew; and the works circulated under the names of the classical writers, but proved not to be genuine, are pseudonymous works. But the term pseudonym is now most commonly used as an assumed name not

really meant to mislead—what in England is often called by the French words *nom de plume* or 'pen-name,' and nearly corresponding to the genuine French expression *nom de guerre*. There have been periods in history when the acknowledgment of the authorship of certain pamphlets or books might mean death or banishment to the writer. It is common to find books containing attacks on public men, or those consisting of theological controversy, and the literature of satire, appearing under assumed names. In recent times young authors especially have frequently risked a new work under a pseudonym, and have sometimes kept it up afterwards. Once an author is famous it is found advisable to stick to a pen-name. For instance, every one knew the writings of 'George Eliot,' but few would at once have recognised a work by Marian Evans. The present list is not intended to be exhaustive.

For further information, see the article ANONYMITY; and Halkett and Laing's *Dictionary of Anonymous and Pseudonymous Literature* (1881-88, enlarged 1926 et seq.).

Pseudopodia (Gr., 'false feet'), blunt, irregular processes of protoplasm thrown out and drawn in again by amebæ and some other animals. See AMEBÆ, PROTOPLASM, RHIZOPOD.

Pseudoscope (Gr. *pseudēs*, 'false,' and *skopeō*, 'I see'), an optical instrument through which, by

means of an arrangement of prisms, objects are seen with their relief inverted. What is convex appears concave. It was discovered by Wheatstone when experimenting on the Stereoscope (q.v.).

Pseudotsuga, a genus of conifers differing from *Abies* in having the cones pendulous with

deciduous scales, from *Picea* in having the needles flattish. *P. Douglasii*, the Douglas fir, the most widely distributed conifer of western America, stretches from British Columbia to Mexico. Its timber is valuable and grows quickly. Other species grow in North America and in Asia.

Psilophyton, a very simple Devonian fossil pteridophyte, with branched rhizome, upright, forked stem, somewhat spiny, and long terminal sporesacs. With it has been grouped *Asteroxylon*, one of the Rhynian fossils; and these (*Psilophytaceae*) have been joined with the *Rhyniaceae* (q.v.) as *Psilophytales*.

Psilotaceae, a family of homosporous pteridophytes of doubtful affinities, sometimes merged with the fossil *Sphenophyllaceae*, sometimes regarded as intermediate between horsetails and lycopods. There are two genera, *Psilophytum* (two tropical species) and *Tmesipteris* (one Australian). Roots are wanting. There are simple or scale-like alternate leaves or a dichotomous stem, and deeply forked sporophylls.

Psittacidae. See PARROT.

Pskov, a decayed town of European Russia, 9 miles SE. of Lake Pskov (50 miles long by 13 broad), by rail 188 miles NE. of Iltga and 160 SSW. of St Petersburg. Like Novgorod it was celebrated for its republican institutions after the 12th century. During the 14th and 15th centuries it was one of the Hanse towns, and had then a population three times as large as at present. In 1510 it was annexed to Moscow. During the wars with Lithuania Pskov was a stronghold of great importance. It contains a cathedral and numerous venerable churches and monasteries. Pop. 36,000.

Psophocarpus, a genus of Leguminosae, found in tropical Asia and Africa. *P. tetragonolobus* (Gou bean) is cultivated for its beans and tuberous roots.

Psoralea, a genus of Leguminosae (*Papilionaceae*), natives mostly of South Africa and North America. The flowers are blue, purple, or white. *P. esculenta*, the *Bread-root* or *Prairie Apple* of North America, is a herbaceous perennial, about a foot high, with a carrot-like edible root, swollen above the middle, and abounding in farinaceous matter. The European *P. bituminosa* resembles red clover, but has blue flowers and an intense bituminous smell.

Psoriasis (Greek *psōra*, a cutaneous eruption, supposed by some to be the itch) now signifies a disease characterised by slight elevations of the surface of the skin covered with whitish scales. The eruption begins in small rounded spots, which may remain small, or may enlarge indefinitely, the centre becoming more normal while the inflamed margin continues to extend. The spots are covered by white silvery scales, not easily detached from the skin, which, however, when they are removed, is seen to be red and dry. The parts most often affected are the fronts of the knees and backs of the elbows; whatever other parts may be attacked, these are rarely free from the eruption, and the distribution is always nearly the same on the two sides of the body. Itching is often absent altogether, and very seldom severe. The disease may occur at any age, but usually first manifests itself in youth, rarely before the age of six. It is extremely apt to recur: it is rare for a person to suffer from it only once.

Numerous causes have been assigned for the disease; it has been attributed to debility, gout, and many other constitutional states; and doubtless it may be associated with them. But, with the exception of heredity, no cause has been satis-

factorily shown to lead to its development. It frequently occurs in persons otherwise in perfect health, and, except in very severe cases, does not interfere in any way with their employments.

If left to itself, the disease generally tends to persist indefinitely. But in the great majority of cases it is very amenable to treatment, both local and constitutional. Locally, ointments containing tar, resinoin, chrysarobin, &c. are most in use; internally, thyroid extract and arsenic are much used. But some cases resist the most varied and persevering efforts for their cure; and nothing has yet been discovered which will prevent the tendency to recurrence of the disease.

Psyché (Gr., 'the soul'), an exquisite creation of the later mythology of Greece. She was the youngest of the three daughters of a king, and so beautiful that mortals mistook her for Aphrodite herself. The jealous goddess sent Eros to inspire her with a passion for the most contemptible of all men; but Eros was himself wounded as deeply by her glances as ever he had wounded others with his darts. He accordingly caused her to be carried to a beautiful palace of pleasure, and there every night he visited her, unseen and unknown, and left her before morning broke, warning her not to seek to know who he was. But her sisters played upon her curiosity, and persuaded her that she was embracing a monster in the darkness of night. Lighting a lamp when Eros was asleep, in her excitement she let a drop of hot oil fall on his shoulder. This awoke Eros, who upbraided her for her mistrust, and vanished. Psyche wandered about from temple to temple, inquiring for her lover. At length she came to the palace of Aphrodite, where she was seized by the goddess, and kept as a slave. Eros, however, invisibly helped and comforted her, reconciled her to his mother, and was finally united to her in immortal wedlock. In works of art Psyche is represented as a beautiful maiden with the wings of a butterfly. Her story was considered as an allegory of the progress of the human soul through earthly passion and misfortune to pure celestial felicity; but it must not be forgotten that it is a version of a widespread folk-tale. Apuleius (q.v.) gave it its most perfect form. It is well told in Walter Pater's *Marius the Epicurean*. See CUPID and Rohde, *Psyche: the Cult of Souls and Belief in Immortality among the Greeks* (Lond. 1925).

Psycho-analysis. See HYPNOTISM, FREUD, DREAMS.

Psychology.—It is the aim of psychology, or mental science, to give a systematic account of mind, or, in other words, to analyse mental experience, to state the conditions under which mental processes appear, and to determine the laws which govern their occurrence. Psychology is distinguished from such studies as history and literature, which also deal with mental life, by the fact that it is concerned not with particular detailed facts, but with the general nature of mind and the broad laws which underlie all concrete human activity. Again, it is distinguished from the sciences of organic and inorganic nature in that the mental processes possess a specific character of their own which cannot be explained in the terms of the physical, chemical, or vital processes that are dealt with in natural science. At the same time the connexion between psychology and biological studies, particularly physiology, has become increasingly close and important since it has been more fully recognised that scientific methods can be applied in the investigation of psychical processes, and that these processes as we know them, however distinct

in nature they may be, are yet dependent throughout on bodily conditions. In earlier centuries psychology, or mental philosophy as it was often termed, formed an integral part of general philosophy. It came to be understood, however, that the development of both studies was hampered by this intimate union, and that it was apt to result either in a dominance of the more abstract and general principles of philosophy, or in a misplaced application of empirical procedure and conceptions in the investigation of philosophical problems. It is admitted now that more assured progress is secured when psychology is treated as a special science dealing with mind as a definite form of reality according to the methods of inductive investigation. At the same time it seems plain that philosophy will retain a more direct connexion with psychology than with other branches of science, inasmuch as the problems suggested by the study of mind, such as those regarding the ultimate meaning and destiny of mind, must remain important objects of philosophical consideration.

While it may fairly be said that each one distinguishes with sufficient clearness and certainty between his own inner experience and other forms of existence, the attempt to state with adequate definiteness the characteristics which belong to all forms of mind, and at the same time serve to express its specific nature, is not without difficulty. The most important characteristic would appear to be the property of being conscious. This consciousness belongs to all the mental states which we experience; and since it does not seem possible to frame an intelligible conception of a mental state which should lack this property, we seem to be justified in assuming that it is to be found in all life that is properly mental, however low in the scale of development. It appears to be an ultimate characteristic, incapable of explanation through any other element; and all we can do is to point to it as the universal form in which mental processes appear, however different in detail they may be. Another fundamental characteristic is to be found in the fact of individuality. All mental experience, so far as we know it, is manifested only in private or personal form, such that only indirectly, and at the best imperfectly, can any one enter into the inner life of his companion. While in the physical world there is no such division, but rather continuous unbroken interaction, there does appear a certain individuality of form and life in organic nature. But it seems evident that, apart from the mentality which we may suppose that the higher animals at least possess, the individuality in the world of life is something quite distinct from the fundamental division in the realm of mind. Finally, it may be pointed out that additional definiteness in the delimitation of the psychical sphere is secured through the negative characteristic of lack of extension in mental facts: we cannot intelligibly describe mental processes, such as emotions or desires, in terms of spatial magnitude.

The form of observation which is employed in the ascertainment of mental facts is termed introspection, reflection, or self-observation. In principle the observation which is employed in psychology is the same as that employed in the study of external nature; it is the special character of the subject-matter on which it is exercised which gives it a special form and introduces certain difficulties. The introspective effort involves for most persons an unfamiliar and difficult attitude, and the facts with which it deals—e.g. the train of ideas—have often a vague and transitory character which makes any scrutiny difficult at the moment of their appearance, and which lessens also the value of the memory or retrospection by which the more direct scrutiny may be supplemented. The difficulties in

the way of exact introspection are no doubt great, but with care and adequate training results possessing a high degree of definiteness and trustworthiness can be obtained. It should be remembered that self-observation implies no new activity begun only with the special study of psychology, but is rather the elaboration and refinement of that acquaintance with his own inner life which every one possesses in some measure, and by which alone an intelligent and sympathetic intercourse with other men is rendered possible. One of the principle features of modern experimental work in psychology is to be found in its insistence on the necessity of organising introspection, of replacing casual and undisciplined efforts by systematic work in which there shall be detailed study of definite problems and arrangement of the most favourable conditions for exact introspection. While it is on the data secured by direct introspection that psychology must be based, it should be recognised that these data can be supplemented by the observation and critical study of the signs of mental processes in the minds of others as these are shown in expression, action, and language, and in the spiritual products of human development, such as religion and law and social institutions.

As a result of analytic study three main forms of mental fact are commonly recognised, viz. facts of cognition, of feeling or affection, and of action or creation. The first two forms are now universally recognised as distinct and fundamental; action, on the other hand, which with cognition was formerly regarded as an ultimate division of mind, is now by many psychologists regarded as a complex process which should be explained by reference to more ultimate cognitive and affective processes. Assuming for the present the validity of the threefold division, we may point out that it should be interpreted not as indicating three powers of mind, but rather as stating the chief groups which the psychologist is led to recognise on consideration of the common and the distinguishing features which the concrete processes exhibit. In cognitive processes there appears, as a common if not universal feature, the presence of an object to which the process refers: thus there is some thing or object which we see, remember, imagine, and so forth. In feeling, on the other hand, the reference to object is less essential; a more important feature is found in the relation to the self as being modified or affected in some way; and it may be noted that the moods in which feeling appears are characterised by a fundamental opposition, as, for example, of pleasure and pain. Keeping in view the doubt regarding action which was mentioned above, we may say that in action there appears the process of self-determination, the tendency to pass from the present to some other, dependent state of mind. At the close of this preliminary survey we may remind ourselves that here and in what follows the analytic distinction of different processes is not meant in any way to suggest that these processes exist in isolation and independence. We have, rather, to acknowledge at each point in the study of mind that the only concrete real state is one showing a complexity of elements, and that while one form of process may be dominant, each analysis continually reveals the presence of co-operating factors. In the following account the cognitive processes will be dealt with first, these being divided into the perceptual, ideational, and intellectual groups.

The characteristic feature of perception (sense-perception) is the direct knowledge of objects through sensory qualities which are dependent on processes in receptive or sense organs. Perception is normally a complex and varied activity, and the first aim of investigation is to determine the constituents which enter into the total process. As a

result of analytic study carried on by various methods certain elementary processes are recognised which are termed sensations, or presentative elements. These sensations may be regarded from two points of view: on the one hand, as elements in a cognitive process they involve the function of awareness or apprehension; on the other hand, there is presented in them a content towards which the apprehension is directed, and which possesses the properties of kind, or quality, and intensity. As instances of the former property we may refer to the qualities of colour and smell, of sweet and bitter; differences of intensity, again, are evident in sensations of tone, when, for example, the same pitch or quality is maintained, but the tone varies in loudness or intensity. A full account of sensations involves a study not merely of their nature as elements in the perceptual complex, but also of their relation to physiological and physical conditions. Reference may be made for details to the special articles dealing with each sense: only a very brief account can be given here, which may indicate the general nature and connexions of sensational experience.

Considering first the quality of sensations, we find that they may conveniently be divided into two main groups. The first is the group of sensations connected with the special sense organs: the stimuli are agencies in the external environment which act on receptive organs possessing in several instances a highly elaborate and delicate structure, and give rise to sensations whose characters are distinct, varied, and clearly known. This group includes the sensations which are termed visual, auditory, tactual, thermal, gustatory and olfactory: our knowledge is most extensive in regard to the first two kinds, and least satisfactory in regard to olfactory sensations. Organic sensations which form the second main group are conditioned by processes occurring within the organism; the receptive organs are relatively simple and undifferentiated, while the sensations aroused by their activity do not present such distinct and varied qualities as are met with in the former group, and tend to fuse or coalesce. The sensations aroused in direct connexion with movement of some part of the body are often classed together as kinæsthetic sensations: they include elements derived from contraction of muscle, stretching of tendon, and movement of joint. With them may be mentioned sensations such as dizziness, derived from stimulation of certain end-organs situated in the internal ear. There are in addition obscure sensations, such as those connected with the bodily functions of respiration and digestion; their intensity is normally slight, and when it is increased they tend to become distressing or painful. Pain sensations have relations with both groups, inasmuch as they may be caused by an external stimulus affecting the skin of the hand for example, or by some internal organic process.

It will be observed in studying the qualitative aspect of sensation how varied are its relations to sense organ and to stimulus. When attention is directed to the intensive aspect an important difference is met with; here, in a large range of cases where the conditions of exact investigation can be fulfilled, there is found the same law. This law, which was noted first by Weber, and named by Fechner after its discoverer Weber's Law, has been formulated thus: 'In order that the intensity of a sensation may increase in arithmetical progression the stimulus must increase in geometrical progression.' It should be observed that the law does not hold for the extreme upper and lower regions of the scale of intensity, and that it holds to some extent in other spheres also, for example in the estimation of spatial and temporal magnitudes, though in these cases the possibility has to be reckoned with that the underlying condition of the

judgment is some form of sensational (e.g. kinæsthetic) intensity. Since the publication of Fechner's *Elemente der Psycho-physik* in 1860 there has been prolonged controversy over the precise interpretation of the law and its bearing on the measurement of psychical magnitudes.

In addition to sensations which form so large a part in perceptual process, there are found also representative elements in which the presentative content of former experience is reproduced in altered form. While the nature of such elements can be understood more clearly in connection with the analysis of developed ideational processes, it is important to note here the place which they take in perception. The ordinary experience of the developed mind gives evidence of the truth that only through the retention and utilisation of past experience can advance in perceptual knowledge be achieved. This relation of past to present experience is capable of various interpretations; it is clear that one important form consists in the supplementation of the content which is given through the direct action of the senses by representations associatively aroused which fill out and vitalise the immediate presentative data. Thus for the child with growing experience a visual object, such as an orange, becomes enriched in some measure, even when it is only seen, with the qualities from taste, smell, touch, and movement which have been present on previous occasions. These representative elements exhibit no new sensory quality, and appear normally in perception in an implicit form, bound up with and dependent on what is directly given. As regards their physiological basis, it is recognised that they are conditioned by processes in the central nervous system which continue and on occasion reinstate the nervous processes underlying earlier presentative experience.

We pass next to the spatial and temporal factors in perception. As regards the first factor, it is to be noted that spatial perception is developed in a high degree in only two sensory groups, the visual and tactual, while in others, though in varying degree, it is much less fully elaborated. It has been maintained that all sensations have a certain inherent volume or extensity, forming like intensity an ultimate property of sensory experience: this view, though not definitely established, has much in its favour, and affords a basis for the varying development of spatial perception. One of the most important features is the process of localising impressions in the spatial field, a process which appears in markedly different forms in touch and in vision: in the former the localisation refers predominantly to the surface of the body, while in the latter it refers to positions in the space beyond the body, into which objects are 'projected.' In both touch and vision the varied movements, which are continually being carried out from the earliest infancy in connexion with the sensory activity, are of the utmost importance in helping to render more exact and extensive our knowledge of concrete spatial relations—distance, form, magnitude, and direction. If the presence of a spatial element in our original experience be conceded, as, for example, in the admission of a certain primitive extensity, the general view of space perception would belong to the nativistic type, according to which spatial intuition in some form is an ultimate factor in our mental constitution. Over against this stands the empirical or genetic view, according to which our spatial perception is wholly a product of development, in which motor experiences constitute the most important factor. While the controversy is by no means closed, there is in its modern stage a large amount of agreement as to the importance of development in the explanation of our mature spatial perception.

It is to be remembered that what is in question is not the objective spatial system of geometry, but the varying and imperfect processes through which we come to apprehend spatial relations. How full of variation these processes are could be shown only by a detailed account of the numerous illusions in the perception of space which modern investigation has detected.

The psychological study of temporal perception, which in several respects is analogous with the perception of space, deals among other topics with the distinction in our experience between past, present, and future, with the ability to date or localise events in the past, and with the estimation of intervals of time. The apprehension of temporal relations as it appears in the mature mind is a complex product of mental development. Representative processes would appear to be foremost in importance in this development: together with these there may be recognised the presence of affective processes and active tendencies. As regards the further problem of the ultimate origin of temporal perception, it may be noted that there are two general forms of theory, one which recognises an immediate primitive experience of duration or succession, while the other presents a genetic explanation, according to which the ultimate elements as such are devoid of temporal character.

In the second main group of cognitive processes, that of ideation, the predominant characteristic feature is that objects are apprehended in some form of more or less complex representative process. In perception, as was pointed out, the representative elements are implicit and dependent; in the ideation processes of imagination and memory these elements are explicit and relatively free to follow their own course.

Images, or ideas possessing a concrete sensory character, are normally less distinct and less complete than percepts, and they tend to lack the organic resonance and the feeling that accompany perception. Images of former visual experience are the most prominent and frequent, though reproductions of other forms of sensory experience, especially auditory and kinesthetic images, are also found. It has been maintained that in addition to these forms, which represent particular objects or scenes, generic images are formed in the course of experience which present the common features of a number of objects or examples, and may be compared with composite photographs in which the common elements appear with comparative distinctness. The question whether other non-sensory ideas are to be found will be referred to in connexion with conception. Of the three principles by which ideas have been supposed to be associated, that of contrast is of least importance, since the facts to which it refers can be otherwise explained: the principle of similarity, according to which present experiences 'tend to revive their like among previously occurring states,' while true and significant as a statement of the presence of persistent elements in the train of ideas, does not possess the primary importance as an explanatory principle of the law of contiguity. According to this law, stated in a very general form, those elements in our experience which have been present in consciousness simultaneously or in close succession tend afterwards to revive or suggest each other. Its far-reaching character is seen when we recognise that it lies at the basis of all acquisition in the cognitive sphere, and that it is related most intimately to the law of habit in the active sphere. While contiguity is the general or abstract condition of associative connexion, it is to be noted that special concrete factors, such as the recency, frequency, or vividness of a past

experience, co-operate in determining which one of the various possible lines of association shall be followed on particular occasions.

Considering next the actual concrete forms in which these processes appear, we note that imagination in its undirected or passive form is found where the succession of ideas is determined by the play of associative conditions, general or special, without the presence of an end or governing purpose: examples of this are seen in aimless reverie, day dreaming, and desultory thought. In directed imagination, on the other hand, while association plays its part, the course of ideas is determined primarily by the controlling thought of some plan or end: the activity may be termed receptive where the effort is made to realise from our own past experience the details of a scene or situation suggested, say, by traveller or poet, and constructive where, a certain more remote and general end being given, we attempt to create such new combinations of ideas as shall serve to solve in concrete form the problems which are set before us by practical, scientific, or other interests. The term memory, which is also used in a wider sense, is used here to indicate those states in which the course of ideas is directed with the view of representing the facts of past experience with truth and completeness. Two main directions of memorial activity may be distinguished. The first refers to definite events in past experience which as such are presented only once. Its full elaboration is dependent on the development of the process of temporal localisation, and the main conditions of its effective realisation are found in the attention given to the original experience and in its affective colouring. The second refers to facts and their connexions, such as the pupil finds in his lessons: the particular incidents of the learning process are a matter of indifference as compared with the final acquisition which is desired. The conditions named above are of importance here also, but repeated effort and the understanding of the connexion between that which is being acquired and elements in the knowledge which is already possessed are perhaps even more important. The relations between such acquisition and the formation of habit in the active sphere will at once be evident. In the process of active recollection the most favourable condition circumstance for the direct appearance of the desired ideas is concentration of attention on the general thought of what is sought: when this by itself fails, it can be supplemented by the voluntary awakening and review of the various associative connexions which may lead to the desired result. In the process of definite recognition, affective and active elements can be more or less clearly recognised: in its more explicit forms an important feature is often found in the presence of a group of ideas associatively aroused which represent the situation and connexions of the recognised object on its former appearance. The processes involved in memory have in recent years been the subject of extensive experimental investigation, in which Ebbinghaus was a distinguished pioneer. Results of much interest and value have been obtained, and it has been shown throughout the range of work that the processes are subject to definite laws.

The final section in the analysis of cognition concerns the intellectual processes through which the data of perception and ideation are elaborated as parts of a connected systematic experience. It must not be supposed that the separate treatment of these processes implies their action in independence or isolation: for the most part they are intimately united with the other processes which have been dealt with already, and are indeed in some measure required for the full realisation of

these processes. Assuming the presence of the function of apprehension which was noted earlier, we recognise the development on this basis of a group of processes which have a common and distinctive character. The awareness or discernment of relations among objects appears in various forms in our experience, it is implicit in simpler perceptual processes, but becomes distinct and explicit in the growth of intelligence. As directed specially towards the relations of likeness and difference in experience it may be termed assimilation and discrimination: these processes, again, enter as essential elements into the complex activity of comparison. The significance of the relating function in the development of knowledge is obvious, whether with regard to the relations already named or to others which are more specific and complex. The term conception, as ordinarily understood, refers to the process of grasping distinctly the common elements or features of the objects presented in our experience; the thought of these common elements forms the concept or general idea. According to certain psychologists, a distinct form of mental fact is to be found in the apprehension of the form or mode of combination of elements presented in experience: the perception of a melody, together with its identification when transposed from one part of the scale to another where the constituent tones may be completely different, has been given as an example. It has been urged that these various forms of cognition should be recognised not merely as being receptive in their general character, but also as being in a certain measure constructive or productive, and that by this recognition a more adequate view is secured of the mental activity involved in the organisation and extension of knowledge. The precise analysis of these facts is a matter of much difficulty, and on many points agreement has not yet been reached. In particular, there may be mentioned the prolonged controversy with regard to the Nominalistic and Conceptualistic accounts of the process of conception, the former of which dwells on the continuity between our concrete sensory experiences and the higher life of thought, while the latter emphasises the distinctive character of the conceptual process.

The essential function in the group of reasoning processes is the judgment. Looking at the simpler features of this process in its positive form from the psychological point of view, we seem to find in judgment a distinct intellectual attitude or function. The function is that of affirmation or assertion; what is asserted is in general some relation in one or other of the spheres with which thought deals, the relation being not merely apprehended or comprehended, but definitely accepted or believed. Judgment appears most clearly in connexion with states of doubt and questioning, but these do not appear to be necessary antecedents, and we may consider that it is present in other cases, as when definite steps are taken in the progress of knowledge. More detailed study would have to show, among other things, how as an occurrence in the history of the individual it is subject like the other intellectual processes to definite conditions in its development and exercise. In the main these are to be found no doubt in other cognitive processes; but other conditions, such as affective process and active tendencies, are also operative. Thus, as regards those states which we term conviction and belief, there is ground for assigning an important place to feelings such as hope and fear, to desires and active tendencies, and to the influence of tradition and authority. In explaining the activities of our cognitive life a prominent place is often assigned to apprehension, the process through which the knowledge which we already possess is brought to bear

in the understanding of new facts and experiences. The underlying processes are largely associative in character: at the same time it would appear that, at least on the higher levels, conception and judgment are also operative.

While attention has relations with other mental processes, its connexion with cognition is so essential that it will be considered here from this point of view. It is instructive to regard it not as a special form of mental activity, but as a mode in which the cognitive processes may appear. It may be said then that the main characteristic of the processes of perception, ideation, or intellection in the state of attention is that they are relatively clear or vivid. The distinction of degrees of clearness is perhaps most obvious when we compare one moment in our experience with another, but it can be applied also to the various processes included in the consciousness of a given moment; some of these are clear and focal, while others are obscure and marginal, or, to use a somewhat ambiguous term, subconscious. Regarded as a characteristic which appears under definite conditions, attention has been termed passive or active, according as its determining conditions are to be found in properties of our immediate experience, such as novelty or intensity, or in the voluntary processes. When its general significance is considered we note that it enables each cognitive process to attain a high degree of effectiveness, and thus may be regarded as an important general condition of cognitive development.

The life of feeling, to which we now turn, appears on the first glance to present much diversity in the character of the states and processes which are included in its sphere. Thus we seem to have sense feelings, æsthetic, intellectual and moral feelings, together with the special states of emotion and sentiment. While the existence of such facts is not doubted, they have been interpreted in different ways. One of the most suggestive of the interpretations is that which maintains, as the result of analytic study, that feelings have the same nature or quality throughout our mental life, from sense to intellect and will, and that the distinctions which are so apparent on the surface arise from the presence in varying degree, and in manifold varying combination with cognitive elements, of two affective qualities alone, viz. the opposed qualities of pleasantness and unpleasantness. According to another form of theory, that of Wundt, there are to be found, in addition to these qualities, other forms of feeling which have likewise to be regarded as showing a fundamental opposition, viz. feelings of excitement and tranquillisation or depression, together with feelings of tension and relaxation; these main 'dimensions' including many subordinate affective shadings. Unquestionably this latter view presents a richer conception of our affective nature than the former. It is not yet possible, however, to determine its permanent contributions to the theory of feeling owing to the obstacles that are met with in the analysis of this form of mental process, among which the difficulty of distinguishing between such new affective forms and obscure qualities of organic sensation is one of the most pressing. But it is important to note how both types of theory have cut themselves loose from traditional classifications, and agree in the interpretation of feelings on quite new principles. The older views, it should be mentioned, still have their adherents. Although owing to such facts the analysis of feeling exhibits a disconcerting lack of agreement in results, it should be kept in mind that a thoroughgoing revision of current conceptions was no doubt necessary to prepare the way for a truer account of its nature, and that the analytic aim and procedure are not in question.

Something of the same revolutionary analysis is found in the theory of James and Lange that the dominant and characteristic components of emotional states are to be found in the mass of organic sensation which is aroused in each case through the operation of the underlying physiological mechanism. The more rational statement, James says, is that 'we feel sorry because we cry, angry because we strike, afraid because we tremble'; in other words, it is the varying complex of organic sensations conditioned by modified activity, or disturbance, of visceral, respiratory, and other functions that constitutes in each case the specific state of emotion which we experience. It may be granted that the completeness of this type of explanation has been exaggerated, and that other elements intervene: that a dominant factor in emotional states from the lowest to the highest has been demonstrated seems to be beyond question. Biological consideration helps us to reach a further insight into the significance of emotion: it may reasonably be supposed that, in view of the immediacy, universality, and uniformity of the emotional response, we are dealing with a mode of reaction which is determined in the main by hereditary racial conditions. In sentiments, on the other hand, such as the ethical and intellectual, while the emotional thrill may in certain cases be observed, the characteristic feature is rather the union between feeling and complex systems of ideas—that is, with higher forms of our individual cognitive life. That these, apart from varieties of individual development, have their main conditions in the social life and stage of civilisation in which the person finds himself seems to be plain.

With regard to the conditions of affective process as these are found in other concomitant psychical activities, it may be noted first that the sensations vary greatly in feeling-tone—in their power to arouse distinct and intense feeling; and that when we consider the relations—spatial, temporal, and other—into which sensations enter in the complex perceptual state, we come upon another set of conditions of pre-eminent importance in the æsthetic sphere, such as colour arrangement, spatial form, auditory harmony, melody, and rhythm. In the ideational and intellectual spheres our feelings are determined not merely by the object—what is imagined, remembered, or thought—but also by the success or failure, the progress or obstruction, of the activities concerned with these objects. Lastly, as regards the active life we readily recognise the direct and universal significance of appetite and instinct as sources of feeling, and the less uniform but equally certain influence which progress and attainment, or thwarting and failure, have in more developed forms of action. With regard to the other aspect—the results which flow from the operation of feeling—we observe that in general the presence of pleasant feeling tends to the furtherance of both cognitive and active processes, and pain to their thwarting or diminution. Were evidence needed of the importance of feeling as a motive to action, we might find it in the place so generally assigned, whether in practical life or ethical theory, to reward and punishment, pleasure and pain.

While a survey of human conscious activity discloses many varieties of conative process, three main types may be distinguished, viz. impulse, desire, and volition. Of these, impulse is the most direct and simple. Its characteristic feature is the immediate, unhesitating realisation in outward activity in which its own strength and its relative isolation from the rest of conscious life are shown. In its explicit conscious form some thought of an end, some idea of what is to be done, is doubtless present, else the actions would form a mere blind succession. A more prominent element in con-

sciousness is the sense of tension or striving immediately related to the particular course of action. Together with these elements some kind of feeling is involved: according to the view which is taken of the ultimate qualities of feeling, we may recognise alone the pleasantness which tends to accompany all rapid unhesitating action, or, with this, a feeling of excitement. A more articulate form of conscious activity appears in desire. In this state, which lacks the tendency to swift realisation, the idea of what is sought is quite distinct: the consciousness of striving, while apt to be less intense and definite at any particular stage than it is in impulse, is more persistent, and may be related to varying and complex series of actions: feeling varies in quality and intensity owing to its complex relations to our thought of present or future and to the mode and degree in which our ends are being realised. Desire in general tends to appear in place of impulse when the latter is obstructed, or when the activity that is required for its satisfaction reaches some degree of complexity. The main sources of impulse and desire are to be found in appetite and instinct: at the same time we must not forget that habit may give rise to impulse, and that rational factors may help to constitute desire. The generally recognised appetites are hunger, thirst, and sex; to these there were added by Bain sleep, exercise, and repose. They tend to appear in consciousness with a certain regularity, the main explanation of this psychical rhythm being found in certain recurrent or periodic alterations in the bodily constitution. Instinct, which in the animal often exhibits prolonged series of definite and complex activities, shows itself in man principally in the shape of more or less general tendencies towards certain forms of behaviour. As instances of these instinctive tendencies there may be mentioned parental care, sociability, rivalry, play. From the physiological point of view the conditions of instinct are to be found in highly complex connexions within the central nervous system, which are hereditarily transmitted, and which tend to determine the form and direction of the activity evoked by a given stimulus or situation. In particular instances their influence may be overlooked or ascribed to other causes: a broad survey of human conduct, together with a comparison of animal and human behaviour, enables us to recognise their importance in our lives. And it is to instinct and appetite, though in different and varying degrees, that much of what is strong, persistent, and universal in conduct and in social institutions is due.

Volitional processes are not separated by any rigid line from those already dealt with: they will be considered as the highest developments of conation, in which a characteristic union of elements is found with full play of attention. A relatively high cognitive elaboration is a distinctive feature: it may take the form of detailed deliberation as to the end and anxious consideration as to means; or, again, it may appear as unhesitating direct intuition or insight. Feeling tends, in the complexity of its nature and course, to follow the complexity of the cognitive process on the one hand, and on the other the variation and fluctuation of the total conative process—its speed or slowness, its progress or delay: at the same time it enters in turn as a condition supplying an element in our motives, modifying the deliberating process, and furthering or hindering onward movement. The stage of choice is that in which a definite end is accepted. The process of choosing or deciding appears most explicitly when alternative courses of action of nearly equal attractiveness have been before us; but we may have the same process where there is no hesitation or balancing, but where fully conscious decisive steps are taken.

Finally, in connexion with the process of choice and the subsequent realisation of our decisions in action, there is found in varying intensity that consciousness of striving or effort which was noted as an ingredient in impulse and desire. Are these factors, choice and striving, to be regarded as specific new facts in which the conative process is expressed, or should they be resolved ultimately into cognitive and affective processes which have the appearance of distinctness because they are present in a unique union or synthesis? Our task will be limited to the statement of opposing views. It may be pointed out, on the one hand, that choice has at least a close analogy with judgment as regards both the central fact of decision, and its appearance with greatest distinctness after the stage of doubt; and that striving may be regarded as a complex experience, constituted by an intimate fusion of affective elements with kinesthetic sensations, actual or reproduced, whose different groupings would help to explain our consciousness of the varied direction of effort. On the other hand, it may be urged that while such factors are present, they fail to explain the essential onward movement of mind towards its ends, and that an adequate account must recognise the presence of felt tendency as an ultimate process. It may be said that the difficulties involved in this problem and also in the application of the conceptions of freedom and determination are due not merely to the complexity of the mental phenomena—action being in fact in any of its higher forms a synthesis of all our powers—but also to the fact that the strictly psychological inquiry is complicated in different ways by biological considerations and ethical requirements. Returning to the study of the concrete forms of the active life, we note that the volitional process as analysed above requires for its completion the resolution which shall persist until the end which was chosen has been realised. From the analytic point of view the central fact in resolution is the steadily maintained thought of the end together with its persistent attractiveness for the individual: in part, at least, the explanation of the fact is to be found in certain underlying organic properties similar to, if not identical with, those connected with memory, which in their varying degrees are found as innate characteristics of different individuals. Persistence of a different kind is found in those relatively fixed modes of behaviour which are termed habits. Their origin lies in the experience of the individual, the mental states which form their starting-points ranging from volition with repeated effort at the one extreme to indistinct impulse and desire at the other. As they become established attention and conscious control tend to lapse, actions are carried out with marked economy of effort, and the range of possibilities of action becomes more or less decidedly limited.

In the preceding account it has been necessary for analytic purposes to dwell mainly on the distinctions within mental experience rather than on its connexion and unity. It is of interest to consider now the points of view from which the general relation of conscious processes may be regarded. There is found in the first place the principle of the unity of consciousness, which may be formulated thus:—all the mental processes within our experience at any moment, however manifold and however varied in character they may be, unite to form one conscious self or mind. On this, as on a fundamental basis, the other more specific and detailed connexions are established. Again, there should be recognised the principle of the continuity of consciousness, according to which the successive mental states, though continually changing, and though interrupted by what to another person

would appear complete breaks of sequence, do yet for the subject himself form one continuous conscious series without rupture or disconnection. It might be argued that even in the deepest sleep and in fainting there is no absolute cessation of mental life; but it seems fairer to admit the probability that lapses do occur, while at the same time recognising that their existence does not prevent conscious continuity. There is found also in our experience a principle, which may be termed that of the interdependence of conscious processes. Reference has been made in the previous account to the influence which mental processes exert on each other, and further study would have strengthened our conviction of the inevitable mutual modification which occurs in the stream of consciousness. It is not meant in this statement to disregard the connexion between mental and organic processes. In view, however, of the continued controversy with regard to its interpretation as a form of causal interaction or as a non-causal parallelism of the two series—mental and bodily—its ultimate psychological significance is somewhat ambiguous. It has been urged that a complete view of mind should include a consideration of subconscious mental life, the term in this connexion meaning a distinct series of mental processes detached from the main personal stream of consciousness. Evidence for the existence of such processes has been found in such facts as those of automatic writing and the anaesthesia of hysteria. Such evidence is important, and the hypothesis of a secondary consciousness is no doubt legitimate: the phenomena, however, are obscure, and the alternative hypothesis of a physiological interpretation on the lines of unconscious cerebration has much in its favour. The phenomena of pathological alterations of personality are of much significance for the final interpretation of the nature of mind. All these phenomena however are more or less abnormal, and it may be urged that an adequate appreciation of the facts must be based on a study of the stable, systematised personality of normal life. In this normal personality these principles seem to be realised.

In the outline of mental facts which has been given above attention has been paid chiefly to the study of the normal mature mind of the human individual. It is evident that a general study of this kind requires to be supplemented by investigations dealing with the special varied relations of mental life: a brief glance at the range of these investigations will indicate the scope of modern psychology. In recent years the study of childhood and adolescence has been prosecuted with much interest and care, and the lines of growth have been traced by which the developed stage of mind is reached. The term Genetic Psychology, which is sometimes applied to this branch of investigation, has also been employed to designate the study of development wherever it appears. The forms of mind of the lower animals form the subject-matter of Animal Psychology, while these forms and the relations between them and the human mind are dealt with by Comparative Psychology: it is obvious that these relations acquire a profound significance when regarded from the point of view of evolution. The phenomena of mental disorganisation and defect are studied in Abnormal Psychology. Those features of mental life whose significance can be adequately grasped only through a consideration of the mutual influence of human beings are discussed in Social Psychology: the investigation of the products of common mental life, language—both the index and the tool of thought—custom, and myth, which is sometimes treated under this heading, is also designated Folk Psychology. The recognition of the intimate and continual connexion of mental experience with bodily processes,

and in particular with those of the central nervous system, lies at the basis of the investigations which are grouped together under Physiological Psychology. Finally, reference may be made to one of the later developments of psychological study, in which the attempt is made to employ the methods and principles of general psychology in the study of concrete problems, especially those which are of practical interest, such as those connected with education, psychiatry, and judicial procedure.

LITERATURE.—Among volumes giving an introductory account of the subject may be mentioned those written by Angell, Cairns, Höfling, James, Ladd, Mellone and Drummond, Stout, Sully, Titchener, Wundt. The following authors may also be named: *Experimental Psychology*, Myers, Seashore, Sanford; *Psychology of Childhood*, Drummond, Kirkpatrick; *Comparative Psychology*, Lloyd Morgan, Washburn; *Social Psychology*, McDougall, Ross.

For more advanced general study the following works are important: Baldwin, *Handbook of Psychology*, 2 vols.; James, *Principles of Psychology*, 2 vols.; Ladd, *Psychology, Descriptive and Explanatory*; Stout, *Analytic Psychology*, 2 vols.; Sully, *The Human Mind*, 2 vols.

Studies of special subjects will be found in the following volumes: Baldwin, *Mental Development in the Child and the Race, Social and Ethical Interpretations*; Stanley Hall, *Adolescence*, 2 vols.; Holthouse, *Mind in Evolution*; Külpe, *Outlines of Psychology (experimental)*; Preyer, *The Mind of the Child*, 2 vols.; Ribot, monographs on *The Psychology of Attention*, *The Diseases of Personality*, &c.; Storring, *Mental Pathology in its relations to Normal Psychology*; Tarde, *The Laws of Imitation*; *Études de psychologie sociale*; Thorndike, *Animal Intelligence*; Titchener, *Experimental Psychology*, 4 vols.; Tylor, *Primitive Culture*, 2 vols.; Wundt, *Grundzüge der Physiologischen Psychologie*, 3 vols. (partly translated), *Völkerpsychologie*, 6 vols.

Detailed articles and references to literature are to be found in Baldwin's *Dictionary of Psychology and Philosophy*, 3 vols.

Among journals partly or wholly devoted to the study of Psychology may be mentioned: *Mind*; *British Journal of Psychology*; *Psychological Review*; *American Journal of Psychology*; *Psychologische Studien* (continuation of *Philosophische Studien*); *Zeitschrift für Psychologie*; *L'Année psychologique*, *Revue philosophique*.

Psychotherapy. See HYPNOTISM, FREUD, DREAMS.

Psychrometer, an instrument for measuring the tension of aqueous vapour in the atmosphere: a wet and dry bulb Hygrometer (q.v.).

Ptah. See EGYPT (Religion).

Ptarmigan (*Lagopus mutus*), a northern bird in the same genus as the Red Grouse (*L. scoticus*), but changing to white in winter. The name *Lagopus*, used by Pliny, means hare's-foot, the toes as well as the legs being thickly clothed with short feathers, whereas in Black Grouse and other members of the allied genus *Tetrao*, the toes are bare. The Common Ptarmigan lives on Scottish mountains (especially in the north), and is widespread in Europe. It feeds on shoots, berries, and lichens, has a croaking cry, and is protectively coloured both in summer and winter. Burrows are often made in the snow, and the birds are very gregarious at that season. The ptarmigan moults thrice in the year, in summer, autumn, and winter; whereas the Red Grouse moults only twice, the male in autumn and winter, the female in summer and autumn. Both species moult their claws. The summer plumage of the ptarmigan is blackish-brown with gray and rufous markings, with a good deal of white on the wings, the tail, and underparts. The autumn plumage has more gray; the winter plumage is white, with a little black below the tail and in front of the eyes of the male. From eight to ten buffish-white eggs are laid in May in a mere scrap. Monogamy seems to be the rule. The flesh of the ptarmigan is much esteemed;

most of the 'ptarmigan' exposed for sale in Britain are Willow Grouse (*L. albus*) from Scandinavia. Among other species of *Lagopus*, besides Red Grouse and Willow Grouse, may be noted *L. rupestris* in Northern Asia and North America, the

Common Ptarmigan (*Lagopus mutus*), summer and winter plumage.

small *L. leucurus* from the Rocky Mountains, and the large *L. hemileucurus* from Spitz-bergen. See GROUSE; Howard Saunders, *British Birds*; Elliot, *Monograph of the Tetraoninae*; Baird, Brewer, and Ridgway, *North American Birds*, vol. iii.

Pteria, or PTERIUM. See BOGHIAZ-KEUL.

Pterichthys, a genus of primitive vertebrates (Hypostomes or Ostracoderms) from Devonian

Pterichthys.

strata, without jaws, without vertebrae, without limb girdles, with sculptured dermal plates, and with strange lateral appendages.

Pteridophyta, one of the four great divisions of the vegetable kingdom. In it, as in the Bryophyta, the alternation of generations is distinct. The sexual or gametophyte generation produces archegonia and antheridia, and from the fertilised egg springs the asexual sporophyte, from whose spores come new gametophytes. In the pteridophytes, however, unlike the bryophytes, it is the asexual generation that we recognise as the plant in the ordinary sense. The sexual generation is small and inconspicuous, often like a simple liverwort, or a mere plate or thread; the asexual approaches the flowering plants, and has leaves, stem, roots, and true vascular bundles. The Pteridophyta are thus classified:

I. Filicales. See FERNS, MARATTIACEAE, MOONWORT, WATER-FERNS.

II. Equisetales. See HORSETAILS.

III. Sphenophyllales: (1) Sphenophyllaceæ (fossil); (2) Psilotaceæ (Psilotum and Tmesipteris; living).

IV. Lycopodiales. See LYCOPODIACEÆ.

V. Pteridospermales. See FOSSIL; also FERNS (Fossil).

VI. Psilophytales. See RHYNIAEÆ, PSILOPHYTUM.

Pteridosperms. See FOSSIL; also FERNS (Fossil).

Pterocles. See SAND-GROUSE.

Pterodactyls (Gr., 'wing-finger'), remarkable winged reptiles, the remains of which are met with in the Jurassic and Cretaceous systems. There are numerous forms of Pterodactyl which are included in the extinct order Pterosauria. The head was relatively large and snout-like, the long jaws being furnished with simple and pointed teeth, implanted in separate sockets. The eye-orbit was very large, the sclerotic having generally a ring of bony plates, and the nostrils approximated to the orbits. The neck was long and bird-like, consisting of procervical vertebrae which were longer than the dorsals—the latter varying from twelve to sixteen in number. From four to seven vertebrae are ankylosed to form the sacrum. The tail is generally short, but long-tailed forms are also met with. The scapular arch and keeled sternum in their general characters resemble those of the carinate birds. There are four digits on each manus—the outer digit of the manus (corresponding to the fifth of the typical series) being immensely elongated for the support of a membranous expansion (*patagium*), which was also attached to the sides of the body to embrace the hind limbs and tail. The hind foot has five digits and is characteristically reptilian in structure. Most of the bones are hollow like those of birds. The body was probably naked.

Many forms of Pterodactyl are known, but all agree in possessing skulls which in general form are remarkably bird-like. In Rhamphorhynchus the extremities of the jaws are usually edentulous, and were perhaps sheathed in horn; the base of the jaws, however, was furnished with teeth which were inclined forwards. In the same form the tail was long, and provided at the extremity with a leaf-like steering membrane. In Dimorphodon the jaws are provided with strong teeth in front and much shorter ones behind; and the tail was long.

Some pterodactyls were small—Pterodracon being not larger than a sparrow. Others were about the size of a woodcock. Yet others, however, were much larger—some having a spread of wing of 5 or 6 feet, and even of 25 feet in the case of certain forms from the Cretaceous rocks of England. The form of its extremities shows that 'the Pterodactyl was capable of perching on trees, of hanging against perpendicular surfaces, and of standing firmly on the ground, when, with its wings folded, it might crawl on all fours, or hop about like a bird.'

Pterosaurians are well represented in the Mesozoic strata of Europe and North America. One of the richest repositories of their remains is the famous lithographic stone of Solenhofen, in which the fossils usually occur in a fine state of preservation—even the impression of the membranous wing being sometimes clearly seen. See Zittel's *Palæontology*, vol. ii. (trans. Eastman).

Pteromys. See FLYING ANIMALS.

Pteropoda (Gr., 'wing-footed'), a group of pelagic molluscs, a sub-order of Gasteropods. They are marked by two lateral lobes of the foot, used in swimming; and they have a superficial and secondary bilateral symmetry. They often swim in shoals and form part of the food of whales. The

popular name 'sea-butterflies' given to some of them refers to the wing-like lobes, the delicate build, and the beautiful coloration. There are two sections, probably of separate derivation, (a) the Thecosomata, e.g. Cavolinia and Cymbulia, with a delicate shell of lime or a gistle-like test, feeding on Protozoa and simple Algae; and (b) the Gymnosomata, e.g. Pneumoderma and Clione, with no shell in the adult, feeding on open-sea animals, including Thecosomata. Alleged Palæozoic Pteropods are very dubious; the earliest indisputable fossils are in early Tertiary deposits. See Pelsener, *Challenger Report* (1889).

Pterygotus. See EURYPTERIDA.

Ptolemaic System. See PTOLEMY.

Ptolema'is. See ACRE.

Ptolemy, name of the Macedonian kings of Egypt. The first, a son of Lagos, was called *Soter* ('Saviour') by the Rhodians, whom he defended against Demetrius Poliorcetes. He became one of the greatest of the generals of Alexander the Great (q.v.), and on Alexander's death became ruler of Egypt. For the other Ptolemies, his successors, see EGYPT; and for their patronage of literature, ALEXANDRIAN SCHOOL.

Ptolemy, properly CLAUDIUS PTOLEMEUS, a celebrated astronomer and geographer, was a native of Egypt, though it is uncertain whether he was born at Pelusium or Ptolemais in the Thebaid. Nothing is known of his personal history, except that he flourished in Alexandria in 139 A.D., and there is probable evidence of his having been alive in 161. The chief of his writings are the *Μεγάλη Σύνταξις τῆς Ἀστρονομίας*, which, to distinguish it from the next mentioned, seems to have been denominated by the Greeks and by the Arabs after them *megistê*, 'the greatest,' whence was derived the name *Almagest* (with Arab article *al*, 'the'), by which it is generally known; the *Tetrabiblos Syntaxis*, with which is combined another work called *Karpes* or *Centilogium*, from its containing a hundred aphorisms—both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; a treatise on the phenomena of the fixed stars, or a species of almanac; and the *Geographia*, his great geographical work. The rest of his works are of inferior importance, and consist of descriptions of various kinds of Projections (q.v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*.

Ptolemy, both as an astronomer and geographer, held supreme sway over the minds of almost all scientific men from his own time down till the 16th–17th century; but, and in astronomy specially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy he depended almost entirely on the labours of Hipparchus. But, as his works form the only remaining authority on ancient astronomy, the system they expound is called the *Ptolemaic System*, after the author.

As a geographer Ptolemy is the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from Ptolemy's writings, little is known. Ptolemy's improvements and suggestions are at once more valuable and correct; but it is sometimes difficult to separate his data from those of Marinus. His geography is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to 12ths of a degree), with a

brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places—by latitude (*mēkos*) and longitude (*platos*)—with the calculation of the size of the sphere of the earth, and of the extent of surface then known. The longitudes were calculated from Ferro (q.v.) in the Canaries, chosen as the westernmost part of the world; but he counted it only 2½ degrees W. of Cape St Vincent, instead of the real distance, 9° 20'. He took the parallel of Rhodes for his chief line of latitude, thinking it occupied the mean position in the zone of climate into which he divided the earth. He describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He also constructed a series of twenty-six maps, together with a general map of the world, in illustration of his work. See MAP.

THE PTOLEMAIC SYSTEM of astronomy, so called from Ptolemy, its chief expounder, was really originated long before his time, and was, in fact, merely an attempt to reduce to a scientific form the common and primitive notions concerning the motions of the heavenly bodies. It was implicitly adopted by Plato, Aristotle, Hipparchus, and (with the exception of the Pythagoreans, and probably of Pythagoras himself) all the eminent physicists and philosophers of ancient times; passing from them to the Byzantines and Arabs, who, especially the latter, were the means of disseminating it through western Europe, where it continued to be the universally established doctrine till the 16th century. The primary and fundamental doctrines of this system are that the earth is the centre of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having, previous to any accurate observation, established themselves as unquestionable axioms, phenomena which were found on closer examination to be inconsistent with them were explained by the introduction of additional hypotheses. The belief that the earth is the centre of the universe was supported by its accordance with the relation of the primary elements of which the material world was supposed to be composed. Thus, earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, either being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest enclosing the earth and its superincumbent elements, and the larger spheres enclosing the smaller. To each of these spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the Sun, Mars, Jupiter, Saturn and the fixed stars, *eight* in all. To this system later astronomers added a *ninth* sphere, the motion of which should produce the Precession of the Equinoxes (q.v.), and a *tenth* to cause the alternation of day and night. This tenth sphere, or *primum mobile*, was supposed to revolve from east to west in twenty-four hours, and to carry the others along with it in its motion; but the Ptolemaic astronomers do not venture to explain how this was done, although, since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the

axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens increased in accuracy it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit is only apparent, and results from the earth not being in the centre of the sun's sphere, C (see fig.), but at E, and consequently his motion appears to be slowest at P and quickest at R. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystalline, but in a small circle, whose centre was a fixed point in the crystalline, and which revolved on its axis

as it was carried round with the latter; thus (fig.) the planet was carried round the small circle ABP, as that circle was carried round PQR (now supposed to represent the planetary crystalline). The planet while in the outer portion of its small circle would thus have a forward, and in the inner portion a backward motion. The larger circle was called an *eccentric*, and the smaller an *epicycle*. This theory of eccentrics and epicycles satisfied the early astronomers; but further investigation showed its incompleteness, and in later times it was found necessary to explain newly-discovered discrepancies by heaping epicycle upon epicycle till a most complex entanglement resulted. As soon as astronomers came to understand and test the Copernican Theory (see COPERNICUS), this venerable and disorderly pile of hypotheses, which had received the papal seal of infallibility, and had in various forms held supreme sway over the minds of men for twenty centuries, at once crumbled to atoms and sunk into oblivion. See ASTRONOMY.

The *Almagest* and the *Geography* were the standard text books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the 15th century showed its deficiencies. Editions are the works by Heiberg (1898-1907); the *Almagest* and the most of the minor works, by Halma (Paris, 4 vols. 1813-28); the German translation of the *Almagest*, by Manitius (1912 *et seq.*); and for the *Geography*, the Latin versions of 1482 and 1490, published at Rome, the *editio princeps* of the Greek text by Erasmus (1533), the Elzevir edition (1619), those of Wilberg and Grashof (1844), Nobbe (1845), Müller (Paris, 1883), and the photographic reproduction of the Mount Athos MS., by Langlois (Paris, 1866). The catalogue of stars has been frequently reprinted separately, the best editions being Francis Baily's in *Mém. Roy. Astr. Soc.*, xiii. (1843); and Peters and Knobel's (Wash. 1915).

Ptomaines. It has been known for a very long time that food which has undergone putrefaction may, in certain circumstances, act as a violent poison, setting up severe catarrh, and producing symptoms of a more general nature. Stale mussels, fish, and sausages have even a popular reputation on account of their poisonous qualities. A ptomaine was first obtained by Marquardt in 1865, and described by him as similar to conine; in 1869 Sülzer and Sonnenschein isolated a crystallisable ptomaine which resembled in its qualities atropine and hyoscyamine. Of recent years attention has been called to this question from another point of view, and one of special interest to the medical jurist. At a trial at Rome, on the occasion of a supposed murder, a material was extracted

from the body which had markedly poisonous qualities, similar to those of delphinine. It was supposed by those who undertook the prosecution that this poison had been administered to the deceased, but on the side of the defence it was pointed out that the extract, though similar in some respects to delphinine, was in others quite distinct, producing on the frog's heart very different effects.

Attention having been called to the subject, scientific investigators, especially those of Italy and Germany, busied themselves in extracting these poisonous materials, ptomaines (Gr. *ptōma*, 'a corpse'), from putrescent animal matters, and investigating both their chemical and physiological properties. These ptomaines can hardly be said to form a very distinct group of bodies from a chemical point of view, for some, like putrescine and cadaverine, are amines; others are amido-acids, like creatinin; and neurine, which has choline and muscarine closely allied to it, is trimethyl-vinyl-ammonium-hydroxide. It cannot even be said to possess an alkaline reaction, at one time supposed to be a common property of all ptomaines, and one which related them to the vegetable alkaloids, for Salkowski showed that creatinin, a body that has been long known and apparently carefully investigated, when obtained pure gives no reaction with litmus-paper, nor does it possess the power of combining with acids like a base. Brierer, who first showed that alkaloids were formed by bacteria under a variety of conditions, and that some of them were poisonous, subsequently recognised that though organic bases may be formed and may be toxic, the important toxins do not belong to that category; rather was it probable that the extra-cellular toxins of diphtheria, tetanus, and other such diseases were of protein nature.

Neither from a physiological point of view can we look upon the ptomaines as *ani generis*, and in the first case because many of them are produced by the action of organisms *during their life*. As well-known examples let us instance creatinin and neurine, which are produced every day in our living bodies, showing that during the putrefactive process we cannot be said to find substances which stand alone, and are invariably different from those formed during digestion and assimilation. Finally, in respect to their poisonous properties, not only are some of them perfectly harmless or poisonous only in a minor degree, but it is highly probable that some of the most poisonous products of the action of putrefactive and other organisms are bodies (albumoses) of quite a different chemical constitution. The term Ptomaine is now much restricted in usage.

With regard to harmful effect, much greater stress is now laid upon the presence of the bacteria found in decomposing meat, &c. Some of the most dangerous of these, the bacilli of Gaertner, bacillus of Aertrycke, &c., belong to the same group as those of dysentery. The poisonous effects are due to the development of the bacilli themselves in the alimentary tract, following upon eating food that has been contaminated by their presence.

Ptosis (from the Gr. *ptōō*, 'I fall') signifies a drooping or falling of the upper eyelid, and arises from weakness of the muscle which elevates it, or from palsy of the third or *motor oculi* nerve. If it is congenital, or occurs without any apparent cause, and resists medical treatment, it may be removed by a surgical operation, by which the eyelid is brought under the action of the occipito-frontal muscle, which receives its nervous power from another source.

Ptyalin, PTYALISM. See SALIVA.

Puberty is the period of life at which the reproductive organs in both sexes begin to be func-

tionally active, and is marked by other important changes in the structure and functions of the body. Among the peoples of northern Europe it begins in girls at from twelve to fourteen, and in boys about two years later. In girls both growth and development are about this period much more rapid than in boys; the breasts enlarge, and the figure becomes full; the temperament changes; and the menstrual flow begins to appear. In boys the most obvious changes are the breaking of the voice and the growth of hair on the face. The changes begun at this time are not fully completed nor the bodily and mental vigour of adult life established for at least eight or ten years after the commencement of puberty. The health during this period is specially liable to be disturbed by adverse influences, particularly in the female sex; and overstrain, both of the physical and mental powers, should be carefully guarded against.

Publicani (from Lat. *publicum*, 'that which is public or belongs to the state'), the name given by the Romans to those persons who farmed the public revenues (*vectigalia*). These revenues were put up to auction by the censors, and were 'sold' for a period of five years. They were derived chiefly from tolls, tithes, harbour-duties, the tax paid for the use of public pasture-lands, mining and salt duties; and from the special taxes they collected, publicani were classified as *decumani*, *pecuarii* or *scripturarii*, and *conductores portorum*. As the state required them to give security for the sum at which they had purchased the collecting of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies (*societates*) were formed, the members of which took each so many shares and were thus enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Every *societas* had also a head-manager (*magister*), who resided at Rome, and transacted all foreign correspondence with the inferior officers who directly superintended the collection of the taxes. The publicani belonged to the order of *eques*, and formed from their immense profits a powerful capitalist class. Under the empire the land-tax and poll-tax came to be collected by officers of state in senatorial provinces, the *quaestor*; in imperial provinces, an imperial procurator assistant to the governor; while in provinces like Judaea, administered by an *eques*, the governor was himself at the same time procurator. The customs, on the other hand, even in the days of the empire, were still commonly leased out to publicani, and so undoubtedly in Judaea. No doubt territorial princes like Herod Antipas also employed this method of collecting their taxes.

The lessees again had their subordinate officials, who would usually be chosen from the native population. But even the principal lessees in later times were not necessarily Romans. Zacheus, the tax-gatherer of Jericho (Luke, xix. 1, 2), was a Jew. The tariffs were often very indefinite, opening a door to arbitrariness and rapacity. Hence in New Testament phraseology the terms *publicans* and *sinner*s are coupled together, while in the rabbinical literature tax-gatherers appear in a still less favourable light.

Public-houses. See INN, LICENSING LAWS.

Public Schools. The nine great public schools of England are Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St Paul's, and Merchant Taylors'. See the special articles on each, and EDUCATION.

Public Worship Regulation Act. See ECCLESIASTICAL COURTS.

Publishing. See BOOK-TRADE.

Puccini, GIACOMO, Italian operatic composer, was born at Lucca, 23d December 1858, and received his musical education there and at Milan. He established his fame in 1893, when his *Mauon Lescaut* was performed at Turin. It was followed three years later by *La Bohème*, and then by *La Tosca* (1900), *Madama Butterfly* (1904), *La Fanciulla del West* (1910), and *La Rondine* (1917). His last opera was *Turandot*, produced in 1926 with great success. He also composed many smaller works, among which *Gianni Schicchi* is refreshingly felicitous. He died 24th November 1924, at the height of his vogue.

Puccinotti, FRANCESCO (1794-1872), born at Urbino, was already an accomplished classical scholar when in 1811 he repaired to Pavia for a thorough course of mathematics, physics, and natural science. From these studies he passed on to that of medicine at Rome, and graduated with much distinction in 1816. The local malaria first engaged his attention. A work ardently opposing the prevalent Bionnian doctrine, and advocating a return to the rational medicine of Hippocrates, was followed up by able treatises on Pernicious Fever (1821) and on Inductive Pathology (1828). He passed from one medical chair to another, till, compromised in the patriotic movement of 1831, he was deposed from the professorship of Pathology at Macerata. His redoubled literary activity bore fruit in classic treatises on medical jurisprudence and on nervous maladies. In 1835-37 he made a special study of the cholera epidemic at Leghorn, at the same time giving to the world his masterly translation of Aretæus. In 1838 the Tuscan Archduke appointed him professor of Medical Jurisprudence at Pisa, and there he published his *Lezioni Speciali sui Mali Nervosi*, his work on the *Cachexia*, and on the maladies induced by rice-culture, and, above all, his masterpiece, the *Storia della Medicina*, in three volumes, representing the labour of twenty years.

Puck, or ROBIN GOODFELLOW, a familiar figure in the fairy-world of old English folklore, immortalised by Shakespeare in the *Midsummer Night's Dream*. His characterisation here keeps close to popular tradition in the merry tricks and mischievousness attributed to him. The name is really a generic term for a fairy, and we recognise it further in the Icelandic *puki*, the Irish *púca* (*pooca*), the Welsh *pŵcca*, even the Cornish *pizic*, and the Puk and Niss Puk of the Frisians and Danes. The Pucks occasionally perform kindly domestic functions, are small and dwarf-like in appearance, attach themselves to particular households, and are easily propitiated by offerings of cream and kindly names like the Irish 'good people,' the Scots 'good neighbours.' They may assume the form of a horse, a hound, or the like, and are even confounded with such dancing lights as the Will-o'-the-Wisp or Jack-o' Lantern. Robin Goodfellow once filled a prominent place in the popular imagination—we meet him at full length in the 1628 black-letter tract, *Robin Goodfellow: his mad pranks, and merry Jestes, full of honest mirth, and is a fit medicine for melancholy*. Henslowe's Diary tells us that Chettle wrote a drama on his adventures; we find him again in Drayton's *Nymphidia*, Burton's *Anatomy of Melancholy*, Ben Jonson's *Masque of Love Restored*. As Lob, Hobgoblin, and the Lubber-fiend also the allusions to him in our earlier literature are endless.—The name *Puck* was taken for its title by the well-known New York counterpart to *Punch*.

See J. O. Halliwell's *Illustrations of the Fairy Mythology of A Midsummer Night's Dream* (Shaksp. Soc. 1845); W. J. Thoms's *Three Notelets on Shakespeare* (1865); and W. C. Hazlitt's *Fairy Tales, &c., illustrating Shakespeare and other English Writers* (1875).

Pud, or POOD, a Russian weight which contains 36 lb. avoirdupois (40 lb. Russian).

Pudding-stone. See CONGLOMERATE.

Pudsey, a municipal borough (incorporated 1900) in the West Riding of Yorkshire, 3 miles E. of Bradford, with important woollen and other manufactures. Pop. 14,000.

Puebla, the third city of Mexico, capital of a state of the same name, stands on a fruitful plain, 7120 feet above sea-level, 68 miles SE. of the city of Mexico, and near Orizaba and Popocatepetl. It was founded in 1531, and is one of the handsomest towns in the republic, with broad, straight, clean streets; many of the houses, which are generally three stories high, have quaint fronts of red and white tile-work. The city contains many churches, theological, medical, art, and normal schools, a museum of antiquities which dates from 1728, two large libraries, a number of hospitals, &c. On the great square stands the cathedral, a Doric building with two towers, valuable pictures, and most sumptuous decorations. Puebla has a thriving trade and many factories; the chief products are cottons, marble, and tiles. Pop. 101,000. Puebla was besieged for two months by the French, and then taken by storm, 17th May 1863.

Pueblo, capital of Pueblo county, Colorado, on the Arkansas River, at the mouth of Fountain Creek, 105 miles S. by E. of Denver. Through its iron and steel industry it has rapidly become the second city of the state and an important railway centre; immense quantities of raw materials and fuel abound in the vicinity. There are great smelting works, besides foundries, boiler and machine shops, and other iron and steel industries. Pop. (1880) 3217; (1890) 24,558; (1900) 28,157; (1920) 43,050, or with environs, about 60,000.

Pueblos (Span. *pueblo*, 'village'), a semi-civilised family of American Indians in New Mexico and Arizona, dwelling in large single habitations, which are sometimes capacious enough to contain a whole tribe. These edifices—which are often five or six stories high, and from 130 to 433 yards long, with many rooms (53 to 124) on each floor—are commonly constructed of adobe or sun-dried brick; the ground-floor is invariably without doors or windows, entrance being effected by a ladder leading to the second story; and indoors ladders take the place of staircases everywhere. A somewhat pyramidal aspect is given to the whole building by each successive story receding a few feet from the line of that below it. Each family of the tribe has a separate apartment, and there are also large rooms for general council-chambers and for tribal dances. In New Mexico there are a score of such villages. Their occupants are skilful agriculturists, employing irrigation ditches extensively, and rear horses, cattle, and sheep. Spinning and weaving and the manufacture of pottery also are carried on. The Moquis of Arizona are a related tribe, in villages built on the tops of isolated hills. The Pueblos under Roman Catholic missionaries have grafted on Christianity many old pagan beliefs and customs. They were first visited by the Spaniards about 1530, at which period their habits and their habitations were very much the same as to-day. It is evident, however, from the wide area over which the ruins of old pueblos and remains of ancient pottery have been found, that they were at one time very much more numerous than they are now. See a monograph by J. W. Fewkes (Bur. of Amer. Ethnol., 1920).

Puerperal Fever. In its old and wide sense this term embraced all forms of disease in the puerperal or lying-in woman accompanied by a high temperature. At the present day it is used

in a more restricted sense, being synonymous with the more scientifically correct terms *puerperal infection* or *puerperal sepsis*, and signifying the morbid conditions arising in the puerperium from the introduction of organisms into the genital tract.

It is probable that the disease has existed from the very earliest days, and there are references to it in the oldest medical literature. For centuries the view of Hippocrates was accepted without challenge—that it was due to the suppression of the lochia or discharge from the uterus (a common symptom). Later it came to be regarded as a specific fever peculiar to puerperal women, and its occurrence was regarded as an act of Providence calling for no explanation, and involving no responsibility upon any one. In the last century this comfortable doctrine had to be given up, and with it the term 'puerperal fever,' signifying, as it does, a specific fever, ought also to yield to the more correct synonyms mentioned above.

The beginning of the modern conception of the disease dates back to the published work of Dr Charles White of Manchester in 1773. He taught that the disease was contagious, advocated the washing out of the womb, and the propping up of the patient so as to favour drainage. He urged the importance from the preventive point of view of absolute cleanliness in all the patient's surroundings, her clothing, and her person, and insisted upon the beneficial influence of fresh air. It is not easy at this date to realise how revolutionary such teaching was—nearly a century before the discovery of bacteria by Pasteur, and of antiseptic surgery by Lister! White's work was far in advance of his time, and, although his teaching was followed for some time by British obstetricians, yet it was allowed to drop into disrepute. For this reason much of the credit due to White has been given to a Hungarian genius, Ignaz Semmelweis, whose discoveries were certainly epoch-making. In 1847 Semmelweis was assistant in the Maternity Hospital at Vienna, where the mortality from 'puerperal fever' ran at about 10 per cent. or more. A somewhat similar mortality occurred in practically all such institutions throughout the world at this time. Occasionally epidemics broke out, which swept the hospitals like a veritable plague, and sent the mortality up to figures that were appalling. Semmelweis noticed that in one of his wards, which was attended only by midwives, the disease was comparatively rare, while in another, to which medical students also had access, the disease was rife. Since these students came direct from the dissecting rooms and from the surgical wards which were reeking with 'wound fever,' and examined the patients without necessarily washing their hands, he concluded that the disease must be due to the introduction into the genital tract of minute portions of dead and decomposing matter on the fingers of the students. He accordingly insisted upon a simple disinfection of the hands in chlorine water before examining patients, and the result was an immediate and marked drop in the frequency of the disease in that ward. At the same time Semmelweis also pointed out that the condition was essentially similar to the 'wound fever' which raged throughout every surgical ward at that time. Some twenty years later Lister proved the organismal nature of 'wound fever,' and Pasteur demonstrated the presence of organisms in the discharge from a case of 'puerperal fever.' In this way the real nature of puerperal infection was discovered, and it will be observed that if we substitute the word 'organisms' for the words 'minute portions of dead and decomposing matter,' Semmelweis's discovery was accurate.

Others whose names deserve mention in con-

nection with the early recognition of this condition are Dr Gordon of Aberdeen, who, in 1795, pointed out that the condition was contagious, and could be carried from one patient to another by the attendant; and Dr Oliver Wendell Holmes, who, in 1843, emphasised the same points in America with all the eloquence and literary distinction at his command, but with comparatively little result. Even Semmelweis's discoveries were scouted by the obstetricians of his day, and ultimately he died a disappointed and broken man in a Hungarian asylum. As is so often the case, Semmelweis's fame became much greater after his death than during his lifetime.

We now know, then, that puerperal infection is due to the introduction of organisms into the genital tract, and that it is essentially the same as the septic infection of any wound. In some cases the organisms are present in the genital tract before labour (so-called auto-infection), but in the majority of serious cases they are probably introduced during or immediately after the confinement by the employment of hands, instruments, or utensils that are not scrupulously clean in a surgical sense. The condition is therefore a largely preventable one, and any prevalence involves a heavy responsibility upon all associated in attendance upon the patients during labour and in the puerperium.

While the conditions of the genital tract after labour are always favourable to the growth and development of organisms, there are certain circumstances which particularly affect them. Thus the liability to infection is greater after severe labours, owing to the greater wounding of the genital canal, to the greater amount of handling necessitated, and to the exhaustion of the patient. Women debilitated by under-feeding, hæmorrhage, or previous disease are also more prone to infection. The resistance of the individual patient, which may be affected by these conditions, is an all-important factor both in the occurrence of the disease and in the prognosis.

Without entering into the subject of the bacteriology of puerperal infection, it may be said that there are two main types of infection, which may frequently be distinguished clinically. The first type is due to the growth of saprophytic organisms upon pieces of dead tissue, such as blood clots or fragments of the placenta and membranes, which have been retained in the birth canal. The result of the growth of these organisms is the production of toxins or poisons which are rapidly absorbed by the patient, and lead to more or less serious symptoms. The second type is the result of the introduction of parasitic organisms—that is, organisms capable of living upon live tissues. These when conveyed into the genital tract develop in and upon its walls, and readily pass into the patient's blood stream, causing a general blood-poisoning or *septicæmia*.

The symptoms of puerperal infection may set in at any time within a fortnight of labour, but in the vast majority of cases they ensue within the first five days. The first symptom is usually a shivering or 'rigor,' followed by a rise in temperature and pulse rate. The lochia may become fetid, or may be suppressed, and there may be pain in the abdomen and tenderness. The organ most commonly affected in the first place is the uterus, but the infection may spread rapidly to any or all of the pelvic organs and tissues. The result in all cases is to produce an acute inflammation of the organ, rapidly passing on to suppuration. If general septicæmia supervene, all the organs of the body share in the intoxication. Occasionally the infection is of so virulent a character that the patient succumbs before any of the typical

changes in the organs have had time to show themselves.

The outlook in all cases is serious, but where the condition depends upon the growth of saprophytic organisms in some retained dead tissues (*sapremia*), the results of prompt treatment are eminently and almost uniformly satisfactory. If, on the other hand, the symptoms are due to the absorption of organisms themselves (*septicæmia*), the results of treatment are much less satisfactory. In these cases local treatment applied to the genital tract itself is as often as not useless, for the source of danger has already passed into the blood. The upshot of the disease depends almost entirely upon the patient's general strength and powers of resistance. If these are considerable they may in time be able to overcome the organisms; otherwise the result will be rapidly fatal.

The preventive treatment (*prophylaxis*) of puerperal infection is, however, one of the most notable triumphs of modern medicine, and in no other sphere have the beneficial results of Lister's great work been more manifest. This at least applies to hospitals, where antiseptic methods were adopted immediately after their application to ordinary surgery. The result has been that, instead of the constant high mortality of pre-antiseptic days, it is now a very rare thing to find any well-conducted hospital in which the mortality from this disease is more than a fraction of 1 per cent. Unfortunately the same improvement has not taken place in private practice. The disease is still responsible for far more deaths in a year than any of the other diseases and accidents of child-birth, and this is entirely due to the difficulty of carrying out and maintaining in practice, particularly amongst the poorer classes, a sufficiently scrupulous cleanliness in methods and technique. The chief points to be attended to are the cleanliness of the room in which the patient is to be confined; the cleanliness of the bed and bedding; the cleanliness of the patient's person; and the scrupulous cleanliness of the hands of the attendant, and of any instrument or utensil that comes in contact with the birth canal. Special care is required to prevent infection being carried from one patient to another, and it must be remembered that infection may be conveyed not only from a case of a similar nature, but also from any infected wound or sore. The requisite cleanliness of the hands of the attendants can only be attained after prolonged washing and the free use of antiseptic lotions, and preferably the wearing of sterilised rubber gloves, while all instruments should be capable of being boiled before use.

The improbability of obtaining these suitable conditions of cleanliness amongst the poorer classes is obvious, and for all such patients a maternity hospital is much the safest place for confinement. In practice amongst those who are better off the required conditions may with care be attained, although in every case unremitting attention to the details is necessary. Even in such circumstances, however, if there is reason to anticipate that a labour will be difficult, and require operative interference, it is wiser for the patient to arrange to go into a good nursing-home, where hospital conditions of surgical cleanliness can be more thoroughly attained.

A definite improvement in regard to the frequency of the condition in private practice may also be expected to follow legislative effort. In this connection the Midwives Acts have been of great value, forbidding, as they do, the practice of unlicensed midwives, and providing for the better training, examination, and supervision of those who are licensed. The lives of scores of women are being saved every year as a direct result of their wise provisions.

The wider adoption of the Notification of Births Act may also be expected to produce good results, in so far as it prevents any woman being entirely neglected during her puerperium.

Puerperal Insanity. This term is commonly used in a general sense to include the various forms of insanity in women associated with reproduction. Eight per cent. of all cases of insanity in women come under this category, while one out of four hundred pregnant women is likely to be affected with mental disorder.

Insanity of Pregnancy is not common. It usually comes on about the sixth month, and tends to a melancholic type, associated with a revulsion of feelings towards husband and children. Recovery is delayed in most cases until after delivery.

Insanity of the Puerperium usually comes on within the first ten days after labour. It tends to an exalted type, and may be suicidal or infanticidal. Eighty per cent. of cases recover within a few months.

Insanity of Lactation comes on gradually several months after labour in a woman who is nursing. It is depressed and melancholic in type. Seventy per cent. of cases recover after some months.

In all forms hereditary predisposition plays a large part in the causation. Septic infection is an important factor in puerperal cases, the frequency of this form being much less than in pre-antiseptic days. The mental depression and anxiety associated with unmarried motherhood make insanity peculiarly frequent amongst such patients.

The outlook in all forms is good. Although all cases do not recover, yet the recovery rate is higher than in any other form of insanity.

The treatment is on general lines. The child, if born, should be removed, and nursing stopped. Unless trained attendants can be provided, early recourse to an asylum should be had in the best interests of the patient's speedy recovery.

Puerto Bello. See PORTOBELO.

Puerto Cabello, a seaport of Venezuela, 78 miles W. from Caracas. It stands on a long, low, narrow peninsula on the Caribbean Sea, and has a safe, deep, and roomy harbour, defended by a fort and batteries. It is the port of Valencia, which is 34 miles distant by rail. There is an active foreign trade; the chief exports are coffee, cacao, copra, woods, and hides. Pop. 140,000.

Puerto Cortés, a port of Honduras (q.v.).

Puerto de Santa María, El., a seaport of Spain, stands at the mouth of the Gnaodate, on the Bay of Cadiz, 22 miles by rail (all round the bay) N.E. of Cadiz and 8 S.W. of Xeres. It is one of the principal export harbours for sherry, and manufactures silk, soap, hats, leather, spirits, beer, &c. The bull-fights here in May are among the most famous in the country. Pop. 20,000.

Puerto Méjico. See COATZACOALCOS.

Puerto Plata, the chief port of the Dominican Republic, on the north coast of the island of Hayti. Pop. 7000.

Puerto Principe, now called CAMAGÜEY, an important inland town in the east of the island of Cuba, 40 miles S.W. of its port, Nuevitas, with which it is connected by railway. It manufactures liquorice and carries on a busy trade. Pop. 93,000.

Puerto Rico. See PORTO RICO.

Puff-adder (*Bitis* or *Echidna arietans*), one of the most venomous and dangerous vipers of South Africa. Its popular name refers to its habit of puffing itself up when irritated. It attains a length of 4 or almost 5 feet, and is often as thick as a man's arm. Its head is very broad; its tail suddenly tapered; its colour brown, chequered with dark brown and gray or white. The puff-

adder is very sluggish, and often lies half buried in the sand of the desert, its head alone being raised above ground. Its poison is used by the Bushmen

Puff-adder (*Bitis arctatus*).

for their arrows. The River-jack (*Bitis nasicornis*) of tropical West Africa can erect two or three enlarged scales, like little horns, above the nostrils.

Puffball (*Lycoperdon*), a genus of Fungi (Gasteromycetes). They mostly grow on the ground, and are roundish, generally without a stem, at first firm and fleshy, but afterwards powdery within; the powder consisting of the spores, among which are many fine filaments, loosely filling the interior of the *peridium*, or external membrane. The *peridium* finally bursts at the top, to allow the escape of the spores, which issue from it as very fine dust. Some of the species are common everywhere. Most of them affect rather dry soils, and some are found only in heaths and sandy soils. The most common British species is *L. gemmatum*, generally from one to two and a half inches in diameter, with a warty and nearly surface. The largest British species, the Giant Puffball (*L. giganteum*), is often many feet in circumference, and filled with a loathsome pulpy mass when young; but in its mature state its contents are so dry and spongy that they have often been used for staunching wounds. Their fumes, when burned, have been used not only for stupefying bees, but even as an anæsthetic. The same properties belong also to other species. Some of them, in a young state, are used in some countries as food, and none of them is known to be poisonous.

Puff-birds (*Bucconidae*), a family resembling Kingfishers in form, but living on insects like Flycatchers; they also resemble the Bee-eaters, and are found only in South and Central America. See BARBET, and Selator's *Monograph of the Jacamar, and Puff-birds* (1882).

Puffendorf. SAMUEL, BARON VON PUFFENDORF (or Pufendorf), writer on jurisprudence, was born on 8th January 1632, at Chemnitz, in Saxony. He began the study of theology at Leipzig, but in 1656 went to Jena to study national law and mathematics. Whilst acting as tutor to the sons of the Swedish ambassador at Copenhagen war broke out (1658) between Denmark and Sweden, and Puffendorf was thrown into prison. During the eight months he was kept there he thought out his *Elementa Jurisprudentiæ Universalis*. It was dedicated to the Elector Palatine, who appointed Puffendorf to the professorship of the Law of Nature and Nations at Heidelberg. He next exposed the absurdities of the constitution of the Germanic empire in *De Statu Reipublicæ Germanicæ* (1667), which raised a storm of controversy. In 1670 he was called to fill the chair of the Law of Nations at Lund, and there wrote

the work on which his fame now rests, *De Jure Nature et Gentium* (1672), a work based upon the system of Grotius (q.v.), but completed and extended in the line of Hobbes' speculations. Some years later the king of Sweden made him his historiographer, with the dignity of a councillor of state. In his official character he published a dry history of Sweden, from the expedition of Gustavus Adolphus into Germany to the death of Queen Christine. In 1688 the Elector of Brandenburg invited him to Berlin to write the history of the life and reign of the Great Elector. He died in that city on 26th October 1694.

See LÖRMER, *Institutes of Law of Nations* (vol. i. 1883); H. von TREITSCHKE, in *Preussische Jahrbücher* (1875); and DROYSSEN, *Abhandlungen zur neueren Geschichte* (1876).

Puffin (*Fratercula*), a genus of birds of the Auk family, characterised by a gaily-coloured bill—red, orange-yellow, and bluish gray—with a horny frontal sheath divided by transverse grooves

Puffin (*Fratercula arctica*).

into several distinct pieces. At the end of the breeding season these furrows deepen, and the sheath is shed. There is in fact an annual moult of the bill sheath and of the horny plates above and below the eyelids. In form, size, and colour the new bill-sheath differs markedly from the old one. The genus *Fratercula* embraces three species, of which only one, the Common Puffin (*F. arctica*), a bird a little larger than a pigeon, frequents the rocky shores of the Atlantic Ocean. It occurs in many parts of England and in Wales, while on the coast and islands of Scotland and Ireland it is often abundant, especially at the breeding season, when the birds congregate in large colonies. The egg, which is of a dull white marked with pale brown or lilac, is laid sometimes in a crevice of a cliff, sometimes in the burrow of a rabbit, or in a cavity made for the purpose. The nestling, which is covered with sooty black down, remains in the nest for three weeks, and is fed on small fishes. The adult birds feed on crustaceans and other marine animals. On land they waddle rather than walk, but they swim and dive well, and their flight is rapid though seldom high. In various localities the puffin is popularly called *Sea-parrot*, *Conterneb*, and *Tamminorice*. In the Pacific the genus is represented by the Horned Puffin (*F. corniculata*). There also is found the closely allied genus *Lunda*, with bright yellow bill. The eggs of the puffin are much sought after, and the flesh of the young birds is used as food. For details as to the strange moulting and renewal of the bill, see *Zoologist* (July 1878).

Pug-dog. This breed of dog is generally supposed to have been brought over from Holland,

where it is very common. Its origin there is unknown. The pug may be described as a miniature bulldog, though he differs in the shape of his ears, which should fall forward like a terrier's, and of his tail, which should curl tightly against his quarters. The broad under-jaw and wide skull of the bulldog are rarely seen, but should be present in a perfect specimen. Some years prior to 1860, when the pug was fashionable, Mr Morison of London and Lord Willoughby d'Eresby paid great attention to the breeding of pugs, and founded two distinct strains known as the Morison and Willoughby pugs. Large prices were paid for pure specimens of either strain, but when the fashion in ladies' dogs took another direction prices came rapidly down. The two strains have been so often recrossed that it is difficult to obtain a pure specimen now. The pug is only fit for a house-dog, as he is useless for any active work. Beyond a tendency to get very fat he is well fitted for this, as his short, smooth coat is easily cleaned, and he is a handy size.

Puget Sound, a large inland sea in the north-west of Washington State, communicating with the Pacific by the Admiralty Inlet and Juan de Fuca Strait. It is divided into several branches, penetrates far into the interior, and is everywhere navigable for the largest vessels, which in most places can ride close to the shores, and load or unload without wharves. Great quantities of pine and fir are shipped from a country rich in timber. At Bremerton is a United States navy yard.

Pugilism, or **BOXING** (Lat. *pugil*, 'a boxer'; compare 'pugnacity,' from *pugnus*, 'a fist'). 'To box' is almost as old as our language itself: no special explanation is required to show what boxing is; every one knows that it is fighting—real or mimic—with the hands alone, all weapons being foreign to the 'science.' The beginnings of pugilism are lost in the realms of Greek mythology. Apollo and some of the offspring of Zeus and Poseidon were reckoned good fist-fighters. According to Homer and Virgil, Troy was the scene of dire encounters between the heroes. Pugilistic fights, governed by a strict code of rules, became a feature of most of the Greek games. The fighters wore a belt—probably to obviate foul hitting—and a type of leather glove called a *cestus*. The sport was later introduced into Rome, where the brute tastes of the gladiatorial crowds required that the *cestus* should be reinforced with rings and studs of lead or iron. From the decline of the Roman Empire little is heard of pugilism till the dawn of the 18th century in England.

As pugilism, in what used to be its generally accepted sense—prize-fighting—is now extinct as a sport, it may be of interest to give a brief sketch of its past, when it played a more important part—or was thought to do so—than boxing does now in the formation of the national character.

Apart from such forms of the sport as were practised in the ancient world, England was emphatically the home of pugilism. In no other country was such a fair, manly, and well-governed system of combat established as that under which the English settled their quarrels, especially after the rules of the prize-ring were issued in 1743 by Broughton, the first recognised champion of England. The rules held good for nearly a century; but in 1838, after a fatal battle, they were revised, entirely in the direction of diminishing the danger of such contests, although it should be remarked that fatal results to prize-fights were extremely rare, and in most instances occurred through what may be termed accidental or secondary causes. In Broughton's rules 'minute time' was allowed between the rounds—each bout of the struggle being

called a 'round,' and lasting until one or both of the men were down; but this was altered in the new rules to half a minute. It was properly decided that if a man could not recover himself sufficiently in that time to face his antagonist he must be so weak or stupefied that further fighting would be dangerous. In Broughton's time, too, the seconds were allowed to carry their principals to the 'scratch'; this was forbidden by the new rules on the same grounds as the previous alteration. The purpose of both sets of rules was to secure fair-play and to foster a kind of rude chivalry, objects not without value when we remember the classes most likely to come under their influence, and the angry quarrels either code was intended to regulate. No man was to be struck while he was down; and no man might be struck below the belt—the belt in practice being a handkerchief tied tightly round the waist. With prize-boxers these handkerchiefs were the 'colours' of the men, chosen by themselves and worn by their partisans. Kicking, biting, and the horrible 'gonging'—once so frequent across the Atlantic—were all 'foul,' and their practice instantly lost a man the battle. There were two seconds, or, as they were sometimes called, bottle-holders, to each man: their duty was to lift their principal when he fell; to carry him to his corner—always selected by tossing a coin, the winner of the toss naturally choosing the side of the ring which placed him with his back to the sun; to sponge or sprinkle him with water; to wipe the perspiration or blood from his face; and, as their second title implies, to refresh him with sips from the water or brandy bottle. They used also to carry in their jacket pockets a supply of powdered resin, which the boxer would rub on his hands to enable him to clench them tightly when he grew tired; but this practice was made 'foul' by the new rules. The 'scratch,' to which allusion has been made, was a mark in the centre of the ring which the combatants had to 'toe,' face to face, before hostilities could commence. It was also an indispensable formality for the men and their seconds to shake hands prior to the first round, all six crossing hands to do so, something like one of the figures in the Caledonian quadrilles; this prevented anything like a sudden rush by either of the men upon his unprepared foe. The 'ring' itself was a square of 24 feet, marked out by four corner and four middle stakes, round which ran two ropes at a height from the ground of 2 and 4 feet respectively. The prize-ring had a dialect of its own, a 'flash lingo.' The fists were 'mauleys,' and when both boxers struck with the same hand at the same time the blow was called, aptly enough, a 'counter-hit,' or only a 'counter.' When one struck with the right and the other with the left at the same time the blow was a 'cross counter.' 'Counter' was the most exciting and the severest mode of inflicting punishment.

For many years prize-fighting maintained an enormous popularity, and an existence which, if not actually legal, was scarcely to be distinguished from it. One of the last—and one of the greatest—prize-fights took place at Farnborough in 1860 between Tom Sayers and J. C. Heenan, an American pugilist. It was a brutal encounter, and public opinion was immediately roused. But the real decadence of the prize-ring dates from the establishment of police in every county of England, which rendered it well-nigh impossible to 'get a fight off'; the leading patrons of the sport withdrew disgusted at the continual disappointment. From the absence of any legal restraint there had always been danger of disorder and riot, to check which no adequate force could be provided; yet latterly such scenes grew more frequent and worse

in character, so that the demand from its opponents for the suppression of the ring gained in strength, while the efforts of those who would preserve it were proportionately weakened. Accordingly it is now a thing of the past, and in its place has sprung up the boxing match of our own day, which is usually a display of 'science,' not mere brute force. 'Boxing' was once equivalent to 'pugilism,' the general term for 'fistic' manoeuvres, but is now reserved for 'sparring' with padded gloves. These, of course, are used to prevent the injuries which the naked knuckles might inflict, although a very respectable amount of punishment can be dealt even with the largest gloves. These fights came to be conducted under the Queensberry rules, so called from the marquis of that name who first drew them up (1890). The characteristic finish of a boxing match is the 'knock-out,' a blow to the chin, heart, or solar plexus which renders the recipient insensible for a period of not less than ten seconds. Otherwise a win may be obtained on 'points' (for blows, style, &c.) awarded during the contest. New rules were issued by the National Sporting Club in 1923, requiring the ring to be from 14 to 20 feet square, the gloves not less than 6 oz. each in weight, the rounds to be of not more than three minutes' duration with one minute interval, and not more than fifteen in number, except in championships, where twenty are allowed. The rules of the Amateur Boxing Association are a modification of the preceding. The number of rounds is usually three, and the size of the ring from 12 to 14 feet square. The maximum weights for championship competitions are as follows: Fly, 8 st.; bantam, 8 st. 6 lb.; feather, 9 st.; light, 9 st. 9 lb.; welter, 10 st. 7 lb.; middle, 11 st. 6 lb.; light-heavy, 12 st. 7 lb.; heavy, any weight.

Broughton was followed by a series of champions, amongst whom the most famous were probably John Jackson (1769-1845)—known as Gentleman Jackson; Jenn Belcher; Tom Cribb (1781-1848), the most fearless, honest, and simple-minded of gladiators; Spring (1795-1851); Tom Sayers (1826-65); and Jenn Mace, with whom the series practically closed. Another pugilist, John Gully (1783-1863), who began life as a journeyman butcher, might have been champion, but he retired from the ring and became M.P. for Pontefract (1832-37), an owner of extensive coal-mines, and, what to many of his admirers was a fact of much greater importance, his racers thrice won the Derby. The popular idol at one time was Jack Shaw (1789-1815), the life-guardsmen, a pugilist of herculean strength, who is said to have killed, or placed *hors de combat*, ten French cuirassiers at Waterloo before he was himself slain. The most outstanding boxing champions have been Jim Jeffries (world champion, 1899-1904), Tommy Burns (1906-8), Jack Johnson (1908-15), and Jack Dempsey since 1919. Other boxers worthy of mention are Georges Carpentier, Bombardier Wells, Jimmy Wilde. The biggest matches have taken place in the United States. At the Dempsey-Carpentier fight at Jersey City in 1921 the 'gate-money' exceeded a million and a half dollars.

Many men of the highest standing took a keen interest in the prize-ring. The great Duke of Wellington was its firm supporter; Sir Robert Peel and Lord Palmerston lent their influence to it; and Lord Byron, who was a pupil of Jackson, refers to him in a really respectful style in the notes to *Don Juan*. George Borrow's fight with the 'Flaming Timman' is truly Homeric; and he lands boxing as he lands all things English. Thackeray, too, whose nose is said to have been broken in a school fight with a future church dignitary, devoted one of his *Roundabout Papers* to the fight between Sayers

and Heenan. When the allied sovereigns visited London after the peace of 1814, it was deemed fitting by the highest authorities to show them a display of boxing, supported by the best pugilists of the day—a display greatly admired by the visitors. Boxing in its modern sense appeals to and is supported by all social grades, an effect largely due to the activities of amateur clubs.

Miles, *Pugilistica* (2 vols. 1906); T. G. Wignall, *The Story of Boxing* (1923); B. Lynch, *Knuckles and Gloves* (1922), *Complete Amateur Boxer* (1924); and books by R. G. Allanson-Winn, Driscoll, Wilde, and Carpentier.

Pugin, AUGUSTUS WELBY, architect, was born in London on 1st March 1812, the son of a French architect, Augustin Pugin (1762-1832), in whose office, after schooling at Christ's Hospital, he was trained, chiefly by making drawings for his father's books on Gothic buildings. Whilst working with Sir C. Barry he designed and modelled a large part of the decorations and sculpture for the new Houses of Parliament (1836-37). Early in life he became a convert to Roman Catholicism; and most of his plans were made for churches and other ecclesiastical edifices belonging to that communion, the most successful being perhaps a church at Ransgate, Killarney Cathedral, Adare Hall in Ireland, and the Benedictine chapel at Douai. He died insane at Ransgate, on 14th September 1852. He enriched the literature of his profession by *Contrasts . . . between the Architecture of the 15th and 19th Centuries* (1836), *A Treatise on Chancel Screens* (1851), and *The True Principles of Christian Architecture* (1841). See B. Ferrey's *Recollections of A. W. Pugin and his Father* (1861).

His son, EDWARD WELBY PUGIN (1834-75), succeeded to his father's practice, and was the architect of many Roman Catholic churches, &c.

Puisne Judges. See COMMON LAW.

Pulaski, CASIMIR, a Polish count who fell in the American revolution, was born in Podolia, 4th March 1748, took an active part in the war against Russia, and lost his estates and was outlawed at the partition of Poland in 1772. In 1777 he went to America, and for his conduct at the Brandywine was given a brigade of cavalry, which he commanded until March 1778. He then organised 'Pulaski's legion,' a corps of lancers and light infantry, in which he enlisted even prisoners of war and deserters. In May 1779 he entered Charleston, and held it until the place was relieved; a furious assault which he had made on the British was repelled, but he afterwards followed and harassed them until they left South Carolina. At the siege of Savannah on the 9th of October he fell in the assault at the head of the cavalry, and died on board the brig *Hasp* two days later.

Pulcheria (399-453), sister of Theodosius II., was Byzantine empress from 450. See EUDOCIA, and Miss Teetgen's *Life* (1907).

Pulci, LUIGI, an Italian poet, born at Florence, 3d December 1432, was an intimate friend of Lorenzo de' Medici and of Politian. He is the author of a celebrated poem, *Il Morgante Maggiore* ('Morgante the Giant'), a burlesque epic of which Roland is the hero. This poem is one of the most valuable sources for the early Tuscan dialect, the niceties and idioms of which have been employed by Pulci with great skill (see ITALY, *Language and Literature*). The first edition appeared at Venice in 1481. Pulci wrote further a humorous novel and several humorous sonnets. He died in 1484 (or 1487).—His brother BERNARDO (born circa 1430) wrote

an elegy on the death of Simonetta, mistress of Giuliano de' Medici, and the first translation of the *Ecloques* of Virgil.—LUCA, another brother (born 1431), wrote a poem in honour of Lorenzo de' Medici's success in a tournament; *Il Ciriffo Calvaneo*, a metrical romance of chivalry; *Dratelo d'Amore*, a pastoral poem; and *Epistole Eroiche*.

Pulex. See FLEA.

Pulicat, a town of British India, 25 miles N. of Madras, the first settlement of the Dutch in India; pop. 4000. It stands on an island in a large inlet of the sea called the Lake of Pulicat.

Pulkova, a village of Russia, 10 miles S. of St Petersburg, the site of a magnificent observatory (59° 46' 18" N. lat. and 30° 18' 40" E. long.), built by the Tsar Nicholas in 1838-39. In 1882 one of the largest telescopes in the world was erected here.

Pulley, one of the mechanical powers, consists of a wheel, with a groove cut all round its circumference, and movable on an axis; the wheel, which is commonly called a *sheave*, is often placed inside a hollow oblong mass of wood called a *block*, and by the sides of this block the extremities of the axle of the sheave are supported; the cord which passes over the circumference of the sheave is called the *tackle*. Pulleys may be used either singly or in combination; in the former case they are either *fixed* or *movable*. The *fixed pulley* (fig. 1) gives no mechanical advantage; it merely changes the direction in which a force would naturally be applied to one more convenient: thus, W can be raised without lifting it directly by merely pulling P down. The *single movable pulley*, with parallel cords, gives a mechanical advantage = 2 (fig. 2); for a little consideration will show that, as the weight, W, is supported by two strings, the stress on each string is $\frac{1}{2}W$, and the stress on the one being supported by the hook, A, the power, P, requires merely to support the stress on the other string, which passes round C. The fixed pulley, C, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel there is a diminution of mechanical advantage—i.e. P must be more than half of W to produce an exact counterpoise; if the angle made by the strings AB and BC is 120°, P must be equal to W; and if the angle be greater than this there is a mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system one end of each cord is fastened to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight, W, is fastened), and is fastened to the block of the next pulley, with the exception of the last cord, which passes round a fixed pulley above, and is attached to the counterpoise, P. The tension of a string being the same in all its parts, the tension of every part of the string marked (1) in fig. 3 is that which is produced by the weight of P; consequently, as the last movable pulley is supported on both sides by a string having a tension, P, the tension applied in its support is 2P. The tension of the string marked (2)

Fig. 1.

Fig. 2.

is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shown that the force applied by the strings marked (4) in support of the last pulley (which

Fig. 3.

Fig. 4.

Fig. 5.

is attached to W) is 8P. Hence we see that, according to this arrangement, 1 lb. can support 4 lb. if two movable pulleys are used; 8 lb. if there are three movable pulleys; 16 lb. if there are four movable pulleys; and if there are n movable pulleys 1 lb. can support 2^n lb. It must be noticed, however, that in practice the weight of the cords, and of the pulleys, and the friction of the cord on the pulleys must be allowed for; and the fact that in this system all of these resist the action of the power, P, and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much more convenient in practice, and is modified according to the purpose for which it is to be used; two prevalent forms are given in figs. 4 and 5. In this system one string passes round all the pulleys, and, as the tension in every part of it is that produced by the weight of P, the whole force applied to elevate the lower block with its attached weight, W, is the weight P multiplied by the number of strings attached to the lower block; in fig. 4 $W = 4P$, and in fig. 5 $W = 6P$, the pulleys in the upper block being only of use in changing the direction of the pulling force. This system is the one in common use in architecture, in dock-yards, and on board ship, and various modifications of it—such as White's pulley, Smeaton's pulley, &c.—have been introduced; but the simpler forms shown above have been found to answer best.—The third system (fig. 6) is merely the first system inverted, and it is a little more powerful, besides having the

Fig. 6.

weight of the pulleys to support the power, instead of acting in opposition to it, as in the former case.—The mechanical advantage can be traced out by finding from the form of the combination the ratio between the run of the tackle over the last sheave and the vertical ascent of W, when motion is set up. Theoretically, the larger the number of movable pulleys in any one combination the greater is the mechanical advantage

afforded by it; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys.

Pullman, GEORGE MORTIMER (1831-97), the inventor of the well-known 'cars,' was born in New York state, engaged in the business of moving and raising buildings, and as early as 1859 made his first sleeping-cars, and in 1863 the first on the model with which his name is now associated (see RAILWAYS). The Pullman Palace-car Company was formed in 1867 under his presidency. In 1880 he founded an industrial town, since absorbed by Chicago.

Pulmonates. See GASTEROPODA.

Pulo-Penang. See PENANG.

Pulpit (Lat. *pulpitum*), an elevated tribune or desk, from which sermons, lectures, and other solemn religious addresses are delivered. In great churches the pulpit is commonly placed on the north side of the nave against the wall, or in

juxtaposition with a pillar or buttress (see also AMBO). The pulpits of the Low Countries and of Germany are often masterpieces of elaborate carving in wood and stone, frequent subjects for treatment being the Conversion of St Paul, the Call of Peter and Andrew, and Adam and Eve (as in the wood-carved pulpit by Verbruggen in St Gudule at Brussels). Sometimes the canopy or sounding-board is the part most elaborately adorned by carving in wood or stone, as in the pulpit at Fotheringhay, Northamptonshire. Amongst the masterpieces of

Pulpit (Fotheringhay, Northamptonshire, 1440).

Nicola Pisano are the beautifully wrought marble pulpits of the baptistery at Pisa, and of the cathedral at Siena. Some are adorned by bronze-work. The pulpit (in Arabic, *minbar*) forms one of the scanty appliances of Mohammedan worship.

Pulque, a favorite beverage of the Mexicans and of the inhabitants of Central America; made from the fermented juice of different species of Agave (q.v.).

Pulsatilla, or PASQUE FLOWER. See ANEMONE.

Pulse (Lat. *puls*), a name for the edible seeds of leguminous plants, as corn is the name for the edible seeds of grasses. Peas and beans are the most common and important of all kinds of pulse; next to them may be ranked kidney-beans, lentils, chick-peas, pigeon-peas, &c. The best kinds of

pulse are very nutritious, but not easy of digestion, and are very apt to produce flatulence.

Pulse (Lat. *pulsus*, 'a pushing or heating'). The phenomenon known as the arterial pulse or arterial pulsation is due to the distension of the arteries consequent upon the intermittent injection of blood into their trunks, and the subsequent contraction which results from the elasticity of their walls. It is perceptible to the touch in all excepting very minute arteries, and, in exposed positions, is visible to the eye. The pulse is usually examined at the radial artery at the wrist, the advantages of that position being that the artery is very superficial, and that it is easily compressed against the bone. It is usual and convenient, though not quite accurate, to include under the term the conditions observed between the beats, as well as those produced by them. The condition of the pulse depends mainly on two factors, each of which may vary independently of the other: *first*, the contraction of the heart, which propels the stream of blood along the artery; and *second*, the resistance in the small arteries and capillaries, which controls the rate at which it leaves the artery. The first determines the frequency and rhythm of the pulse and the force of the beats; but the tension of the artery between them and their apparent duration depend mainly upon the peripheral resistance. 'Feeling the pulse,' therefore, gives important information besides the rate of the heart's action, and implies much more than the mere counting of pulsations. Dr Broadbent says, 'A complete account of the pulse should specify (1) the frequency—i.e. the number of beats per minute, with a note of any irregularity or intermission or instability of the rhythm; (2) the size of the vessel; (3) the degree of distension of the artery between the beats; (4) the character of the pulsation—whether its access is sudden or gradual, its duration short or long, its subsidence abrupt or slow, note being taken of diastolism when present; (5) the force or strength of both the constant and variable pressure within the artery, as measured by its compressibility; (6) the state of the arterial walls.'

The frequency of the pulse varies with age, from 130 to 140 per minute at birth to 70 to 75 in adult males, and with sex, being six or eight beats more in adult females. In some individuals it deviates considerably from this standard, and may even be habitually below forty or above ninety without any signs of disease. It is increased by exertion or excitement, by food or stimulants, diminished in a lying posture or during sleep. In disease (pneumonia, for example) the pulse may reach 150 or even 200 beats; or, on the other hand (as in apoplexy and in the affection known as heart-block), it may be as slow as thirty or twenty or less.

The normal regular *rhythm* of the pulse may be interfered with either by the occasional dropping of a beat (intermission), or by variations in the force of successive beats, and in the length of the intervals separating them (extra-systoles). These varieties often occur in the same person, but they may exist independently of each other. Irregularity of the pulse is natural to some persons; in others it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or especially by the disorder of the heart known as auricular fibrillation.

The other qualities of the pulse are much more difficult to recognise, though of no less importance. The degree of *tension* or resistance to compression by the fingers varies greatly: in a soft or 'low-tension' pulse the artery may be almost imperceptible between the beats; in a hard or 'high-tension' pulse it may be almost incompressible. An unduly soft pulse is usually an indication of

debility; an unduly hard one is most characteristic of arterial sclerosis associated with Kidney Disease (q.v.). The usual pressure required to obliterate the pulse in an adult is equal to about 120 mm. of mercury. In weakening illnesses it may fall below 100 mm., and in kidney disease may greatly exceed 200 mm. It is also raised by temporary causes like over-eating, and lowered similarly by a hot bath.

The force of the beats is a measure of the vigour and efficiency of the heart's action. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hypertrophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigour, so weakness of the pulse indicates debility. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. A pulse may be found in the veins of the neck and elsewhere when the right side of the heart is dilated, and valuable indications are got from it as to the state of this organ. See MEDICINE, CIRCULATION, HEART, PALPITATION; and especially *The Pulse*, by Dr Broadbent (1890).

Pulsometer. See PUMPS.

Pulzsky, FRANCIS AURELIUS (1814-97), Hungarian politician and author, was born at Eperies, studied law, and travelled, publishing (1837) a successful book on England. In 1848 he held various government posts of importance, but, suspected of sharing in the revolution, fled to London, where he wrote for the papers. When Kossuth came to England Pulzsky became his companion, and went with him to America (described in *White, Red, and Black*, 1852). His wife wrote *Memoirs of a Hungarian Lady* (Lond. 1850), and *Tales and Traditions of Hungary* (1851). He was condemned to death by the Austrian government in 1852, but, after living in Italy from 1852 to 1866, was pardoned in 1867. He sat in parliament, and was director of museums and libraries. His autobiographic memoirs (4 vols. 1879-82) were translated into German. See F. W. Newman, *Reminiscences of Two Exiles* (1889).

Pulteney, WILLIAM, Earl of Bath. This statesman, descended from a Whig family, was born in 1684, the son of Sir William Pulteney, member of parliament for Westminster. He was a student of Christ Church College, Oxford, where his oratorical power was early displayed. He entered parliament as member for Heydon, Yorkshire, and was a most graceful and brilliant speaker, full of epigram, and a master of all the arts of parliamentary attack. At first, and for many years, the friend and colleague of Walpole, he finally became so disgusted with that minister's indifference to his claims that in 1728 he placed himself at the head of a small group of malcontent Whigs styled the 'Patriots,' and was henceforth Walpole's bitterest and perhaps most formidable opponent, being the leader of the coalition against him in the Commons as Carteret was in the House of Lords. He was Bolingbroke's chief assistant in the paper called the *Craftsman*, which involved him in many political controversies, and called forth some of his finest pamphlets. In 1731 he wrongly ascribed to Lord Hervey the authorship of a scurrilous pamphlet; a duel was the consequence, fought with swords in St James's Park, when both combatants were slightly wounded. On the resignation of Walpole in 1741 Pulteney was sworn of the Privy-council, and soon afterwards created Earl of Bath; and from that time his popularity was gone. Horace Walpole places him amongst his *Royal*

and Noble Authors, but though his prose was effective and his verse graceful, he was probably still better known as the author of a once popular political song, 'The Honest Jury, or Caleb Triumphant,' than by his more serious writings. He died in 1764, a wealthy but disappointed man.

Pultowa, or POLTA'VA, a town of Ukraine situated on a tributary of the Dnieper, by rail 88 miles SW. of Kharkov and 449 NE. of Odessa. It manufactures tobacco and leather, and has important fairs. Pop. 88,000. The town is a bishop's seat, and is famous as the scene of Charles XII.'s defeat by Peter the Great on 8th July 1709.

Pultusk, a town of Poland, 32 miles N. of Warsaw. Here Charles XII. of Sweden defeated the Saxons in 1703, and here, too, on 26th December 1806, was fought a fierce battle between the Russians and the French, the latter being ultimately victorious. The town was destroyed by fire in 1875. Pop. 14,000.

Pulvermacher's Chains. See ELECTRICITY (MEDICAL).

Puma, or COUGAR (*Felis concolor*), a large Carnivore distributed in North and South America between 60° N. and 50° S. lat., but rare in those parts which have been long settled. It is sometimes called the American 'lion,' 'panther,' ('painter'), or 'catamount,' and is about the size of a leopard. The fur is thick and close, dark yellowish red above, lighter on the sides, and reddish white on the belly; the muzzle, chin, throat, breast, and insides of the legs are more or less white. But the colouring varies a little in different localities. Young pumas have dark-brown spots in three rows on the back, and scattered markings elsewhere. The long tail is covered with thick fur, and is slightly coiled. The pumas have very diverse haunts—the forest, the bush, and the grassy pampas; they have no fixed lairs, but roam about by night from place to place in search of prey. They are agile in their movements, and can leap and spring well, but swim only under compulsion. Many kinds of mammals fall victims to the pumas, and they are the more disastrous to flocks and herds because of their habit of killing many more than they devour. To the booty which they have secured but merely tasted they will afterwards return. They rarely attack man, but one puma has been known to kill fifty sheep in a night, drinking a little of the blood of each; hence their extermination in many regions. The two sexes live apart, but pair in winter and summer. Two or three young are born at once, and are left a good deal to themselves, though after the first birth the mothers are certainly affectionate. In spite of its restless and voracious instincts the puma may be readily tamed, and is said to become gentle. For a fine study of the puma, see W. H. Hudson, *Naturalist in La Plata* (1892).

Pumice, a general term for the cellular, spongy-form, filamentous, or froth-like parts of lavas. This highly porous and froth-like structure is due to the abundant escape of vapours through the rock while it was in a state of fusion. Under the microscope the rock is seen to be a glass, crowded with minute gas or vapour cavities and abundant crystallites. Owing to its porous structure pumice readily floats in water. It is usually a form of some highly acid lava, such as obsidian; but now and again basic lavas give rise to pumice (Canary Islands, Hawaii). The latter is dark brown or black, and often shows metallic tarnish; the former, which is much the more common, is white or gray, and sometimes yellow. It is a hard but brittle rock, and is much used for polishing wood, ivory, metals, glass, slates, marble, lithographic

stones, &c., in preparing vellum and parchment, and for rubbing away corns and callosities. Great quantities are exported from the Lipari Isles; and that from the quarries in the Peak of Teneriffe, 2000 feet above sea-level, is better and cheaper. Pumice occurs as the crust of some kinds of lava, and is often ejected in the form of loose cinders during volcanic eruptions. Sometimes immense quantities are thrown into the sea and are often floated for great distances. Eventually the cinders get water-logged and sink to the bottom. Abundant fragments were dredged up from abyssal depths by the *Challenger* expedition. After the eruption and earthquake in the Straits of Sunda in 1883, the seaport of Polok Batoung was closed with a barrier of pumice 19 miles long, two-thirds of a mile broad, and from 13 to 16 feet deep.

Pumpnickel, a kind of rye-bread (made of unbolted flour), much used in Westphalia. The etymology is disputed.

Pumpkin. See GOURD.

Pumps, machines for lifting liquids to a higher level, include (1) the Lift or Suction Pump, (2) the Lift and Force Pump, (3) the Pulsometer, (4) the Chain-pump, (5) Spiral Pumps, (6) the Centrifugal Pump, (7) the Jet-pump, (8) the Persian Wheel, (9) Scoop-wheels.

(1) *The Lift or Suction Pump* (fig. 1).—A is the cylinder (the 'barrel'), closed or open at the top; B is a pipe (the 'suction-pipe') communicating with the water to be raised; C is a 'discharge-pipe,' which may be reduced to a mere spout; D is a valve, opening upwards only; E is another valve, also opening upwards only, and borne by F; F is the 'bucket,' a hollow cylindrical piece of wood or metal which is made, by leather or by hemp or other packing, to fit the barrel just so closely that water cannot travel between the bucket and the barrel; G is the piston-rod, driven by hand, steam, windmill, or animal power, and moving the bucket up and down in the barrel. Each upward stroke of the piston at first lifts air, of which none can travel back past the bucket; a partial vacuum is produced in B; water ascends in B until the external atmospheric pressure is balanced by the partial atmospheric pressure below D plus the weight of the water column in B; as F now descends, air gets to the upper side of the valve,

Fig. 1.

and is lifted on the upstroke, and so on; so that, if the valve D be not more than at most 33 feet above the water below (in practice 25 feet or less), water will be, step by step, pushed up B by the external atmospheric pressure until the valve D is under water; thereafter the succeeding strokes of the pump operate on the water above D and force it into the discharge-pipe, C, the external atmospheric pressure keeping the space below D filled with water. The power expended is applied (1) in lifting water; (2) in overcoming the pump-friction; (3) in overcoming the water-friction; and, (4) where the pump is ill-shaped, in producing

eddies and broken water. A lift-pump must be very carefully proportioned and constructed in order to utilise, in water-lifting, one-half of the whole power expended in working it. Such pumps must work slowly, so that the valves may close properly; and an air-vessel is, if C be not a mere spout, required on C so as to minimise shock and render the outflow less intermittent, by the compression and elastic expansion of the air contained in it. The outflow is also regulated by driving two or three pumps off the same shaft and properly timing their relative motions.

(2) *The Lift and Force Pump* (fig. 2).—The piston is solid, and the valve E, instead of being carried by the piston, is fitted in the discharge-pipe. During the downward motion of the piston water is forced past the valve E; it cannot return;

Fig. 2.

Fig. 3.

and water may thus be forced to considerable heights. Sometimes (fig. 3) the piston is made to fit, not the barrel, but the stuffing-box, B, which can be tightened down on it so as to make the fit good. An air-vessel, or a loaded hydraulic press called an 'accumulator,' is fitted on the discharge-pipe so as to minimise shock and intermittence; and double pumps are very generally employed, either directly driven by steam-engine pistons or driven by a flywheel. Force-pumps are used for deep wells and mines, hydraulic presses, boiler feeds, creosoting timber, hydraulic lifts, steam fire-engines both land and marine, and hydraulic power supply.

(3) *The Pulsometer.*—Two chambers, A and B, converge above and communicate with a single steam-pipe; a ball-valve shuts off either A or B, but not both at the same time, from the steam; A and B each have a discharge outlet and a suction inlet, both these having valves. The whole is filled with water; the steam drives water from, say, A into the discharge-pipe; condensation takes place and the ball-valve is pulled over, so as to shut off the steam from A: the steam then acts in B in the same way as it had done in A, while in the meantime A, where there is a partial vacuum, is being filled with water from the suction-pipe. The two chambers thus act alternately. The whole contrivance can be hung by chains and let down to the required position; and it is greatly in use in contractors' work.

(4) *The Chain-pump.*—This pump is formed of plates called lifts or buckets, fastened, now generally by their centres, to an endless chain and moving upwards, in a case or 'barrel' which is in

places constricted so as just to let the buckets pass. Chain-pumps are noisy and somewhat apt to break down; but they can lift very gritty or muddy material. The Dredger (q.v.) with its buckets is a variety of this device.

(5) *Spiral Pumps*.—An Archimedes' Screw (q.v.) is rotated round its axis so as to make water slip up the inclined plane of the screw. They are very economical in power, and they work so regularly that they act as meters.

(6) *Centrifugal Pumps* (figs. 4 and 5).—The water enters by the supply-pipes, A, A, which lead to the central orifices of the fan, B, B; it then traverses the passages, C, C, formed by the vanes and the side covering-plates, D, of the fan. The fan is made to rotate from the shaft, E. The water acquires a rotatory motion while passing through the passages of the rotating fan; it then enters the whirlpool-chamber, F, and is discharged by the pipe, G, at the circumference of F; and the velocity of

Fig. 4.

rotation of the fan determines the height to which the water will rise in the discharge-pipe. This velocity cannot conveniently be made to exceed a certain limit; hence the utility of centrifugal pumps is practically limited to low lifts; but as they can be made very large they can deal with enormous quantities of water; and they are much

used for pumping in docks, canals, marsh and polder draining, land-reclaiming, and the like. As they have no valves they are little liable to become choked. In nearly all modern centrifugal pumps the whirlpool-chamber, F, the purpose of which was to reduce the ultimate velocity of outflow and correspondingly to increase the pressure, is dispensed with; and the same end is attained without wasting energy through friction in the vortex, F, by shaping the vanes of the fan so as to reduce the velocity. See Cotterill's *Applied Mechanics*.

(7) *The Jet-pump*, now not much used, is practically a Giffard's Injector (q.v.) worked by water from a height instead of by steam.

(8) *The Persian Wheel*.—An under-shot wheel

(mill-wheel in which the water flows under the wheel) in which little buckets are carried by the rim of the wheel so as to pick up water from the stream and deliver it at the top of the wheel.

(9) *Scoop-wheels* or flash wheels: equivalent to breast water-wheels with reversed action; driven by windmills or by steam, they raise water in their buckets and deliver it a few feet higher up; in some cases they have curved blades, and the water is delivered at the centre of the wheel.

See *Pumps and Pumping Machinery*, by Frederick Colyer, C.E. (Lond. 1886); also see AIR-PUMP.

Pun, the name given to a play upon words that agree or resemble each other in sound but differ in sense, a verbal quibble by means of which an incongruous and therefore ludicrous idea is unexpectedly shot into the sentence—as, for example, in the answer to the grave question, 'Is life worth living?'—'That depends on the liver.' We find this form of witicism in Aristophanes and Cicero, and in old England it was not unknown even in the pulpit. The sermons of Bishop Andrewes and the *Church History* and other works of Thomas Fuller abound in puns of all degrees of goodness and badness; they meet us strangely enough even in the gravest situations in the tragedies of Shakespeare, and there is at least one in Liddell and Scott's *Greek Lexicon*. Dr Johnson said that the man who would make a pun would pick a pocket; but this sentence bears too hard upon the best beloved of English writers, Charles Lamb, a hardened punster, not to speak of Sydney Smith, Hook, Hood, the prince of punsters, and Bishop Wilberforce. Boswell, while relating Dr Johnson's dislike to puns, ventures his own opinion that 'a good pun may be admitted among the smaller excellencies of conversation.' But a pun of the best kind has a value infinitely higher than this: there is tenderness as well as wit in Fuller's phrase of the Holy Innocents of Bethlehem—'the *infantry* in the noble army of martyrs.'

See *Spectator*, No. 61, L. Larchey's *Les Joueurs des Mots* (1866), and Holmes's *Autocrat of the Breakfast Table*. The Hon. Hugh Rowley's *Puniana* (1867) and *More Puniana* (1875) contain many hundred examples, among them a few good puns.

Puna. See POONA; also ANDES, PERU, WIND.

Punch, a beverage introduced into England from India, possibly so called from being usually made of five (Hindi, *punch*) ingredients—arrack, tea, sugar, water, and lemon-juice. As now prepared, punch is a drink the basis of which is alcohol of one or more kinds (especially rum), diluted with water, flavoured with lemon or lime-juice and spices, and sweetened with sugar; sometimes other ingredients are added according to taste, especially wine, ale, and tea. 'Rack-punch' takes its name from Arrack (q.v.). Milk-punch is prepared beforehand (of rum and brandy with milk), bottled, and served cold—even iced. Whisky-toddy, made with whisky, hot water, and sugar, is a kind of punch, the name *toddy* being Hindustani.

Punch, with his wife Judy (earlier Joan) and dog Toby, the chief character in a popular comic puppet-show of Italian origin, the name being a contraction of Panchinello, for Pulcinello, the droll clown in Neapolitan comedy. The word is perhaps from Neapolitan *pollecenella*, 'a young turkey-cock.' Some believe the modern Punch to have originated in a survival of the Macens, the fool or clown of the ancient Atellanæ (q.v.), as Arlecchino and Brighetta of other Oscan characters. The line of descent is certainly obscure enough, but possibly some trace of the old *Ludi Osci*, transmitted through the Vice of the mystery plays, may lurk in the modern drama of the hook-nosed hunchback and his unfortunate wife. The full-grown modern drama,

which can scarcely be looked on as a school of the domestic virtues, seems to belong to the end of the 18th century. The older Punch and Judy shows were not confined to one story. The exhibition soon found its way from Italy into other countries, and was very popular in England during the 17th century. Its popularity seems to have reached its height in the time of Queen Anne, and Addison has given in the *Spectator* a regular criticism of one of the performances. The movements of the puppets are managed simply by putting the hands under the dress, making the second finger and thumb serve for the arms, while the forefinger works the head. Formerly wires were sometimes used. See MARIONETTES.

Punch, or the LONDON CHARIVARI, the English comic journal *par excellence*, is a weekly magazine of wit, humour, and satire in prose and verse, copiously illustrated by sketches, caricatures, and emblematical devices. It draws its materials as freely from the most exalted spheres of foreign politics as from the provincial nursery; and, dealing with every side of life, is not less observant of the follies of Belgravia than of the peculiarities of Whitechapel. *Punch* gives due place to Irish bulls and dry Scotch humour, and does its best to present them in the raciest vernacular. Stern in the exposure of sham and vice, *Punch* is yet kindly when it makes merry over innocent foibles. Usually a *censor morum* in the guise of Joe Miller, a genial English Democritus who laughs and provokes to laughter, *Punch* at times weeps with those that weep, and, *jocis remotis*, pays a poetical tribute to the memory of the departed great. The wittiest of serial prints was founded in 1841, the first number appearing on the 17th July of that year, and, under the joint editorship of Henry Mayhew and Mark Lemon, soon became a household word, while ere long its satirical cuts and witty rhymes were admittedly a power in the land. *Punch* is recognised as an English institution, and in corners of Europe where an Englishman rarely comes the frequenters of the café may be seen puzzling over the esoteric wit and wisdom of Cockayne. Their contributions to *Punch* helped to make Douglas Jerrold, Gilbert & Beckett, Tom Hood, Albert Smith, Thackeray, Shirley Brooks, Tom Taylor, F. C. Burnand, Owen Seaman, E. V. Knox, and A. A. Milne famous; as their illustrations did H. K. Browne, Doyle, Leech, Tenniel, Du Maurier, Keene, Linley Sambourne, Furniss, and Partridge. It should be noted that this genial comic paper has done memorable service in purifying the moral standard of current wit in England.

See CHARIVARI, CARICATURE, the articles on the chief contributors, &c.; *A Jorum of Punch*, by Athol Mayhew, rather unduly magnifying Mayhew's share (1895); and *The History of Punch*, by M. H. Spielmann (1895).

Punctuation is the art of marking the divisions of a sentence by means of conventional signs—the full stop or period (.), colon (:), semicolon (;), comma (,), dash (—), mark of exclamation (!), mark of interrogation (?), inverted commas (" "), and brackets—(), []. Broadly speaking, there are two principal systems of punctuation, the grammatical and the logical, but practical experience is the best teacher. In theory little more can be done than to lay down a few general maxims for guidance.

Use commas and semicolons sparingly, especially commas; use them, indeed, only where they are absolutely necessary. The sentence should stand on its own feet, not rest upon a long array of comma crutches. It is not as a general rule necessary to set commas to fence or adorn every adverbial clause. Especial care is required in punctuating sentences that contain relative clauses. If the relative clause gives additional information, separate it by a

comma or commas; if it belongs essentially to the structure of the thought expressed by the main clause, put no comma. For example, in 'the man who had an impediment in his speech,' written without the comma, the relative clause points out this particular man and distinguishes him from some other or others who have been also spoken of: it fulfils in fact the function of an article or demonstrative pronoun. In the same sentence printed with the comma, 'the man, who had,' &c., the relative clause gives an entirely new piece of information, and is no longer demonstrative. The colon is generally put before a long quotation. Some would confine the use of it to this and to one other case—namely, to part a general statement from the immediately following particular application of it or exemplification of it in detail. Dashes are commonly employed to indicate a sudden break or change in the grammatical structure or the logical development of the sentence. A dash may precede an enumeration of mere names or dates or objects expressed in very brief terms. One dash may also be put before and one after a short clause that merely explains in other words or makes clearer a statement that has just been made; both dashes, and not one dash and some other stop, should be used, except where the second would fall at the end of a sentence. But for this purpose, especially where the parenthetical nature of the added explanatory clause is more prominent, brackets are frequently employed. Semicolons are most appropriately used in compound sentences or sentences that embrace antithetical statements. In the former class of sentence they should mark off the subordinate sentences from the main sentence or co-ordinate sentences from one another; in the latter class they should separate the antithetical sentences, which generally begin with 'but' or some equivalent. The mark of exclamation has another besides its legitimate use: it is frequently put after absurd or highly improbable statements. The mark of interrogation too has a secondary use: placed in brackets immediately after a word it throws doubt upon its correctness, either as according with fact or as being philologically or grammatically correct.

Pundit (Hindi, *pandit*; Skr. *pandita*, 'a learned man'), in India a teacher, especially a Brahman learned in Sanskrit and in Hindu literature, law, and religion. Of late native pundits have done good service as geographical explorers in districts, such as Tibet, not accessible to Europeans.

Pungwe, a river of Portuguese East Africa, forming the principal waterway to Manicaland and Mashonaland; its mouth is situated some 25 miles NE. of Sofala and 130 SW. of the Zambezi delta. After some diplomatic difficulties between Britain and Portugal, it was agreed (1891) by Portugal that British commerce should have unimpeded access by this route to the British sphere in the interior, the Pungwe being made freely navigable. In 1899 the railway from Beira (q.v.) at its mouth reached Salisbury (375 miles), and in 1902 Bulawayo.

Punic Wars. See CARTHAGE.

Punishment will be found described in the articles in this work on Criminal Law, Imprisonment, Prisons, Flogging, Execution, Pillory, &c., See also the description of Tortures, Boot, Guillotine, Thumb-screw, Branks, Jongs, Ducking-stool, Stocks, &c.; the articles on the several crimes; Andrews, *Old-time Punishments* (1891); and Ives, *History of Penal Methods* (1914). Future punishment is treated in the article HELL.

Punjab, or PUNJAB (*pánj-ab*, 'five rivers'; the *Pentapotamia* of the Greeks), a province of north-

west India, is watered by the Indus and its five great affluents—the Jhelum, Chenab, Ravi, Beas, and Sutlej. It lies between the North-west Frontier Province and the United Provinces of Agra and Oudh and between Kashmir and Agra. Before the formation—largely out of the Punjab—of the North-west Frontier Province, it had an area of 148,966 sq. m. and a pop. (1891) of 25,130,127; (1901) 26,888,300. These totals were reduced by the execution of the Frontier Province, and in 1912 of Delhi (not entirely separated for administrative purposes) to 136,332 sq. m. and 25,101,060 inhabitants, 4,416,036 being in the numerous Indian states. The capital is Lahore. Amritsar is the religious capital of the Sikhs. The whole of the northern parts are traversed by spurs from the Himalayas, which enclose deep valleys. On the west the Sulaiman Mountains run parallel to the Indus. In the south the surface is not broken by any important eminence, except the Salt Range, varying from 2000 to 5000 feet high, between the Indus and the Jhelum. The country, divided into six doabs, or interfluvial tracts, and frequently spoken of as the plains of the Indus, has a general slope towards the south-west. The climate in the plains is most oppressively hot and dry in summer, reaching in May 87°-4° to 116°-6° F. in the shade at several stations; but is cool, and sometimes frosty, in winter. Little rain falls except in the districts along the base of the Himalayas. The soil varies from stiff clay and loam to sand; but, in general, is sandy and barren, intermixed with fertile spots. Rivers and canals afford ample means of irrigation. The indigenous vegetation is meagre. Trees are few and small, and fuel is so scarce that cow-dung is much used. Wheat of excellent quality is produced in considerable quantities, and indigo, sugar, cotton, tobacco, opium, tea, rice, barley, millet, maize, and numerous vegetables and fruits are grown. The manufacturing industry—cottons, wood-work, iron, leather, gold and silver lace, silk, and shawls—is very considerable, and is carried on for the most part in the great towns, as Amritsar, Lahore, Multan. Punjab exports indigo, grain, salt, metals, spices, tea, tobacco, manufactured cottons, hides, and leather to Kabul, Kashmir, Turkestan, and Tibet; and imports dyes, goats' wool, raw silk, fruits, ghi, horses, furs, timber, and shawl cloth. The inhabitants are of various races, chiefly Sikhs, Jats, Rajputs, and Pathans. Of the whole population, about 50 per cent. are Mohammedans; Hindus constitute above 35 per cent.; and Sikhs about 12 per cent. The Jats are the most prominent race, and are said to have formed the 'core and nucleus' of the Sikh nation and military force. For the history of the Punjab, see SIKHS. Remains of a great prehistoric culture (about the 3rd millennium B.C.) have been found in the Punjab and in Sind.

Punkah, a gigantic fan for ventilating apartments, used in India and tropical climates. It consists of a light frame of wood, covered with calico, from which a short curtain depends, and is suspended by ropes from the ceiling; another rope from it passes over a pulley in the wall to a servant stationed without; the servant pulls the punkah backwards and forwards, maintaining a constant current of air in the chamber.

Puno. See PERU.

Punt, a heavy, oblong, flat-bottomed boat, useful where stability and not speed is needed. Punts are much used for fishing and wild-fowling. Some are fitted for oars; but the more usual mode of propulsion is by poles operating on the bottom.

Punta Arenas, (1) the chief port of Costa Rica on the Pacific, stands on a 'sandy point'

utting into the Gulf of Nicoya, and is connected by railway with Esparza, 14 miles east-north-east. The principal export is coffee, and after that india-rubber, hides, dye-woods, and tortoiseshell. Pop. 6000.—(2) A town in Chilean Patagonia (q.v.), once a convict station, with trade in wool and frozen meat. Pop. 20,000.

Pupa (Lat., 'a doll'), the stage which intervenes between the larva and the adult in the life of insects with complete metamorphosis. *Chrysalis*, *aurelia*, *nymphe* are almost synonymous terms, but *pupa* is more general and is sometimes applied to stages in the metamorphosis of other animals besides insects (q.v.).

Pupil. See INFANT, and EYE.

Puppet. See MARIONETTES, PUNCH.

Purāṇa, 'of olden time', occurs in the later Vedic literature as the name of a form of legendary lore, but no text of an early date has been preserved. In Sanskrit literature there are a large number of works, styled either Purāṇas, a list of eighteen being often given, or Upapurāṇas, which may contain some of the matter of the older texts, but which in their present shape are probably none of them older than 500 A.D.; moreover, the text in many cases is much interpolated and uncertain. Their contents are miscellaneous, but legends of creation, of the deeds of the gods, of holy places, and of pious sages, and directions for divine worship, pilgrimages, &c., predominate. It is probable that in their present form the Purāṇas, and still more the Upapurāṇas, represent the work of temple priests eager to glorify the god whom they served, and to attract worshippers to his shrine. While they are catholic in their recognition of the whole pantheon of Hindu gods, each is usually devoted to extolling the pre-eminence of some special deity—Śiva or his consort Devī, Viṣṇu, Kṛiṣṇa, Gaṇeśa, Śārya, &c. Together with the Tantras (q.v.) they represent the foundations on which modern Hindu religion is based, having superseded the Vedas (q.v.), and being regarded by tradition as the composition of the sage Vyāsa, the supposed arranger of the Vedas. Some of them contain, under the guise of prophecy, a limited amount of historical matter in a very inaccurate form. They show many points of contact with the *Mahābhārata* (q.v.) and its appendix the *Harivaṃśa*, and are doubtless later than both. Among the best known are the *Vāyu*, the *Viṣṇu*, the *Bhāgavata*, the *Mārkaṇḍeya*, and the *Matsya*, while the *Skanda* is remarkable for the large number of independent sectarian tracts attributed to it.

See VISHNU, SANSKRIT LITERATURE; J. Muir, *Original Sanskrit Texts* (1858-84); the *Viṣṇu Purāṇa*, trans. by H. H. Wilson (2d ed. by F. Hall, 1894-77); the *Bhāgavata Purāṇa*, ed. with French trans. by E. Burnouf and M. Haugvete-Besnault, 1840-98; the *Mārkaṇḍeya Purāṇa*, trans. by F. E. Pargiter, 1888-99; M. Winternitz, *Geschichte der indischen Literatur*, Vol. I. (1908).

Purbeck, ISLE OF, a peninsular district of Dorsetshire, 12 miles long and 5 to 9 broad, is bounded N. by the river Frome and Poole Harbour, E. and S. by the English Channel, and W. by the little stream of Luckford Lake, which runs from Lulworth Park to the Frome. The coast is bold and precipitous, with St Albans Head, 360 feet high; inland a range of chalk downs curves east and west, attaining a maximum height of 655 feet. The geology of the 'isle' is very interesting. The Purbeck Beds are a group of strata forming the upper members of the Jurassic System (q.v.); the Purbeck Marble, belonging to the upper section of these, is an impure fresh-water limestone, composed almost wholly of the shells of *Paludina carinifera* (see DIRT-BEDS). Nearly a hundred quarries are worked; and the quarrymen still form

a curious kind of trades' guild. Of old the 'isle' was a royal deer-forest. Swanage and Corfe Castle are the chief places.

Purcell, HENRY, the most eminent of English musicians, was born at Westminster in 1658, and was son of Henry Purcell, one of the gentlemen of the Chapel Royal appointed at the Restoration. He lost his father at the age of six, and was indebted for his musical training to Cooke, Humfrey, and Dr Blow. His compositions at a very early age gave evidence of talent. In 1680 he was chosen to succeed Dr Christopher Gibbons as organist of Westminster Abbey; and in 1682 he was made organist of the Chapel Royal. He wrote numerous anthems and other compositions for the church, which were eagerly sought after for the use of the various cathedrals, and have retained their place to the present day. Purcell's dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his opera *Dido and Aeneas*, written at the age of seventeen, his music to the *Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to D'Urfey's *Don Quixote*, &c. A great many of his cantatas, odes, glees, catches, and rounds are yet familiar to lovers of vocal music. In 1683 he composed twelve sonatas for two violins and a bass. Purcell studied the Italian masters deeply, and often made reference to his obligations to them. In originality and vigour, as well as richness of harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His style foreshadows that of Handel. His church music was collected and edited from the original MSS. by Vincent Novello, in a folio work which appeared in 1829-32, with a portrait and essay on his life and works. A complete edition of his works, many of which are still in MS., was undertaken by the Purcell Society, instituted in 1876. Purcell died of consumption in 1695. See J. F. Runciman, *Purcell* (1909).

Purchas, SAMUEL, was born at Thaxted in Essex in 1577, and educated at St John's College, Cambridge. He was presented by the king in 1604 to the vicarage of Eastwood, which he soon resigned to his brother, as the chosen labour of his life required residence in London. Later he became rector of St Martin's, Ludgate, and chaplain to Archbishop Abbot, and died in September 1626, if not in a debtor's cell, yet in difficulties. His great works were *Purchas his Pilgrimage, or Relations of the World and the Religions observed in all ages* (1613; 4th ed. much enlarged, 1626), and *Hakluytus Posthumus, or Purchas his Pilgrimage: containing a History of the World, in Sea Voyages and Land Travels by Englishmen and others* (4 vols. folio, 1625). The fourth edition of the former usually accompanies the latter as if a fifth volume, although a quite distinct work. Purchas himself thus describes the two books: 'These brethren holding much resemblance in name, nature, and feature, yet differ in both the object and the subject. This [*the Pilgrimage*] being mine own in matter, though borrowed, and in form of words and method; whereas my *Pilgrimes* are the authors themselves, acting their own parts in their own words, only furnished by me with such necessities as that stage further required, and ordered according to my rules.' Another work is *Purchas his Pilgrim: Microcosmus, or the History of Man; relating the wonders of his Generation, vanities in his Degeneration, and necessity of his Regeneration* (1619).

Purchase-system. See COMMISSIONS.

Purfleet, a village of Essex, on the north bank of the Thames, 15 miles by rail E. by S. of London and 8 miles E. of Woolwich, contains government powder-magazines, built in 1781.

Purgation. See ORDEAL.

Purgatives. See APERIENTS, CONSTIPATION.

Purgatory (Lat. *purgatorium*, from *purgo*, 'I cleanse') is the name given to a place of purgation, in which, according to the Roman Catholic and Oriental churches, souls after death either are purified from venial sins (*peccata venialia*) or undergo the temporal punishment which, after the guilt of mortal sin (*peccata mortalia*) has been remitted, still remains to be endured by the sinner (see ATONEMENT). The ultimate eternal happiness of their souls is supposed to be secured; but they are detained for a time in a state of purgation, in order to be fitted to appear in that Presence into which nothing imperfect can enter. Catholics hold as articles of their faith (1) that there is a purgatory in the sense explained above, and (2) that the souls there detained derive relief from the prayers of the faithful and from the sacrifice of the mass. The scriptural grounds alleged by them in support of this view are 2 Macc. xii. 43-46, Matt. xii. 32, Luke, xii. 48, 1 Cor. iii. 11-15, 1 Cor. xv. 29; as well as certain less decisive indications contained in the language of some of the Psalms. And in all these passages they argue not alone from the words themselves, but from the interpretation of them by the Fathers. The direct testimonies cited by Catholic writers from the Fathers are very numerous, from the days of Clement and Origen down; amongst the Latins Augustine being one of the most important (though at times he speaks doubtfully); in Gregory the Great the doctrine is found in all the fullness of its modern detail. The epitaphs of the catacombs, too, supply Catholic controversialists with some testimonies to the belief of a purgatory, and of the value of the intercessory prayers of the living in obtaining not merely repose, but relief from suffering, for the deceased; and the liturgies of the various rites are still more decisive and circumstantial. Beyond these two points Catholic faith, as defined by the Council of Trent, does not go; and the council expressly prohibits the popular discussion of the 'more difficult and subtle questions, and everything that tends to curiosity, or superstition, or savours of filthy lore.' As to the existence of purgatory Greek and Latin churches are agreed; and they are further agreed that it is a place of suffering; but, while the Latins commonly hold that this suffering is 'by fire,' the Greeks do not determine the manner of the suffering, but are content to regard it as 'through tribulation.' The decree of union in the Council of Florence (1439) left this point free for discussion. Equally free are the questions as to the situation of purgatory; as to the duration of the purgatorial suffering; as to the probable number of its inmates; as to whether they have, while there detained, a certainty of their ultimate salvation; and whether a particular judgment 'is passed on every one immediately after death. For Patrick's Purgatory, see DEMO (LORÉN).

The mediæval doctrine and practice regarding purgatory were among the leading grounds of the protest of the Waldenses and other sects of that age. The Reformers as a body rejected the doctrine. Protestants generally reply to the arguments of Roman Catholics on the subject of purgatory by refusing to admit the authority of tradition or the testimonies of the Fathers, and at the same time by alleging that most of the passages quoted from the Fathers, as in favour of purgatory, are insufficient to prove that they held any such doctrine as that now held by the Roman Catholic Church, some of them properly relating only to the subject of prayer for the dead (see PRAYER), and others to the doctrine of Limbo (q.v.). That the doctrine of purgatory is the fair

development of that which maintains that prayer ought to be made for the dead, Protestants generally acknowledge. As to the alleged evidences from Scripture, they are commonly set aside by Protestants as irrelevant or wholly insufficient to support such an inference. The doctrine of purgatory in its historical connection with other eschatological doctrines is touched on in the article **HELL**.

Purgstall. See **HAMMER-PURGSTALL**.

Puri. See **JAGANNÁTH**.

Purification. See **ABLUTION**, **CHURCHING OF WOMEN**, **FIRE**, **HOLY WATER**, **LUTRUM**, **TABU**.

Purification of the Blessed Virgin Mary. **FEAST OF**, a festival in commemoration of the 'purification' of the Blessed Virgin Mary, in accordance with the ceremonial law of Lev. xii. 2. This ceremony was appointed for the fortieth day after childbirth, which, reckoning from 25th December (the nativity), falls upon 2d February, on which day the purification is celebrated. The history of Mary's compliance with the law is related in Luke, ii. 22-24. The date of the introduction of this festival is uncertain. The first trace of it is about the middle of the 5th century, and in the Church of Jerusalem. In the Western Church it was known to Bede. Its introduction in the Roman Church in 494 was made by Pope Gelasius the occasion of transferring to a Christian use the festivities which at that season were annexed to the pagan festival of the Lupercalia. See **CHURCHING OF WOMEN**.

Purim, a Jewish secular rather than religious feast, in honour of the deliverance of the nation, recorded in the Book of Esther, held on 14th to 15th Adar. Apparently it spread but slowly; still Josephus tells us that by his time it was observed over all the Jewish world. Its origin is still disputed. See especially Frazer, *Golden Bough*, pt. vi. (the Scapcegoat, pp. 361 *seq.*), and the commentaries on Esther (q.v.).

Puritans, a name first given, according to Fuller, in 1564, and according to Strype in 1569, to those clergymen of the Church of England who refused to conform to its liturgy, ceremonies, and discipline as arranged by Archbishop Parker and his condisciples. The history of Puritanism within the Church of England is sketched at **ENGLAND (CHURCH OF)**. In spite of the sharpest repressive measures, the principles of the party amongst the clergy who believed that the church did not separate itself markedly enough from Roman Catholicism and needed further reformation gradually spread among the serious portion of the laity, who were also called Puritans. But the name appears not to have been confined to those who wished for certain radical changes in the forms of the church. The character that generally accompanied this wish led naturally enough to a wider use of the term: hence, according to Sylvester, 'the vicious multitude of the ungodly called all Puritans that were strict and serious in a holy life were they ever so conformable.' This is the sense in which the Elizabethan dramatists use the word. From this very breadth of usage one sees that there were different degrees of Puritanism. Some would have been content with a moderate reform in the rites, discipline, and liturgy of the church; others (like Cartwright of Cambridge) wished to abolish Episcopacy altogether, and to substitute Presbyterianism; while a third party, the Brownists or Independents, were out-and-out dissenters, opposed alike to Presbyterianism and Episcopacy. During the reigns of James I. and Charles I. the spirit of Puritanism continued more and more to leaven

English society and the English parliament, although the most violent efforts were made by both monarchs to extirpate it. Up till the time of the Synod of Dort (1618-19) both the Puritans and their opponents in the church had been substantially Calvinist; the strong tendency towards Arminianism amongst churchmen raised a new ground of controversy between the Puritans and the other sections of the church, both Laudian and Latitudinarian. The policy of Laud and the outrages practised by Charles on the English constitution led many who were not at all Genevan in their ideas to oppose both church and king for the sake of the national liberties. In the memorable 'Westminster Assembly of Divines' (1643) the great majority of the ministers were Presbyterians. But the more advanced Puritans, who were predominant in the army and the parliament, ultimately triumphed in the person of Cromwell (q.v.). The Restoration (1660) brought back Episcopacy, and the Act of Uniformity (1662) threw the Puritans of the church into the position of dissenters. Their subsequent history is treated under the different forms of dissent. Before the Civil War broke out so great were the hardships to which the Puritans were exposed that many of them emigrated to America, to seek liberty and peace on the solitary shores of the New World. There they became the founders of the New England states, and cultivated unmolested that form of Christianity to which they were attached. Nowhere did the spirit of Puritanism in its evil as well as its good more thoroughly express itself than in Massachusetts. In Scotland Puritanism dates rather from the 'Second Reformation' of 1638 than from the Reformation of 1560.

See Neal's *History of the Puritans* (ed. Toulmin, 1822); the histories by Stowell (1849; new ed. 1878) and Marsden (1850); H. W. Clark, *The History of English Nonconformity* (1911 *et seq.*); J. Gregory, *Puritanism in the Old World and the New* (1896); Ellis, *Puritan Age in Massachusetts* (Boston, 1888); several of the works cited under S. R. GARDINER; Professor Dowden's *Puritan and Anglican* (1901); A. MacPhail, *Essays in Puritanism* (1905); J. Crouch, *Puritanism and Art* (1910); G. B. Tatham, *Puritans in Power, 1640-60* (1913); A. P. Newton, *Colonising Activities of the English Puritans* (1914); J. S. Flynn, *Influence of Puritanism on Political and Religious Thought* (1920); St J. D. Seymour, *Puritanism in Ireland, 1657-61* (1921); the articles in this work on INDEPENDENTS, BROWNE, PRESBYTERIANISM, WESTMINSTER ASSEMBLY, PRYNN, MARPRELATE, HAMPTON COURT, SMECTYNNUS; on ELIZABETH, JAMES I., CHARLES I., CROMWELL, MILTON; on LAUD, PARKER, GRINDAL, WHITGIFT; and on the Puritans HOWE, BAXTER, OWEN. In Nichol's edition of the *Puritan Divines* (26 vols. 1861 *et seq.*) other names included are those of Manton, Adams, Goodwin, and Clarkson.

Purkinje's Figure, named after the physiologist J. E. Purkinje (1787-1869), professor at Breslau and at Prague; see **EYE**.

Purl, a beverage made by warming a pint of ale with a quarter of a pint of milk, and adding sugar and a wine-glassful of gin, rum, or brandy.

Purniah, a town of British India, in the province (Bihar and Orissa), 230 miles NNW. of Calcutta, has a trade in jute. Pop. 14,000.

Purple Colours. Painters in oil and water colours produce various shades of purple by mixing certain red and blue pigments. For work in oil French ultramarine, often called French blue, is mixed with vermilion or some madder red (madder carmine is best), or one of these reds with cobalt blue if a pale purple is wanted. For permanent purples in water-colours the same blues are used; but one of the madder reds, not vermilion, should be mixed with them. A much richer purple than any of the above mixtures will give is pro-

duced by Prussian blue and one of the lakes from cochineal—viz. carmine or crimson lake—but it is not permanent. This purple, as well as that obtained by mixing Indian red with indigo, also fugitive, was much used by water-colour painters in past years. Purple madder is the only simple purple pigment available for the artist which is durable, and it is unfortunately costly. All purples are changed to neutral and gray tints by the addition of any yellow pigment. For house-painting moroon lake with a little French blue gives a useful purple; but some of the above mixtures also are occasionally used.

There are several ways of dyeing textile fabrics of a purple colour. The most famous of all ancient dyes was the Tyrian purple, which is said to have been discovered at Tyre many centuries before the Christian era. Among the Romans this colour was exclusively employed for dyeing the imperial robe. It was obtained from shellfish belonging to the genera *Murex*, *Purpura*, and *Buccinum*; at least it has been supposed that it was prepared from one or more species of each of these. The colour was so costly that in the time of Augustus one pound of it sold for what would amount to £36 sterling. About the year 1851 what is believed to be the same or a closely similar purple was obtained from uric acid by a peculiar treatment (see *MUREX*, *DYEING*, and *PHENICIA*). Archil (q.v.) seems to have been the only simple purple dye known in the middle ages. Purple of Cassius is a compound of gold and tin used in colouring glass (q.v.), and in porcelain and enamel painting. It was discovered at Leyden by Andrew Cassius about 1683. A preparation of this colour was formerly used for painting miniatures in water-colour.

Purple Emperor (*Apatura iris*), one of the largest of British butterflies, and one of the most richly coloured.

Purple Emperor.

The expanse of wings is from 2½ to 3½ inches. The wings are strong and thick, and the flight is very vigorous. The male flies especially high, and will perch on lofty trees. The caterpillar is green and feeds on sallow.

Purples.
See WHEAT, PURPURA.

Purple Wood, or **PURPLE HEART**, the heart-wood of *Copaifera pubiflora* and *C. bracteata*, a very handsome wood of a rich plum colour. The trees are natives of British Guiana.

Purpura, a genus of marine Gasteropods, from some species of which (e.g. *P. patula*), as well as from *Murex*, the famous Tyrian purple dye was derived. *P. lapillus* (the Dog Whelk) is common on most British coasts, and from it also the dye is procurable. See WHELK.

Purpura, or **THE PURPLES**, is a malady which is often erroneously placed amongst the diseases of the skin. It is in reality a blood disease, and is characterised by the appearance of small round spots, of a deep purple colour, which are seen first and most abundantly on the legs, and afterwards extend to the arms and trunk. They are accompanied by no local pain, are not effaced by pressure (being due to a drop of blood extravasated beneath the cuticle or in the structure of the skin itself), do not rise above the surrounding surface, and are sometimes intermixed with livid patches resembling

bruises; and, before disappearing, both the round spots and the patches undergo the same change of colour which a bruise undergoes. These spots are not peculiar to the skin, but occasionally occur upon internal surfaces and in the tissues of viscera. Passive hemorrhages from the mucous membranes frequently accompany the external symptoms. There is usually much debility, and often a great tendency to faintness. The duration of the disease varies from a few days to a year or more. Slight cases are devoid of danger, and even the hemorrhagic cases usually recover, unless the bleeding has been excessive or the blood has been extravasated into a vital organ.

Precisely similar appearances occur in the course of other diseases, especially scurvy, severe anemia, scarlet fever, cerebro-spinal fever, and smallpox. But the name purpura should be restricted to the cases in which no such disease is discoverable.

The causes of purpura are obscure. The treatment which succeeds best varies in different cases, but the main indication always is to correct the condition of the blood. Astringent, turpentine, and various hemostatic sera are the drugs which are generally most beneficial; rest in bed, light diet, and laxatives are desirable at the commencement. When there is reason to believe that the disease is dependent upon depressing influences a nutritious diet, tonics, and stimulants are required; but chalybeates should be avoided. If the hemorrhage proceeds from accessible parts, local measures, such as the use of strong astringents like lead and opium lotion, should also be had recourse to.

Purser, the name formerly given to the officer in the navy who had the charge and issue of the provisions, slops, soap, tobacco, &c., and who also kept the ship's books; the title was one of the oldest in the service, but the holders of it for long only ranked as warrant-officers, and their duties and responsibilities were in many respects very ill-defined. In the old war-days they were looked upon with great dislike by the seamen, as they were credited with enriching themselves at the expense of the men. In 1844 this branch of the service was completely reorganised, Paymaster (q.v.) being substituted for the title purser. Purser is now the title of the officer in the Mercantile Marine on board mail steamers who deals with the cabin accommodation, food-supply of passengers and crew, and office work connected with mails, cargo, &c.; he is the representative of the company's office on board, and has general charge of stewards, &c.

Purslane (*Portulaca*), a genus of plants of the family Portulacaceae, having a bifid calyx, four or six petals, eight or sixteen stamens, and a capsule dividing around the middle. Common Purslane (*P. oleracea*) grows in cultivated and waste grounds on the seashore in almost all tropical and subtropical parts of the world. It is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and obovate fleshy leaves, which, as well as the young shoots, are frequently used in salads. The young and tender shoots are pickled in France like gherkins. Purslane is not so common in British gardens as it once was. Some species of Portulaca, such as *P. grandiflora*, of which there are several brilliant varieties, and *P. Gilliesii*, are choice half-hardy annuals occasionally cultivated in British gardens. They are reared in hotbeds in spring and planted out in the flower-garden in the end of May, or they are grown in pots exclusively for the purpose of decorating the greenhouse.

Pursuivant. See HERALD.

Pus is a well-known product of inflammation, and occurs as a thick yellow creamy fluid, differing

from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar odour, usually an alkaline reaction, and a specific gravity of about 1.032. Like the blood, it consists of certain definite microscopic elements, and of an intercellular fluid or serum in which they swim.

Of microscopic elements we have (1) the pus-corpuscles, which, both in their microscopical and chemical characters are identical with the white blood-cells from which they are derived; in diameter they range from .004 to .005 of a line, and each corpuscle appears granular, and has one or more nuclei, which can be rendered much more apparent by the addition of acetic acid or by various aniline stains. The other elements are (2) molecular granules and (3) fat-globules. The serum of pus is perfectly clear, of a slightly yellow colour, closely resembling blood-serum, and coagulates on heating into a thick white mass.

The chemical constituents of pus are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180), fats (from 9 to 25), extractive matter (from 19 to 29), and inorganic salts (from 6 to 13), in addition to which mucin, pepsin, glycine, urea, &c. are occasionally present. Of the inorganic or mineral constituents the soluble salts are to the insoluble in the ratio of 8 to 1, and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. The mode of formation of pus is described in the article SUPPURATION.

Pusey, EDWARD BOUYERIE, was born in the year 1809 at Pusey in Berkshire. He was descended from a family of Flemish refugees; his father was the youngest son of the first Viscount Folkestone, and had assumed the name of Pusey when the estates in Berkshire were bequeathed to him by the last representatives of the Pusey family. He was educated at Eton and Christ Church, Oxford, and was elected a Fellow of Oriel College in 1823. As soon as he had completed his studies at Oxford he passed to Germany, partly to study German, which was in the Oxford of those days practically an unknown tongue, partly to study oriental languages, and partly to become acquainted with the latest forms of German theological teaching. In 1827 he returned to England, and in the following year the Duke of Wellington appointed him regius professor of Hebrew at Oxford, a position which he retained until his death. Although his fame in other respects has caused his Hebrew lecturing to be forgotten, he laboured most unweariedly in the duties of his chair, and attracted a great number of pupils. His first work was an essay in which he sketched the causes that contributed to the Rationalistic character of recent German theology. He acknowledges his indebtedness to Professor Tholuck for some portions of this essay, but the elaborate proof of his position was his own work executed with characteristic thoroughness. It was severely commented on as leaning very decidedly in the direction of the Rationalistic teaching with which it dealt; the charge was greatly exaggerated, besides being caused in part by vagueness of expression throughout the volume. His main position was unassailable: German Rationalism he maintained was the consequence of the spiritual deadness of the orthodox Lutheranism of the day. He was misunderstood as if he had attacked the creed of the Lutherans in its orthodox portions: as a matter of fact he only wished to attribute Rationalism to the want of life in the Lutheran body. But many of his statements were in later years very unsatisfactory to himself, and he withdrew the work from circulation. The whole aim of his life was to prevent the spread in England of Rationalism such as that with which he had become familiar in Germany.

Hence, when in 1833 John Henry Newman with the same object began the issue of the *Tracts for the Times*, Pusey very soon joined him; and they, with Keble, were the leaders of this eventful effort. Their object was not to attack the statements of Rationalistic teachers; there was as yet no call for that in England; but they desired to stir up in the Church of England a spiritual vitality and power which would be of itself the best preservative against the infection of the Rationalistic spirit. For this purpose they attempted not to reform, but to restore; they appealed to the idea of the church, to its divine institution, to its services, to its sacraments, to its formulas of faith, to its history, and to the examples of the holiest lives in former generations. They endeavoured to make the church live again before the eyes and minds of men as it had lived in times past. In this connection Pusey wrote his contributions to the *Tracts for the Times*, especially those on Baptism and the Holy Eucharist. His sermons also were vigorous appeals to live the Christian life, and careful expositions of the doctrines which the church from the first had taught. With a similar purpose also in 1836 he commenced the translation of the writings of the ancient fathers of the Christian church under the title of the *Oxford Library of the Fathers*. Dr Pusey's chief contributions to it were a translation of St Augustine's Confessions and of several of the works of Tertullian. The result of these efforts—to which, with the exception of his professorial duties, Dr Pusey entirely devoted himself—was most conspicuous, and extended far beyond the ranks of those who were called by their opponents either Newmanites or Puseyites. But the work was checked by the action of the authorities at Oxford. First Newman's celebrated Tract 90 was condemned in 1841, and in 1843 Pusey was suspended for three years from his office of preaching in Oxford. The occasion of this suspension was a sermon on the Holy Eucharist which he preached before the University, and which a board of six doctors of divinity, without allowing Pusey a hearing, or specifying the points on which he was supposed to be in the wrong, pronounced to be contrary to the teaching of the Church of England. As soon as an opportunity offered Pusey reiterated his teaching, and this time he was unmolested. But before his suspension was over Newman had joined the Roman Catholic communion, and with him went several of his leading disciples. All murmurs pointed to the certainty of Pusey soon following; but those who knew him best were assured that never for one moment did he entertain any thought of leaving the Church of England. With Keble he at once set himself to reassure those who were reeling under the blow of Newman's departure; and it was mainly the moral weight of Pusey's work and character which prevented the powerful efforts of Newman between 1823 and 1841 from resulting in a catastrophe greater than any which the English Church has ever experienced. Pusey's unflinching loyalty to the church and deep conviction of God's presence with it, his buoyant hopefulness even in the darkest days, and his great patience cheered and settled many anxious hearts, and stopped others who were on the point of following Newman. His attitude would have had a yet wider result, except for the sad events which followed in rapid succession in the ten years subsequent to Newman's secession. The new power which a civil court had acquired over doctrinal suits—which was exhibited in the judgment in the Gorham case—the constant attacks of bishops and others upon the Oxford movement, the practical inhibition of Pusey from all ministerial work in the diocese of Oxford by Bishop Wilberforce, whereby it was made to appear that the church

disowned his teaching—these and other less important but significant events caused the departure to the Roman Church of another band of distinguished men, including Archdeacon (Cardinal) Manning and Archdeacon Wilberforce. But still Pusey laboured on, carefully defining the exact position of the English Church, as against Roman claims on the one hand and against Zwinglianism and Erastianism on the other.

Only the chief of his numerous writings during this period can be alluded to. They included a lengthy letter on the practice of confession, *The Church of England leaves her children free to whom to open their griefs* (1850), a treatise the form of which makes it appear to belong to a moment of controversy, although the matter is really of permanent value; a general defence of his own position in *A Letter to the Bishop of London* in 1851; a work on *The Royal Supremacy not an arbitrary authority, but limited by the laws of the Church of which Kings are members*, in 1850; a larger book on *The Doctrine of the Real Presence*, as contained in the Fathers (1855), and as taught in the Church of England (1857). In this class of writings may be included also Dr Pusey's *Exposition* (part i, in 1865, ii, in 1869, iii, in 1870). The object of these volumes was to clear the way for reunion between the Church of England and the Church of Rome on the basis of Catholic, as distinct from Roman Catholic, doctrine and practice.

The reform of Oxford University, which was undertaken after the report of the first Royal Commission on the Universities, and which destroyed for ever the integrity of the originally most intimate bond between the University and the Church, greatly occupied Pusey's mind. His evidence before the commission, his remarkable pamphlet on the comparative advantages of *Collegiate and Professorial Teaching and Discipline*, and his assiduous work on the Hebdomadal Council for many years are proofs of the interest that he took in the welfare of his university, and of the importance that he attached to a close connection between education and religion.

From 1860 onwards the tide had turned. The teaching for which the Tractarians had laboured and suffered was at that time beginning to be recognised, and those disciples of the Oxford movement who had survived the shock of the events of the last twenty years were spreading its principles throughout the country. But the fruits of the intolerance and persecution of which Oxford had been the scene were also ripening in the form of the spread of religious indifference, based on Rationalistic views of revelation. This was the enemy which from the first Pusey had dreaded. He had at least the satisfaction of knowing that, as a result of the movement in which he had taken so prominent a part, the inner life of the English Church was far better able to bear the onset of such a foe, and to estimate the moral and spiritual ravages which it would make, than was the Lutheran body of the 18th century, or even the Church of England in 1830. Against such teaching he contended for the rest of his life. All his later sermons before the university and most of his later books deal with it. It was with this purpose that he prosecuted Professor Jowett for his statements in his commentary on St Paul's Epistles, and that he took so prominent a part in the later controversy about the Athanasian Creed. His chief works in this connection are the *Lectures on the Book of Daniel*, and *What is of Faith as to Everlasting Punishment?* The former, delivered in 1863, vigorously attacked those writers who would assign to the Book of Daniel a date as late as the 2d century B.C. Apart from the marks which the lectures bear of the

heated controversy of the time when they were delivered, they are a monument of the author's intellectual power, wide reading, and solid learning. The other book is against the denial of everlasting punishment: its sobriety and fullness, the familiarity which it shows with all the issues raised in the controversy, its deep religious feeling, its calm and calming tone make it one of the most remarkable of Pusey's works. Of a kindred character, although in a different field, are the last two university sermons which he wrote—on the relation of science to faith and on the nature of prophecy.

Two other works must be noticed. Pusey inherited from his predecessor in the Hebrew chair the task of completing *A Catalogue of the Arabic Manuscripts in the Bodleian Library* (1835). It was a most toilsome duty, and occupied his time for six years. Pusey's *Commentary on the Minor Prophets* (1860-77) was his contribution to a commentary on the whole Bible which he had in his mind for many years, and on which he enlisted the labours of Keble and many others. Pusey alone completed his task; death, advancing years, or the claims of other duties prevented the others from contributing their share.

In private life Pusey was a man of warm affection, and widely known for his gentleness, sincerity, and humility. He rarely went into society in early life; at first he withdrew from it for purposes of study and to save more money to give to the poor, but from the time of his wife's death in 1839 he avoided all social amusements. But he was always accessible to any one who wished his advice on religious questions; in fact, he was constantly sought as a spiritual guide by persons of every station. His charity was bounded only by his income; besides abundant gifts to poor people, he spent large sums of money in helping to provide churches in East London, in building St Saviour's, Leeds, and in founding and supporting sisterhoods. His capacity for study and for literary work was immense. He worked only at what it was his duty to study, but within that line he spared neither time nor pains in thoroughly mastering every detail. His power of keeping his main object before his mind without being confused by its details, and of grouping the details in their due position, can be seen in almost any of his works. Opponents of all schools gave him the credit of being confused; but an occasional confusion in his manner of expressing his thoughts did not prevent him from knowing his own mind with singular clearness. He died on 16th September 1882.

The Life of Pusey by Liddon, left unfinished at his death, was completed by J. O. Johnston, and R. J. Wilson, the Canon's Literary executors (5 vols. 1893-99). See also G. V. E. Russell's book (1907).

Pushkin. ALEXANDER SERGEEVICH, was born at Moscow, 26th May 1799, and educated at Tsarskoe Selo. In 1817 he entered the service of the government, but on account of his liberal opinions was for some time transferred to Bessarabia. In 1820 he published a romantic poem, *Ruslan and Lyudmila*. Next came his *Prisoner of the Caucasus* (1822), his *Fountain of Bakhchisarai* (1826), *Tzigani* ('The Gypsies,' 1827), and *Eugene Onegin* (1828; Eng. trans. 1881), a clever novel in verse somewhat after the style of Byron's *Beppo*. In 1829 he published *Poltava*, which has *Mazepa* for its hero. About the same time he wrote his fine tragedy *Boris Godunov*. Besides these works of considerable length, he was the author of many graceful lyrical poems, deservedly popular throughout Russia. He also left some prose writings, consisting of a *History of the Revolt of Pugachev* (in the reign of Catharine), several tales, and miscellaneous essays. He was appointed Russian

historiographer with a pension of 6000 roubles. He was mortally wounded in a duel, and expired at St Petersburg, 29th January (10th February) 1837. Pushkin is considered the greatest poet whom Russia has yet produced. His writings show versatility, a powerful imagination with vigour of expression. In his *Eugene Onegin*, a Don-Juanesque poem, he is both humorous and pathetic, and many of his smaller pieces display wonderful elegance and finish. See a book by Prince D. S. Minsky (1926).

Pushtu, or PUKHTU. See PASITO.

Pustule, a circumscribed elevation of the cuticle, containing pus; in fact, a small abscess in the skin. Pustules occur in many skin diseases—eczema, acne, scabies, ecthyma, boils, &c.; also very prominently in smallpox. For Malignant Pustule, see ANTHRAX.

Puteaux, a town adjoining Paris to the west, on the left bank of the Seine, opposite to the Bois de Boulogne. Many Parisians have fine villas here. Pop. 33,500.

Pute'oli. See POZZUOLI.

Putnam, a town of Connecticut, on the Quinnebaug River, 56 miles by rail ENE. of Hartford, with textile and other industries. Pop. 8000.

Putnam, ISRAEL, a general of the American Revolution, was born in what is now Danvers, Massachusetts, 7th January 1718. In 1739 he bought a farm between Pomfret and Brooklyn, Connecticut, and for many years devoted himself to its cultivation, gaining meanwhile a high reputation for courage by such personal exploits as following a she-wolf into her lair and killing her single-handed. In 1755 he left as a captain in a contingent of 1000 men which Connecticut sent to repel a threatened French invasion of New York, and was present at the battle of Lake George. In 1758 he was captured by the savages, tortured, and then bound to a tree, and was about to be burned to death when a French officer scattered the fire-brands and rescued him. In 1759 he received a regiment, in 1762 he went on the dreadful West India campaign which resulted in the capture of Havana, and in 1764 he helped to relieve Detroit, then besieged by Pontiac (q.v.). Ten years of quiet at home succeeded, during which he made his farmhouse into an inn, and was conspicuous among the 'Sons of Liberty.' In 1775, after Concord, he was given the command of the forces of Connecticut, and was ranking officer on the day of Bunker Hill, though not in actual command at either the redoubt or the rail-fence. He was next appointed by congress one of the four major-generals, and held the command at New York and in August 1776 at Brooklyn Heights, where he was defeated by General Howe on the 27th. He afterwards held various commands, and in 1777 was appointed to the defence of the Highlands of the Hudson. While at Peekskill a lieutenant in a loyalist regiment was captured as a spy and condemned to death; and, on Sir Henry Clinton's sending a flag of truce threatening vengeance if the sentence should be carried out, Putnam wrote a brief and characteristic reply: 'Headquarters, 7th August 1777.—Edmund Palmer, an officer in the enemy's service, was taken as a spy lurking within our lines; he has been tried as a spy, condemned as a spy, and shall be executed as a spy, and the flag is ordered to depart immediately.—Israel Putnam.—P.S.—He has accordingly been executed.' In 1778, in western Connecticut, Putnam made his famous escape from Governor Tryon's dragoons by riding down the stone steps at Horseneck. The next year he had a stroke of paralysis, and the rest of his life was spent at

home. He died 19th May 1790. See *Life by Increase N. Tarbox* (1876), and article by Professor John Fiske in Appleton's *Cyclopædia of Amer. Biog.* (1888).

His cousin, RUFUS PUTNAM, born 9th April 1738, served against the French from 1757 to 1760, and then settled as a farmer and millwright. On the outbreak of the war he received a lieutenant-colonel's commission, and rendered good service as an engineer. In 1778 he helped his cousin to fortify West Point. Afterwards he commanded a regiment till the end of the war, and in 1783 he was promoted to brigadier-general. In 1788 he founded Marietta, Ohio; in 1789 he was appointed a judge of the supreme court of the North-west Territory; and from 1793 to 1803 he was surveyor-general of the United States. He died in Marietta, 1st May 1824.—Israel's grand-nephew, GEORGE PALMER PUTNAM, born in Brunswick, Maine, 7th February 1814, in 1840 became partner in the book-firm of Wiley and Putnam, New York, established a branch in London in 1841, and in 1848 returned to the United States and started business alone. In 1852 he founded *Putnam's Magazine*. In 1863 he retired from business, but in 1866 he established the firm of G. P. Putnam & Sons (now G. P. Putnam's Sons). He died 20th December 1872. He wrote and compiled several books, and was the author of the first *Plea for International Copyright* (1837) printed in America.

Putney, a suburb of London, since 1885 a district of the borough of Wandsworth, 6 miles WSW. of Waterloo, on the south side of the tidal Thames, which, 300 yards broad, is crossed by a granite bridge (1884-86), leading to Fulham. It is the starting-point of the Oxford and Cambridge boat-race. The parish church, with a 15th-century tower and the chantry of Bishop West of Ely, was mainly rebuilt in 1836. Putney is the birthplace of Thomas Cromwell and Gibbon, and the deathplace of Pitt and Leigh Hunt, and of Swinburne, who lived there with Watts-Dunton. From Putney's old bridge Mary Wollstonecraft tried to drown herself; and on Putney Heath Pitt fought his duel with Tierney (1798), Castlereagh his with Canning (1809).

Putrefaction is the decomposition, accompanied by an unpleasant odour, which all albuminous matter undergoes when kept for some time at the ordinary temperature. It is due, in all cases, to the action of bacteria (q.v.), with which the material has become infected. When the protein is finely divided and freely exposed to the air the decomposition is largely one of oxidation, and the characteristic smell is not observed. This is probably what occurs with the protein of the vegetable débris in the soil. In the absence or only limited presence of air, typical putrefaction ensues. The protein is in all cases first more or less completely broken down by hydrolysis into its constituents, the amino-acids (see FERMENTATION), this process taking place both within and outside the bacterial cells. In the absence of air these products are further attacked by anaerobic bacteria, and converted partly into bases and partly into acids and other non-nitrogenous substances. At the same time carbon dioxide hydrogen and frequently marsh gas are evolved together with sulphuretted hydrogen derived from the sulphur present in the protein. The characteristic putrid smell is due in part to volatile sulphur compounds, in part to indole and skatole, derived from tryptophan, one of the constituent amino-acids of most proteins, and in part to butyric acid and other similar substances. In a mass of putrefying material, such as the body of an animal, a large number of different species of bacteria are active, as well as many

higher organisms. On the surface aerobic bacteria carry out processes of oxidation, thereby removing the oxygen, so that in the lower layers a suitable atmosphere is provided for the anaerobic bacteria (such as *B. putrificus*), which are the chief agents of typical putrefaction. Ultimately the non-gaseous products reach the soil, and are there further oxidised, the carbon being converted into carbon dioxide and the nitrogen largely into ammonia and finally into nitrates; the sulphur and phosphorus are at the same time converted into sulphates and phosphates. Practically the whole of the material is thus rendered available for assimilation by plants. Putrefaction can be prevented by any means which prevents the infection of the material or the growth of the bacteria (see BACTERIA, DISINFECTANTS, GERM THEORY).

Putrid Fever. See JAIL FEVER.

Putty, a composition of whiting and drying oil worked into a thick paste, used by painters and glaziers, which in time becomes very hard.

Putty-powder, the dioxide of tin, prepared from the seam or crude oxide which forms on the surface of melted tin, is used for polishing stone and glass, for making white enamel, and for giving glass an opaque colour.

Putumayo, or ICA, a tributary of the Amazon, rises in Colombia, and flows S.E. for 950 miles. Rubber-collecting under Peruvian auspices was in 1910-12 proved to be carried on with atrocious cruelty to the Putumayo Indians.

Puvis de Chavannes, PIERRE (1824-98), was born and educated at Lyons, but after studying with Scheffer and Couture, spent most of his life in Paris. A decorative painter of the very first rank, he produced mural decorations for the Panthéon (illustrating the legend of Ste. Geneviève), the Hôtel de Ville, and the Sorbonne in Paris, and also for buildings in Rouen, Lyons, Amiens, Marseilles, and Boston (Mass.). Though Puvis de Chavannes must be called a symbolist, yet he always remained content to work from nature, sublimating ordinary and familiar characters, gestures, and expressions. His colouring, simple and harmonious, is admirably calculated to retain the greatest possible amount of light, while his drawing is always dignified and majestic. See works by A. Michel, Vachon (1900), and R. Jean (1914).

Puy, LE, or LE PUY-EN-VELAY, a town of France (dept. Haute-Loire), 70 miles SW. of Lyons by rail, consists of the new town in a valley and the old town, this latter one of the most picturesque in France. Puy (Berry, *pui* or *peu*, 'a hill'; Ital. *poggio*; Lat. *podium*; Gr. *podion*) is the name commonly given in the highlands of Auvergne and the Cevennes to the truncated conical peaks of extinct volcanoes. The town of Le Puy stands on the steep slopes of Mont Anis (2050 feet), from the summit of which starts up precipitously the basaltic mass called Mont Cornille, crowned by a colossal figure (53 feet) of the Virgin, made of Russian cannon brought from Sebastopol. The most notable building is the Romanesque cathedral (6th-12th century), with a venerated image of the Virgin and ancient cloisters; it is situated in the highest part of the town. There are other ancient and interesting churches and a museum. Lace and thread work are manufactured. Pop. 18,000.

Puya, a genus of Bromeliaceæ of which about fifty species are known, each inhabiting a comparatively small area, of pronounced ecological diversity, from Roraima to Colombia and Chile. One species will be found only on the edge of eternal snow, another will prefer a dry warm valley, a third a fog-swathed mountain moor. They have

long leaves, mostly provided with thorny teeth, sometimes forming a rosette on the ground, sometimes a tuft at the end of a thick tree-like stem, upright or trailing, simple or branched. One gigantic Peruvian species stands 30 feet high. The inflorescence, mounted on a peduncle a yard long, rising out of the crown of leaves on the top of the trunk, accounts for half of its height. In habit Puya shows a remarkable resemblance to the huge Lobelias of the mountains of Central Africa.

Puy-de-Dôme, a central department of France, containing an area of 3070 sq. m. and a pop. (1891) of 564,266; (1921) 490,560. The western part is an elevated volcanic region, studded with numerous extinct cones, and greatly broken by cornices, erosion valleys, crater lakes, &c. (see FRANCE). The highest cones are Puy de Sancy (6188 feet) and Puy-de-Dôme (4806); on the east side the Forêt Mountains (5380) march with the frontier. The principal rivers are the Allier, a tributary of the Loire, and the Dordogne. The soil is, in general, thin and poor; but its volcanic character fosters vegetation, especially in the valley of Limagne. Agriculture and cattle-breeding are the chief occupations. The climate is uncertain, and severe in the mountains. The principal minerals are coal and lead. Hot and cold mineral springs are abundant, among the most frequented being those of Mount Dore (q.v.), Châteauneuf, St Nectaire, Royat, Châtelon, &c. The department is subdivided into the arrondissements of Ambert, Clermont-Ferrand, Issoire, Riom, and Thiers. Capital, Clermont-Ferrand.

Puzzolana. See CEMENTS.

Pwllheli, a Welsh fishing port and popular watering-place, on Cardigan Bay, 22 m. by rail SW. of Carnarvon. It has a 14th-century charter, is a municipal borough, and mites with Carnarvon, &c. to return one member. Pop. 3800.

Pyæmia (from the Gr. *pyon*, 'pus,' and *haima*, 'blood'), or purulent infection of the blood, is a disease whose exciting cause is the introduction of decomposing pus or wound discharges, or the products of decomposition of animal fluids, into the circulation, through an ulcer or a wound, or an imperfectly closed vein (see PHLEBITIS and PTERYAL FEVER). The term *Septicæmia* is applied by some to the same disease, by others only to very grave cases of pyæmia. The bacteria (most frequently streptococci) are absorbed, multiply in the blood, and by it are disseminated into other parts of the body (see GERM). Within twenty-four hours, in very acute cases, there are severe shiverings, headache, and giddiness followed by heat, perspiration, and accelerated circulation. In twenty-four hours more the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases the symptoms closely resemble those of typhoid fever, and in this form the disease is a common cause of death after surgical operations; such cases are invariably characterised by the formation of secondary abscesses in the lungs, liver, kidneys, and other internal organs, in various glands, in the joints, and in the tissues immediately under the skin. The pus of such abscesses always contains bacteria. There is usually more or less delirium. The patient generally dies of exhaustion. Recovery is rare. It is chiefly, however, in the presence of *predisposing causes*, such as previous illness, prostration from organic disease or surgical complaints, or from difficult parturition, unhealtly occupations, &c., that the bacteria act so severely; these, with the occurrence of putrefaction in a wound, may convert a comparatively slight local mischief into infection of the whole mass of the blood.

Bearing in mind the manner in which pyæmia originates, it is clear that this disease is one to be prevented rather than cured. Until about 1865, when it was acknowledged that pyæmia was the cause of death in 10 per cent. of all cases of amputation, and of 43 per cent. of all fatal primary amputations, the careful preparation of a patient before operation was, with justice, most strenuously insisted on. But the really essential matter in the prevention of pyæmia is the prevention of putrefaction in the wound discharges. This was clearly proved by the results achieved by Lister and other surgeons, when operations came to be performed under antiseptic or aseptic conditions (see ANTISEPTIC SURGERY). For several years Lister's wards in Glasgow Royal Infirmary, formerly ravaged by pyæmia, remained free of the disease after the adoption of the antiseptic system; after two years' practice of this treatment purulent infection disappeared from the wards of the hospital at Lyons, where it formerly had a permanent home; and similar testimony might be quoted from every quarter and to any extent. The recognition of organisms as the cause of putrefaction in wounds, and the means adopted to prevent their development, have practically abolished the risk of pyæmia, except in very much devitalised people and in the case of severe war wounds and similar conditions. In such cases sepsis is often impossible. When pyæmia has developed, it may be combated by local irrigation with and intravenous injection of hypochlorous acid in what is known as the Carrel Dakin treatment and by various forms of serum.

Pyatigorsk. See PIATIGORSK.

Pycnogonida, or SEA-SPIDERS, a class of marine Arthropods of unknown affinities. Some climb about on seaweeds and hydroids near shore, others live in deep water. The body consists of an anterior cephalothorax, coalescent or segmented, and a rudimentary unsegmented abdomen. The first

Pycnogonum littorale.

appendages are chelate, the second palpiform, the third carry the eggs in the males; but some of these are subject to suppression. Then follow four (or rarely five) pairs of walking legs, usually slender and long. The creeping movements of Pycnogons are very deliberate, but some swim well. Lost limbs are readily regenerated. The food consists largely of pieces of hydroids, which are squeezed in a suctorial proboscis. The eggs are fertilised as they are laid, and then they are fixed in a ball on the ovigerous legs of the male. In most cases the larva has only the first three pairs of appendages. See D'Arcy W. Thompson, 'Pycnogonida,' in *Cambridge Natural History*, vol. iv. 1909.

Pye, HENRY JAMES, poet-laureate, was born in London, 10th July 1745, and educated at Magdalen College, Oxford, in 1772 being made a D.C.L. He held a commission in the Berkshire Militia, in 1784 was elected member for that county, in 1790 succeeded Warton as laureate, and in 1792 was appointed a London police magistrate. He died at Pinner, near Harrow, 13th August 1813. The works of 'poetical Pye' (in Scott's phrase), who, as the editor of Byron's *Vision of Judgment* remarked, was 'eminently respectable in everything but his poetry,' are nearly twenty in number, and include *Alfred* (1801), besides birthday and new-year odes.

Pygmalion, grandson of the king of Cyprus, in love with an ivory statue of a maiden he had made, prayed to Aphrodite to give it life; and, his prayer being granted, married the maiden. There is no classical authority for calling her Galatea. In his *Pygmalion and Galatea* W. S. Gilbert followed a German play.

Pygmies. See DWARF, NEGRITOS.

Pylades. See ORESTES.

Pym, JOHN, was born of a good old Somersetshire stock at Brymore, near Bridgwater, in 1584. He entered Broadgates Hall (now Pembroke College), Oxford, in 1599, as a gentleman commoner, left in 1602 without a degree, and entered the Middle Temple. He was returned to parliament for Calne and married in 1614, but in 1620 was left a widower with five young children, and next year was again returned to parliament by Calne. This seat he exchanged in 1625 for Tavistock. He at once attached himself to the Country party, and proceeded to war against monopolies, papistry, the Spanish match, and absolutism with a vigour that brought him three months' disfigurement. In 1626, the year after the accession of Charles I., he took a prominent part in the impeachment of the Duke of Buckingham. In the parliament of 1628 he stood second only to Sir John Eliot, whom he ably supported in the debate on the Petition of Right, but whom he opposed in the matter of tonnage and poundage, decrying the privileges of parliament inferior to the liberties of the kingdom. In the Short Parliament (1640), when, in Clarendon's words, 'men gazed on each other, looking who should begin, much the greater part having never sat before,' Pym on 17th April 'brake the ice by a two hours' discourse, in which he summed up shortly and sharply all that most reflected upon the prudence and justice of the government, that they might see how much work they had to do to satisfy their country.' And lastly, in the Long Parliament, having meanwhile joined hands with the Scots, and ridden with Hampden through England, urging the voters to their duty, Pym on 11th November named Strafford, twelve years earlier his friend and ally, as the 'principal author and promoter of all those counsels which had exposed the kingdom to so much ruin.' In the impeachment of Strafford which followed, resulting in his execution under a bill of attainder, Pym took the leading part; and Pym's is the chief credit of this masterstroke of policy, which deprived the king of the one man of resolute temper and powerful genius who supported his cause. In the proceedings against Laud Pym was also conspicuous, as in the carrying of the Grand Remonstrance and in every other crisis of moment up to the time when war became inevitable; he was the one of the 'Five Members' whom Charles singled out by name. On the breaking out of hostilities he remained at his post in London, and there, in the exercise of the functions of the executive, rendered services to the cause not less valuable and essential than those of a general in the field. While the strife was yet pending he died, through the breaking of an internal abscess, at Derby House on 8th December 1643, having only the month before been appointed to the important post of Lieutenant of the Ordnance. 'King Pym' was buried in Westminster Abbey with great pomp and magnificence, but at the Restoration his remains were cast out into a pit in St Margaret's churchyard.

'The most popular man,' says Clarendon, 'and the most able to do hurt that hath lived in any time.' And such Pym was, only emphasis ought to be laid upon the 'able.' He was no demagogue, no revolutionist, as neither was he a narrow precisian. His intellect, on the contrary, was 'in-

tensely conservative,' in Gardiner's phrase; he was a champion of what he believed to be the ancient constitution against those who he thought were striving to subvert it. He was, moreover, an English country gentleman, who liked the good things of this life, and was not so circumspect in his conduct but what scandal made free with his name, asserting, for instance, that 'Master Pym had succeeded the Earl of Strafford in the affections of my lady Carlisle.'

See John Forster's *Eminent British Statesmen* (vol. iii, 1837); Goldwin Smith's *Three English Statesmen* (1867); C. G. Wade's *John Pym* (1912); and other works cited at CHARLES L. ELIOT (SIR JOHN), and STRAFFORD.

Pyorrhœa (from the Gr. *pyon*, 'pus,' and *rheo*, 'I flow') is the name given to any copious discharge of pus. The term is generally restricted to indicate the disease *Pyorrhœa alveolaris*, in which suppuration takes place within the sockets of the teeth. Matter collects round the roots of the teeth in large quantities, and wells up when pressure is made upon the gums with the finger or in the act of chewing. As a consequence, much matter is swallowed with the food, so that in many cases ill-health results. The teeth themselves often remain apparently quite sound. The condition occurs especially in some parts of the tropics, and should not be confused with the septic condition of the margins of the gums, which frequently accompanies carious teeth or the atrophy of the gums accompanying advancing years, and which is a relatively common and much milder condition, known as gingivitis. The cause of pyorrhœa is not known, though it is sometimes attributed to the presence of an ameba found in the pus. Treatment consists in employing measures to improve the general health, careful attention to the teeth, massage of the gums to get rid of the discharge, and the regular use of antiseptic mouth washes, particularly peroxide of hydrogen.

Pyracantha. See CRATEGUS.

Pyramid, in Geometry, is a solid figure, of which the base is a plane rectilinear figure, and the sides are triangles, converging to a point at the top or 'apex.' Pyramids, like prisms, are named from the form of their bases: thus, a pyramid having a triangle for its base is a triangular pyramid, with a square base, a square pyramid, &c. Pyramids may be either 'right' or 'oblique' (see PRISM). A right pyramid, with an equilateral figure for its base, has all its sloping edges equal; but this is not the case if the pyramid be oblique. The most remarkable property of the pyramid is that its volume is exactly one-third of that of a prism having the same base and vertical height; and it follows from this that all pyramids having the same base and height are equal. The word (Gr. *pyramis*) may be of Egyptian origin.

Pyramid, a structure of the shape of the geometric figure so called, the most important being the Pyramids of Egypt, which were reckoned among the seven wonders of the world. They are about seventy-five in number of different sizes, situated chiefly between 29° and 30° N. lat., and are masses of stone (or rarely brick), with square bases and triangular sides. Although various opinions have prevailed as to their use, as that they were erected for astrological, astronomical, and meteorological purposes, for resisting the encroachment of the sand of the desert, for granaries, reservoirs, &c., there is no doubt that they were really nothing more than the tombs of monarchs of Egypt who flourished from the third to the twelfth dynasty. With the exception of some very late pyramids in Nubia, none were constructed after the twelfth dynasty; the later kings were buried at Thebes, and other places, in tombs of a totally

different construction. The Pyramids of Egypt may be described as huge cairns built over the sepulchral chambers of kings. The Egyptian monarch was ever careful to prepare his 'eternal abode.' For this purpose a shaft of the size of the intended sarcophagus was first hollowed in the rock at an incline suitable for lowering the coffin, and at a convenient depth a rectangular chamber was excavated in the solid rock. Over this chamber a cubical mass of masonry of square blocks was then placed, leaving the orifice of the shaft open. Lepsius's theory that the pyramid continued to increase by additions so long as the king lived has been completely discredited. The whole erection was planned from the beginning, and the plan was generally adhered to. When the desired height was reached, the pyramid was cased with massive stones forming a smooth surface from top to bottom. This outer masonry or casing has in most instances been stripped off. Provision was made for protecting the vertical joint by placing each stone half-way over another. The masonry is admirably finished; and the mechanical means by which such immense masses of stone were raised to their places must have been powerful and elaborate. The finer stones were quarried at Tura and other places on the opposite bank of the Nile; sometimes, however, granite taken from the quarries of Syene was employed for the casing. The entrances were carefully filled up, and the passage protected by stone portcullises and other contrivances, to prevent ingress by the profane to the sepulchral chamber, though the priests apparently had access, by secret stone doors turning on pivots, for the purpose of making offerings to the dead. The sides of the pyramids face the cardinal points, and the entrances face the north. The most remarkable and finest pyramids are those of Gizeh (Giza), situated on the edge of the Libyan Desert,

Section of Great Pyramid of Gizeh:
A, B, entrance passages; E, Queen's Chamber; D, King's Chamber; G, well; H, subterranean apartment.

near Memphis, on the west bank of the Nile. Of the three largest and most famous the First or Great Pyramid was the sepulchre of Khufu, the second king of the fourth dynasty (3969-3908 B.C. according to Petrie). Khufu is the Cheops of Herodotus, the Chemmis or Chennimis of Diodorus, and the Suphis of Manetho. Its height was originally 481 feet, and its base 774 feet square; in other words, much higher than St Paul's Cathedral, on an area about the size of Lincoln's Inn Fields. Its slope or angle was 51° 50'. It has, however, been much despoiled and stripped of its exterior blocks for the building of the mosques and walls of Cairo. The original sepulchral chamber, 40 feet by 27 feet, and 10 feet 6 inches high, was hewn

in the solid rock, and was reached by a passage, 320 feet long, which descended to it from the entrance at the foot of the pyramid. The excavations in this direction were subsequently abandoned, and a second chamber, with a triangular roof, was constructed in the masonry of the pyramid, 17 feet by 19 feet, and 20 feet high. This was reached by a passage rising at an inclination of 26° 18', terminating in a horizontal passage. It is now called the Queen's Chamber, and occupies a position nearly in the centre. A third chamber, now called the King's, was then constructed by prolonging the ascending passage of the Queen's Chamber for 150 feet further into the very centre of the pyramid, and after a short horizontal passage, making a room 17 by 34 feet, and 19 feet high. To diminish the pressure of the superincumbent masonry on the flat roof five small chambers (B in fig.) were made vertically in succession above the roof, the apex of the pointed uppermost chamber (in which the name of Khufu is scrawled) being rather more than 69 feet above the roof of the King's Chamber. The end of the horizontal passage was carefully finished, and cased with slabs of red syenitic granite exquisitely fitted together; and in the King's Chamber is the broken red granite sarcophagus of King Khufu, 7 feet 6½ inches long, 3 feet 3 inches broad, and 3 feet 5 inches high to contain

which the pyramid was built. Piazza Smyth fancied (for it is nothing more than fancy) that this coffer was not a sarcophagus but a standard measure of capacity, of which the British quarter is the fourth part! As the heat of this chamber was stifling, two small air-channels, or chimneys about eight inches square, were made, ascending to the north and south sides of the pyramid, which perfectly ventilate it. After the mummy was deposited in the King's Chamber, the entrance was closed with granite portcullises, and a well made at the junction of the upward-inclined and horizontal passages, by which the workmen descended into the downward-inclined passage. In its internal arrangements, it should be noted, the pyramid of Cheops is unique, and has no parallel. According to Herodotus, this pyramid took a long time in construction—100,000 men being employed on it for thirty years. The famous

stones were said to be inscribed with writing but no evidence of this has been found. The internal scrawls are more recent than the pyramid itself. The Great Pyramid was opened by the Abbaside Khalif El Mamun in the 9th century.

The Second Pyramid is situated on a higher elevation than the first, and was built by Khufu's successor, Khafra or Khefen (died 3845 B.C.). It is 450 feet high, on a base of 700 feet, and has two sepulchral chambers, which were opened by Belzoni in 1816. The masonry is inferior to the first, but it was anciently cased below with polished stones, some of which remain, while the top still retains its original casing.

The Third Pyramid, built by Menkanra, or Mycerinus (3633 B.C.), next king of the fourth dynasty, is much smaller than the other two, being only 215 feet high by 350 feet at the base. It has three chambers, the lowest of which, granite lined, held a sarcophagus of whinstone and a wooden coffin. The inscription on the coffin reads: 'Osiris, King of the North and South, Men-Kan-Ra, living

for ever! The heavens have produced thee, thou wast engendered by Nut (the sky), thou art the offspring of Geb (the earth). Thy mother Nut spreads herself over thee in her form as a divine mystery. She has granted thee to be a god. Thou shalt never more have enemies, O King of the North and South, Men-Kan-Ra, living for ever' (Budge, *The Nile*, 141-142). From this we may conclude that the Egyptian religion and the doctrine of immortality were fixed as early as 3700 B.C. Amongst the debris of the coffin and in the chambers were found the legs and part of the trunk of a body with linen wrapper, supposed by some to be that of the monarch, but by others to be that of an Arab. This body and fragments of the coffin were removed to the British Museum; but the stone sarcophagus was unfortunately lost off Carthage by the sinking (1838) of the vessel in which it was being transported to England. The masonry of this pyramid is most excellent, and it was anciently cased half-way up with granite, the remains of which are still visible. It was wantonly damaged by Saladin's nephew, El-Kamil, in the 12th century, in the absurd desire of destroying it. The Third Pyramid is regarded with superstitious dread by the natives, on account of a supposed lady's ghost, and there is a curious legend connecting it with the courtesan Ikhedjet.

THE GREAT PYRAMID

There are six other pyramids of inferior size of interest at Giza believed to be the tombs of the families of Khufu and Khefen; others at Abou Roash, six miles to the north-west of the same spot; and four (originally fourteen) at Abu Sir (Busiris), of the fifth and sixth dynasties. A group of eleven pyramids remains at Sakkarah, some of which were explored in 1880-81 by M. Maspero, such as those of Unas, Teti, and Pepi, all of the fifth and sixth dynasties, or about 3500 B.C. The so-called Step Pyramid at Sakkarah was built by Netzer-Khet of the third dynasty. Six pyramids still stand at Dahshūr; and that at Mejdūm, with a peculiar construction in three stages, is the tomb of Senefut (4000 B.C.), Khufu's predecessor, and, according to Petrie, is the first example of the true pyramid construction. There are also pyramids in the Fayyūm, and some small quasi-pyramids of brick at Thebes. In Nubia, the ancient Ethiopia, are several of these quasi-pyramids, the tombs of the monarchs of Meroë from 600 to 100 B.C. and of some of the Ethiopian conquerors of Egypt. They

are taller in proportion to their base than the Egyptian pyramids, and do not preserve the true pyramidal form, and generally have a sepulchral hall, or propylon, with sculptures, which faces the east.

In Assyria the Birs Nimrūd, or Tower of Belus, was a kind of step-shaped pyramid of seven different-colored bricks, dedicated to the planets by Nebuchadnezzar. The Mnjelliba, another mound, was of pyramidal shape. The pyramid also entered into the architecture of the tomb of Sardanapalus at Tarsus, and of the Mausoleum of Artemisia at Halicarnassus. A small pyramid, the sepulchre of C. Cestius, imitated from the Egyptian in the days of Augustus, still exists within the wall of Aurelian at Rome. Temples and other monuments of pyramidal shape are found in India, China, Cambodia, Java, the Polynesian Islands, and elsewhere. The Toltecs and Aztecs erected temples in Mexico, called *Teocalli* (q.v.), or abodes of gods, of pyramidal shape, with steps or terraces by which to ascend and reach an altar, generally placed on the summit, where human sacrifices and other rites were performed. These, however, are not true pyramids, the pure and simple form of which is restricted to Egypt and thence to the period from the fourth to the twelfth dynasty. The pyramidal form entered extensively into the architecture of the Egyptians, and appears on the tops of obelisks and tombs as a kind of roof. Small models of pyramids, with inscribed adoration to the sun, or having royal names, were also placed in the tombs.

See Lepsius, *Ueber den Bau der Pyramiden* (1843); Vyse, *Operations carried on at Gizeh in 1837* (1840); W. Flinders Petrie, *The Pyramids and Temples of Gizeh* (1883). Ingenious fancies about the supposed metrological and astrological purport of the pyramids are given in Piazzi Smyth's *Our Inheritance in the Great Pyramid* (1864), and R. A. Proctor's *The Great Pyramid* (1882). The astronomical data afforded by the orientation of temples and pyramids were in 1891 subjected to investigation by Sir J. Norman Lockyer.

Pyramids, a game played on a billiard-table. Fifteen red balls are placed on the table in the form of a pyramid, the apex of the pyramid being on the *winning spot*, with the base nearer to the top of the table. There is also a sixteenth white ball, which is used by both players when striking. The object of the players is to hole the pyramid balls. The first stroke is from hand; the succeeding strokes are played from where the white ball stops, unless the striker runs in, when his adversary plays from hand. Also, when only two balls remain on the table, the white and the red are played with alternately. When a player holes a pyramid ball he scores one, and plays again on any ball he likes. If a player runs in or gives a miss, one is deducted from his score, and a red ball is replaced on the table on the winning spot, or as near in a straight line beyond it as it will go without touching another ball; if the player has made no score, he owes one, and the first red ball he holes is placed on the table. When all the red balls are holed, the lower score is deducted from the higher, and the difference is the number of lives won. The game is generally played for so much a life, with a stake on the pool equal to the value of three lives. The lives are not paid for when taken (as at pool), but the difference in the scores is recorded on a slate marking-board at the conclusion of each game.

The principal varieties of pyramids are *shell out* and *snooker*. Shell out is pyramids played by more than two persons. The only differences are that, if a player runs in or misses, one is deducted from his score, but no ball is replaced on the table, and that the last ball scores two. At snooker, in addition to the pyramid balls, some of the pool balls

(beginning with the yellow) are placed on various spots on the table. A red pyramid ball must first be played on, and, if it is holed, the striker must then play on a pool ball. The pool balls score two, three, four, five, and six respectively, according to the order of their colours on the marking-board; running in or missing when playing on a pool ball scores correspondingly against, the amount being added to the opponent's score. When a pool ball is holed, it is replaced on its original spot, and the striker must next play on a pyramid ball. When all the pyramid balls have been holed, the pool balls are played on in the order of their colours, but are not then replaced when holed.

A great point is to avoid being *snookered*—i.e. to play on a pyramid ball so that if holed a pool ball is left open, and *vice versa*. If a player is snookered, his adversary adds to his score the value of the newest pool ball. Some rules compel the striker to name the ball played at, when, if he fails to hit it, he is snookered off that. The rules of snooker vary much in different rooms.

Pyramus and Thisbe. The tragical history of these two lovers is told by Ovid in the 4th book of his *Metamorphoses*. They were natives of Babylon, and tenderly attached to each other, but, as their parents would not hear of their marriage, they had to content themselves with clandestine interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting-spot, was startled to discover a lioness. She immediately ran off, but in her terror and haste dropped her garment, which the fierce animal, that had just torn an ox in pieces, covered with blood. Soon after Pyramus appeared, and, seeing his mistress's robe, came to the conclusion she had been murdered, whereupon he killed himself. Thisbe now returned, and, beholding her lover lying dead on the ground, put an end to her own life. The story was a favourite one during the middle ages. Bottom pronounces it 'a very good piece of work and a merry' in *A Midsummer Night's Dream*.

Pyrenees, the mountain-chain that divides France from Spain, stretches across from the Mediterranean to the south-east corner of the Bay of Biscay, a distance of 270 miles; the breadth of the system varies between 15 and 70 miles, and the area it covers measures 13,000 sq. m. The Pyrenees form a regular and continuous chain, divisible into three portions, the Western, the Central, and the Eastern Pyrenees. The first-named division extends eastwards from the Bay of Biscay to the Port de Canfranc (or Col de Somport), a road that crosses the chain at an elevation of 5380 feet, and leads from Oloron to Saragossa. This division is the lowest in the entire chain, its average height being 3300 to 4300 feet. Here two passes give access to Spain, that of St Jean Pied de Port (or Roncesvalles) and that between Bayonne and Elizondo; the railway from Bayonne to San Sebastián passes the end of the chain close to the sea. The Central Pyrenees, extending from the Port de Canfranc to the Col de la Perche—which connects the valley of the French Tet (dept. Pyrénées-Orientales) with the valley of the Spanish Segre (prov. Lérida)—contain the highest peaks and the most imposing mountain-masses of the entire system, as Pic de Néthou (in Maladetta), 11,168 feet; Mont Perdu, 10,998; Vignemale, 10,794; Marboré, 10,673; and Pic du Midi, 9466. The summits of the Eastern Pyrenees, which extend eastwards from the Col de la Perche (5300 feet), the second pass over the lofty chain, range between 6500 and 7500 feet (Puigmal, 9545; Canigou, 9138); and, although the altitude decreases as they approach the Mediterranean, they still reach 2100

feet in the Albères close to the sea. This portion is crossed at the Col de Perthus by the old Roman road from Perpignan to Figueras and pierced at the coast end by the tunnel for the railway between the same two towns. The frontier between France and Spain or Andorra coincides generally with the line of highest summits in the main chain; the principal exception is that at *Maladetta* the frontier strikes north so as to include within the boundaries of Spain the valley of Arán, which geographically belongs to France. On both north and south the mountains sink down to the plains in a series of terraces, with precipitous faces, the general slope on the Spanish side being somewhat steeper than that on the French side. The valleys cut into the mountain-mass on both sides almost directly at right angles, in the form of deep ravines, and with the regularity of the spines of a fish's backbone. Very many of them terminate in caldron-shaped basins, called *cirques*, or by the native mountaineers *oules* (= pots), the sides of which are precipitous and seamed with waterfalls; the most celebrated is the *Cirque* of Gavarnie, at the head of Gave de Pau, with a waterfall 1515 feet high. Of the numerous streams that have their origin in the mountains, those on the Spanish side are for the most part feeders of the Ebro, whilst the French streams—generally called *gaves*—feed the Adour, the Garonne, and certain little rivers that reach the Mediterranean. The lower Pyrenean valleys through which these streams flow are in many cases covered with grass or forest, or even vineyards and olive-groves. Snow lies on the highest pinacles, the snow-line being put at 9200 feet on the south side and at 8300 on the north. A narrow belt of glaciers runs from east to west just below the peaks of the Central Pyrenees, but almost wholly on the French side. Vegetation is most developed in the Western division, where the rainfall is heaviest; but, whilst it is there central European in its characteristics, the vegetation of the Eastern division is allied to that of the Mediterranean coasts. The Pyrenees were heaved up during Tertiary times. The nucleus is granite, which comes to the surface in most of the highest peaks. But above the granite lie strata of nearly all ages, especially Silurian deposits, Cretaceous limestones (hippurite), and limestones (nummulite) of the Eocene period. Economic minerals are not generally abundant, though Pyrenean marbles were famous, and iron is worked in the French departments of Basses-Pyrénées, Ariège, and Pyrénées-Orientales; coal exists on the Spanish side and lignite on the French. There are numerous mineral springs (several being hot), those of Eaux-Bonnes, Canterets, Eaux-Chaudes, Bagnères de Bigorre and de Luchon, and Barèges being the best known. Three railways are destined to cross the range by tunnels. One will connect Bordeaux with Saragossa, following the Somport route, a second passing under Mont Vallier will connect Toulouse with Valencia; and the third with a tunnel between Ax les-Termes and Ripoll will give a route from Toulouse to Barcelona. Except the passes already mentioned, the Pyrenees are crossed only by mountain-paths, that none but foot-passengers can use, and they only in the summer; the most remarkable is Roland's Gap (9318 feet), on the west side of Mont Perdu. A great number of caves exist amongst the limestone formations, and in them valuable remains of prehistoric man have been found.

See works by Perret (1884), Prarond (1877), Taine (13th ed. 1893), Camena d'Almeida (1893), Trutat (1894), Spont (1914); guide-books by Gsell-Fels, Joanne, and Murray; and Count Henry Russell, *Pau, Biarritz, and the Pyrenees* (new ed. 1891).

Pyrénées, BASSES, a department in the south-west corner of France between the Landes and Spain, and having the Bay of Biscay on the west. Area, 2977 sq. m.; pop. (1921) 402,981. It is divided into the arrondissements of Pau, Oloron, Orthez, Bayonne, and Marliou. Chief town, Pau. The department occupies the northern slopes of the Western Pyrenees (3000-9800 feet), offshoots from which divide the department into a number of valleys, traversed by mountain-streams (*gaves*). The chief are the Gave d'Oloron, and Gave de Pau, and other tributaries of the Adour. The Bidassoa, with the Isle of Pheasants, where the treaty of 1659 was signed, forms the dividing line between France and Spain for a short distance. The high valleys and slopes are generally fertile, and well adapted for the growth of the vine, chestnut, and other fruits. Agriculture is the principal industry; large herds of cattle and sheep are fed on the extensive pastures, and many swine in the wide forests. Of the numerous mineral springs the most important are those of Biarritz, Eaux-Bonnes, and Eaux-Chaudes. The western half of the department is the home of the Basques (q.v.).

Pyrénées, HAUTES, a department of France, lying east of Basses-Pyrénées, is a part of the old province of Gascony. As its name implies, it contains the loftiest summits of the Pyrenees (q.v.), and is divided into the three arrondissements of Tarbes, Argelès, and Bagnères de Bigorre; chief town, Tarbes. The principal rivers are the Adour and the Gave de Pau. The climate is generally mild in the plains and sheltered valleys. The well-cultivated and artificially watered lowlands yield good crops of cereals, vegetables, and fruits of every kind, including the grape. Horses, cattle, sheep, and swine are reared. Marble and slate are quarried. In this department are the springs of St Sauveur, Bagnères de Bigorre, Barèges, and Canterets. Area, 1760 sq. m.; pop. (1921) 185,760.

Pyrénées-Orientales, a southern department of France, is bounded on the E. by the Mediterranean and on the S. by the Pyrenees. Area, 1598 sq. m.; pop. (1921) 217,503. It is divided into the three arrondissements of Perpignan, Prades, and Céret. The chief town is Perpignan. Like the other Pyrenean departments, this one embraces a series of parallel valleys formed by spurs from the Pyrenees. The plain of Roussillon occupies all the east of the department. Agriculture is extensively prosecuted, but vines constitute the wealth of the district, and include the red wines of Roussillon, the white muscatel of Rivesaltes, and others. This department ranks among the first as a producer of iron ore; granite, slate, and limestone are quarried. There are mineral springs at Amélie les-Bains, Vernet, and elsewhere. The population is Catalan.

Pyrethrum, an old genus of Composite now included in *Chrysanthemum*. Feverfew (q.v.), a native of Britain, is a notable species. A handsome double-flowered variety is cultivated; and Golden Feather, much employed in bordering, &c. in the bedding-out system of flower-gardening, is a yellow-leaved variety. Several other species are to be met with in flower-gardens, the most ornamental *P. roseum* (*Chrysanthemum coccineum*), from which have sprung many beautiful varieties with double and single flowers of brilliant colours. See INSECT-POWDER.

Pyrhellometer, a radiative thermometer (for measuring the direct heating effect of the sun's rays), consisting of a body heated by the sun's rays and a thermometer. See THERMOMETER.

Pyriltes, a name employed by mineralogists to designate a large class of minerals, which are com-

pounds of metals with sulphur, or with arsenic, or with both. They are crystalline, hard, generally brittle, and frequently yellow. The name pyrites originally belonged to the disulphide of iron, known as iron-pyrites or simply pyrite, and was given to it in consequence of its striking fire with steel (Gr. *pyr*, 'fire'), so that it was used for kindling powder in the pans of muskets before gun-flints were introduced. Pyrite (iron-pyrites) is commonly of a bright brass-yellow colour; it is often found crystallised in cubes, in which form small crystals of it are abundantly disseminated in some roofing-slates, and very large ones occur in some of the mines of Cornwall; it is also found crystallised in pyritohedrons and octahedrons, alone or in combination with cube faces; and it often occurs massive, globular, stalactitic, capillary, or investing other minerals as an incrustation. Beautiful specimens of globular pyrite are found in the chalk of England. It is a very widely diffused and plentiful mineral, occurring in many different kinds of rock. It is too abundant in many coal-seams, the action of water and air changing it into sulphate of iron (vitriol), during which change so much heat is evolved that the coal is frequently kindled by it, mines become unworkable, and the progress of the fire can only be stopped, if at all, by building up portions of them to cut off the access of air, or by the admission of a plentiful supply of water. Sandstones containing pyrite ought not to be employed for building purposes, as it is prone to oxidation. Sometimes it is changed into sulphate of iron, but when other bases are present in the rock the sulphuric acid often unites with these in preference, leaving the iron of the original sulphide free. The iron then becomes oxidised, and appears as dark brown blotches. The presence of pyrite thus leads to corrosion and unsightly staining. The colour of pyrite has often caused it to be mistaken for gold, a mistake which its hardness and comparative lightness should prevent, or its ready solubility in nitric acid, and its burning before the blowpipe on charcoal with bluish flame and smell of sulphur. But it sometimes does contain a small proportion of gold, occasionally even in visible grains. This auriferous pyrite is found in Siberia and in South America. Pyrite is never used as an ore of iron, but it is much employed in the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum. A rather unstable variety of iron disulphide of a very pale colour is called *Marcasite*: it crystallises in orthorhombic forms. Another sulphide of iron known as *Pyrrhotite* ($\text{Fe}_{n-1}\text{S}_n$) is magnetic, and may contain up to 5 per cent. of nickel.

Copper Pyrites, also called *Yellow Copper* and *Chalcopirite*, is the most abundant of all the ores of copper, and yields a large proportion (perhaps a third) of the copper used in the world. It is brass-yellow, the colour varying with the amount of copper which it contains, a rich colour indicating much copper, and a pale colour the presence of a comparatively large amount of iron; for this ore is not a sulphide of copper alone, but of copper and iron. It occurs massive and disseminated in rocks of almost every class, and is often found crystallised in octahedrons and tetrahedrons, but generally in very small crystals. It may at once be distinguished from iron-pyrites by its comparative softness, yielding readily to the knife, and by the green colour of its solution in nitric acid. Before the blowpipe, with borax and soda, it yields a bead of copper.—*Cobaltite*, an arsenio-sulphide of copper, is a principal ore of cobalt. It is generally of a silver-white colour, and occurs massive, disseminated, or crystallised in cubes, octahedrons, pyrito-

hedrons, either alone or in combination.—*Nickelite*, used as an ore of nickel, is a compound of nickel and arsenic. It is generally found massive, and is of a copper-red colour; hence it is called by the German miners *Kupfer-nickel*, because they mistook it for an ore of copper.

Pyritz, a manufacturing town of Pomerania, 25 miles SE. of Stettin by rail; pop. 10,000.

Pyrmont, a small town of Germany, was in Waldeck (or 'Waldeck-Pyrmont') till 1922, when by plebiscite it joined Prussia.

Pyrogallie Acid. See GALLIC ACID, PHOTOGRAPHY.

Pyroigneous Acid, or WOOD VINEGAR, a crude commercial form of Acetic Acid (q.v.). It is made by the destructive distillation of wood, and, besides acetic acid, contains tar, creosote, wood-naphtha, and other products, which have to be removed if it is required in a very pure state. The best woods for the distiller are 'hard' woods, although all will yield it. Oak branches stripped of their bark are cut into short billets, which are placed in cast-iron retorts, and a sufficient heat applied to drive off the volatile constituents and carbonise the wood. This acid is of great use in the arts, especially in making the acetates used by dyers and calico-printers; and it is also, when very carefully purified and properly diluted with water, used extensively as a substitute for common vinegar in pickling, and even for table use. It is also used in the preservation of fish, giving them a 'smoked' flavour.

Pyromancy. See DIVINATION.

Pyrometry, the measurement of temperatures beyond the compass of the mercurial thermometer (q.v.). The leading methods are ocular, calorimetric, and pyrometric. The eye alone is often sufficiently accurate, and can distinguish dull red, 525° C. (say 975° F.); cherry red, 800° C. (say 1450° F.); orange, 1100° C. (2000° F.); white, 1300° C. (2350° F.); dazzling white, 1500° C. (2700° F.). Or we may use cobalt glass as a means of more sharply discriminating the changes of visible colour; or other absorbent media, appropriate to different temperatures, may be used so as just to make the light invisible or too weak to enable an interposed pattern to be discriminated. Or, a wire may be heated by an electric current adjusted until the wire just becomes invisible against the background of the glow; the corresponding temperature of the wire is ascertained, by reference to a table, from the measured strength of the current. Calorimetric: a lump of heated metal is thrown into a known quantity of water; the rise of temperature is measured; the temperature of the heated metal is next calculated from its weight, its specific heat, and the rise of temperature and the quantity of the water. This method admits errors from loss of time and radiation; hence only rough results are attained, comparable with one another, but not numerically reliable. Of pyrometric methods may be named expansion of air, hydrogen or nitrogen (only suited for laboratory purposes, for glass melts, metals become permeable, and porcelain is fragile), or of mercury vapour: dilatation of solids—porcelain, platinum, or iron (Professor J. F. Daniell, 1821)—whose expansions are very small and difficult to measure, as they generally take up a new set or form when alternately heated and cooled; the shrinkage of clay (Wedgwood's pyrometer) giving variable results; the actual fusion of definite metals, alloys, or enamels whose melting-points have been previously ascertained; the temperature acquired by water made to flow uniformly through a tube partially exposed to the heat to be explored; the speeds of outflow

of air through an aperture at the atmospheric and at the furnace temperature (Barns, *American Journal of Science*, 1889); Siemens's electric pyrometer, which measures the change in the resistance of platinum wire exposed to the furnace heat; Becquerel's thermo-electric pyrometer, in which a thermo-electric couple (platinum-palladium) is exposed to the heat. When Le Châtelier's thermo-electric couple, consisting of platinum and platinum-plusten-per-cent.-of-rhodium, is used, the readings of a thermo-electric pyrometer may be consistent with one another.

See Poggendorff's *Annalen*, vol. xxix.; and for Ericsson's Solar Pyrometer, see *Nature*, vol. xxx.

Pyrope, a variety of garnet having the composition $3MgO \cdot Al_2O_3 \cdot 3SiO_2$. Chromium, calcium, and iron occur in some specimens. The colour of the mineral ranges from deep red to nearly black; it is often quite transparent, and is then of value as a gem stone. Pyrope is found in serpentines and peridotites. Well-known occurrences are those of Bohemia and Saxony. Specimens from South Africa are known as 'Cape rubies,' those found at Elie in Fife as 'Elie rubies.'

Pyrophone, also called *Flame-organ*, is a musical instrument invented about 1873 by Eugene Kastner (1852-82) of Paris, in which the musical tones are produced by flames of hydrogen gas burning in tubes of different sizes and lengths, arranged somewhat as in an ordinary organ.

Pyrophorus (from the Gr. *pyr*, 'fire,' and *phero*, 'I bear') is a term applied to any substances which take fire from the rapidity with which they are oxidised. If iron, cobalt, or nickel be reduced by hydrogen from its oxide at a low red heat, it is obtained in a state of such extreme division as to become incandescent by the oxidising action of the atmosphere; and the tendency to rapid oxidation is much increased by the interposition of some infusible matter, as a little alumina or magnesia, between the particles of the oxide. This is probably due to the cohesion of the minute particles of the reduced metal being thus mechanically prevented, and the access of air to the surface of each particle being thus facilitated. If tartare of lead be heated in a tube till the organic portion becomes charred, the metallic lead is reduced to a state of extreme subdivision, and usually takes fire when poured into the air. If finely-powdered sulphate of potash be mixed with half its weight of lamp-black, and heated in a covered crucible, the sulphate is reduced to sulphide of potassium, which remains in a finely-divided state, mixed with the excess of carbon, and takes fire spontaneously in the air from the rapid absorption of oxygen. These are amongst the best examples of pyrophori.

Pyrosis. See INDIGESTION.

Pyrosoma, a genus of compound or colonial Turbellarians, sometimes called 'fire-flames' on account of their brilliant phosphorescence. The colonies are hollow cylinders, open at one end, and the walls are formed of hundreds of individuals. These have inhaled apertures on the exterior, while their exhaled apertures open into the cavity of the cylinder, thus producing a gentle current, by means of which the colony is slowly propelled through the water with the closed end foremost. Several species occur in the warmer seas, and *P. giganteum* is from 2 to 3 feet long. See ASCIDIANS, PHOSPHORESCENCE.

Pyrotechny, the art of making fireworks, is of unknown antiquity. It was practised amongst the Chinese from very early times, and has attained with them so much perfection that the beauty and ingenuity of their devices have often been admired by Europeans. Fireworks, as the name is now understood, were hardly known in Europe until

the nature of gunpowder became known, and for a long time only very simple pyrotechnic contrivances were used.

The compositions employed for most kinds of fireworks are of the nature of gunpowder. That is to say, the mixtures of which they are made contain combustible or oxidisable substances, along with bodies available for their rapid combustion, since these latter contain large quantities of oxygen. The most frequently employed combustible materials are carbon (charcoal) or some compound of carbon, such as sugar or gum, and sulphur or a compound of this element, such as sulphide of antimony. Such bodies as charcoal and sulphur burn slowly in common air, because its oxygen is largely mixed with nitrogen, which does not support combustion; but when they are compounded with nitrates and chlorates the store of oxygen in these salts being given off by heat enables the firework composition to burn at a more or less rapid rate whenever a spark is applied to it. It is not desirable, however, to have too sudden a union of combustible matter with oxygen, hence violent explosives, like nitro-glycerine, are unsuitable for showing coloured or brilliant flames. The two most important oxidising ingredients used in firework compositions are nitrate and chlorate of potash. Iron, in the form of cast-iron or steel, and in a state of fine division, is a frequent ingredient in fireworks, and to some extent the powder or filings of antimony, zinc, magnesium, and copper are also employed. When the particles of these metals are highly heated they produce sparks and scintillations of different colours. A few substances, such as sand and sulphate of potash, are used to modify the rate of combustion.

Variety of colour is much studied in the production of fireworks, as it contributes greatly to their beauty. The colours usually seen are those given by simple metals when burned. Compounds of the metals form part of the mixtures, and these are reduced to the metallic condition in a state of very fine division by contact with the carbon present in the hot mass. A yellow colour is one of the most easily managed, any of the common compounds of sodium producing it. Copper gives a green colour when burned in a hydrogen flame, which changes to blue in the presence of a little free chlorine; so that when this metal is used for green some substance containing hydrogen is added, and when employed for blue, calomel (one of the chlorides of mercury) is put into the mixture. Nitrate of barium is also employed for green. Salts of strontium give fine crimson tints, calcium compounds a red, and lithium carbonate (a costly substance) a purple red. Among the substances used to produce white colours are sulphide of antimony and sulphide of arsenic.

The cases which contain the firework compositions are carefully made of paper or pasteboard, or both, pasted in layers. They are usually cylindrical in shape, and the proportion of length to diameter, and the size of openings for the escape of the burning mixtures, are matters of importance. So also is the proper mechanical construction of the framework of rotatory fireworks. Touch paper, prepared with a solution of nitrate of potash in alcohol, is used for capping squibs, crackers, and indeed for all kinds of fireworks; quick-match of cotton-wick, which has been saturated with gunpowder, gum, and other ingredients, connects the parts of complicated designs; and portfires, small pencil-like articles filled with saltpetre, sulphur, and gunpowder, are used to fire the touch-paper cappings.

The simpler kinds of fireworks include squibs, crackers, gerbs, Roman candles, stars, sparks, maroons, theatre-fires, Bengal lights, &c. *Squibs*

are small stout paper tubes filled with grained powder, to which a little charcoal, sulphur, and steel filings are sometimes added, a sufficient quantity of bursting powder being put in to cause a slight explosion at the end when fired. *Crackers* consist of a tube bent into folds, and containing meal-powder, charcoal, sulphur, saltpetre, and sometimes iron filings in varying proportions. The folds are tied by a cord; and on a cracker being fired a report is given at every turn of the tube. Serpents are tubes, some of which have a choke in the middle. When fired they take a zigzag direction, and give out a hissing noise. *Gerbs* consist of a straight cylindrical case filled with a composition which produces a bright sparkling jet of fire somewhat in the form of a waterspout. They sometimes contain coloured stars. *Roman candles* have a resemblance to gerbs. In filling them stars are placed at intervals along the tube between layers of the composition. *Stars* are of different kinds, such as simple stars, tailed stars, and pointed stars. Simple stars consist of saltpetre, sulphur, and fine gunpowder made into a paste ball with gum and spirits of wine, and dried. Sometimes they contain iron filings. Many compositions are, however, used for stars, their various colours alone necessitating this. Sparks, or small stars, are also made of different colours. *Maroons* are small boxes, round or square, bound with a cord, and containing a composition which explodes with a loud report. *Benign lights* consist of compositions varying according to colour, which are burned in small saucers: for example, a red light can be produced by a mixture of chlorate of potash, nitrate of strontia, sulphur, and lampblack; and a green by chlorate of potash, nitrate of baryta, chloride of lead, sulphur, and resin. *Theatre-fires* are produced by slow-burning compositions containing some colouring ingredient. They are burned without cases on a fireproof slab; and all substances obnoxious when burned indoors, such as sulphur, antimony, and arsenic, or their compounds, should be omitted in preparing them. Magnesium powder and the minute spores of one or more species of *leycopodium* are used to imitate lightning in theatres.

The most complicated kind of fireworks are some of the rotating wheels. These are called wheels because they have a framework of nave and spokes, round the rim of which cases of the nature of rockets are arranged. They revolve on a pin or metal spindle, and the motion is produced, as will be presently explained, by the recoil as the fire escapes from the cases, which are connected with each other by leaders. There are a number of different forms, but they may be classed under three kinds—vertical, horizontal, and spiral wheels. In the case of the last, a rod (nave) rises vertically from the centre of the horizontal wheel, forming the base, and upon this rod cases are arranged so as to form a spiral. *Pin or Catherine wheels* and *pastilles* consist each of a long paper case coiled round a rod in the form of a flat spiral, the case being, of course, filled with a burning composition. *Suns* are either fixed or revolving. Fixed suns are of various designs, but a common kind has a number of cases radiating from a centre, from which jets of fire proceed outwards. By a suitable arrangement the fire is communicated at the same time to the mouths of each of the cases. *Revolving suns* are somewhat similar to fire-wheels with spokes. Of ascending fireworks the *rocket* is the most familiar, and it has been known from an early period. It consists of two parts—viz. a long stick to guide it in its course, and a head. The latter, of strong paper and cylindrical in shape, has its lower portion formed into a hollow cone, base downwards, and round this cone is the burn-

ing composition. The object of the cavity is to effect a rapid combustion, which fills it with heated gases, and these, issuing downwards through a small hole in the base, force the rocket up through the air. The upper portion of the head is separated from the lower by a perforated plug of plaster of Paris, through which a fuse passes, so that when the lower portion is burned, the upper, which has a conical head, takes fire and sets off its garniture of stars, snakes, and other ornaments. When fire-arms are discharged there is a recoil, in the case of a heavy gun, of a short distance; in the case of a light cannon, with a larger charge in proportion to its weight, of a much greater distance; and in the case of a rocket which has a bulky charge in a very light barrel the recoil is great enough to send it high in the air. The motion of a fire-wheel is explained in the same way, there being a recoil caused by the backward pressure of the heated gases on the atmosphere as each case on the ring of the wheel takes fire. The *tourbillon* ascends and rotates at the same time. Upward motion is given by the fire escaping from holes on the under side of the cylinder, and rotatory motion by its finding vent from holes at the ends, but on opposite sides.

Aquatic fireworks, in which the devices which come in contact with the water require to be protected with grease or oil, consist of skimmers or water devils, floating Chinese trees, gels, and Roman candles, water mines, water fire fountains, &c.

Pyroxenes, a group of minerals comprising monoclinic, orthorhombic, and triclinic forms. The monoclinic pyroxenes occurring commonly in igneous and metamorphic rocks include both aluminous and non-aluminous silicates of calcium, magnesium, and iron, the former including Augite (q.v.), the latter Diopside. Varieties rich in sodium, such as Aegirine, are less common. The orthorhombic pyroxenes are all silicates of magnesium and iron. They form an isomorphous series, the names Enstatite (q.v.), Bronzite, and Hypersthene (q.v.) being given to varieties having respectively less than 5, between 5 and 15, and more than 15 per cent. of ferrous oxide. Triclinic pyroxenes, such as Rhodonite, a silicate of manganese, are rare.

Pyroxylic Spirit, also called WOOD SPIRIT and WOOD-NAPHTHA, is a mixture of acetone, methyl-alcohol, acetate of methyl, &c., obtained by the destructive distillation of wood in the manufacture of Pyroigneous Acid (q.v.). It is also obtained as a by-product in the manufacture of wood-pulp. Many of its properties are the same as those of common alcohol. It is of nearly equal value to alcohol in making varnishes, as it dissolves the resins, oils, and other similar substances. It has a peculiar naphtha-like odour, which is inseparable from it, and prevents its use as a potable spirit at present; but it is asserted that some makers produce it almost odourless, and that it sometimes takes the place of common alcohol in the manufacture of cheap perfumes. It is used in making Methylated Spirit (see METHYL) and in preparation of formaline.

Pyroxylin, a name for Gun-cotton (q.v.).

Pyrrhic Dance, the most famous war-dance of the ancient Greeks, especially the Spartans. The name was said to be derived from Pyrrhos, the inventor of the dance. The *Pyrrhic measure* in prosody consisted of two short syllables.

Pyrrho (Gr. *Pyrrhōn*), the founder of a school of Greek scepticism, named after him, was a native of Elis, born in the third quarter of the 4th century B.C. A pupil of Anaxarchus, he followed him when he went in the train of Alexander to Asia

and India. He lived to be ninety years old. Our knowledge of his teaching is derived principally from his pupil, Timon 'the Sillograph' (i.e. writer of *silloi*, 'satiric poems'); he himself left no writings. Pyrrho taught that we can know nothing of the nature of things, but that the best mental attitude is suspense of judgment, which brings with it calmness of mind. Pyrrhonism is often regarded as the *ne plus ultra* of (philosophical) scepticism: consistent Pyrrhonists were said even to doubt that they doubted.

Pyrrhus, king of Epirus, born about 318 B.C., a Greek warrior, was the son of *Æacides* and a distant kinsman of Alexander the Great. After experiencing many vicissitudes of fortune in his youth, he became sole king of Epirus in 295 B.C., and in the following year increased his territories by the addition of the western parts of Macedonia. In 281 B.C. a glorious prospect opened up before the eyes of the restless warrior—the conquest of Rome and the western world, which would confer on him a renown equal to that of his Macedonian kinsman. The Tarentines, a Greek colony in Lower Italy, then at war with the Romans, sent an embassy to Pyrrhus, in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. The king was overjoyed at the proposal, instantly accepted it, and in the beginning of 280 B.C. sailed for Tarentum with 20,000 foot, 3000 horse, 2000 archers, 500 slingers, and a number of elephants. The pleasure-loving Tarentines were far from pleased at the strict measures taken by Pyrrhus to inure them to the hardships of war. The first battle between Pyrrhus and the Romans, who were commanded by the consul, M. Valerius Laevinus, took place at the river Siris in Lucania. The contest was long, obstinate, and bloody; and Pyrrhus only succeeded by bringing forward his elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans. It was a hard-bought victory for Pyrrhus, who said, as he looked upon the field, thick-strewn with his numerous dead, 'Another such victory, and I must return to Epirus alone.' Hence the phrase 'Pyrrhic victory.' Many of the Italian nations now joined Pyrrhus, and he proceeded on his march towards Central Italy. The Roman senate would have accepted the terms proposed by Cineas, the eloquent ambassador of Pyrrhus, but for the stirring speech of old Ap. Claudius Cæcus, which made them resolve to 'fight it out' with the foreigner. Pyrrhus, after penetrating to within 20 miles of Rome, found it impossible to proceed farther with safety, as one Roman army occupied the city and another hung upon his flanks and rear. He therefore withdrew to Campania, and thence to Tarentum, where he wintered. The campaign of 279 was carried on in Apulia, and the principal engagement took place near Asculum. The Romans were again defeated; but Pyrrhus himself lost so heavily that he felt it impossible to follow up his victory, and again withdrew to Tarentum. Here a truce was entered into between the belligerents, and Pyrrhus passed over into Sicily to assist the Sicilian Greeks against the Carthaginians, 278. His first exploits in that island were both brilliant and successful; but the repulse which he sustained in his attack on Lilybæum broke the spell which invested his name. Soon afterwards he became involved in misunderstandings with the Greeks, and in 276 he quitted the island in disgust to renew his war with Rome. As he crossed over to the mainland the Carthaginians attacked him and destroyed seventy of his ships. In 274 he fought a great battle with the Romans, under the consul Curius Dentatus, near Beneventum, and was utterly defeated, escaping to Tarentum with only a few personal attend-

ants. He now saw himself forced to abandon Italy and return to Epirus, when he almost immediately engaged in war with Antigonus Gonatas, son of Demetrius, and king of Macedonia. His success was complete, for the Macedonian troops deserted to him *en masse*, and he once more obtained possession of the country; but nothing could satisfy his love of fighting, and in less than a year he was induced to enter on a war with the Spartans. He marched a large force into the Peloponnese and tried to take their city, but was repulsed in all his attempts. He then proceeded against Argos, where he met his death by means of a tile hurled at him by a woman from the roof of a house, 272 B.C.

Pyrus, a genus of trees and shrubs of the Rosaceæ, with five-celled fruit, with cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the characters of the flower and fruit, and formerly constituting the genera *Sorbus*, *Aria*, *Amoma*, &c., or included in *Mespilus* (see *MEDLAR*) and *Crataegus*. *Pyrus japonica* is by some referred to *Cydonia*; see *QUINCE*. Amongst the species of *Pyrus* are some of the most valuable fruits of temperate climates and some highly ornamental trees and shrubs. See *APPLE*, *PEAR*, *SERVICE*, *ROWAN*, *BEAM-TREE*.

Pytchley, a village of Northamptonshire, 3 miles SW. of Kettering, whence the famous Pytchley Hunt takes name. Amongst more than twenty masters of the hunt the most noted have been Lord Althorp (afterwards Earl Spencer; master from 1808 to 1817), 'Squire' Osbaldeston (1827-34), and Mr Payne (1844-48). See *FOXHUNTING*; and H. O. Nethercote, *The Pytchley Hunt, Past and Present* (1888).

Pythagoras is for us at once the glorified and the actual founder of the Pythagoreans—a philosophical school or sect which exercised a profound and lasting influence on the course of ancient science, philosophy, and theology from pre-Socratic times in Lower Italy, and then, down to the days of the Roman empire, in Greece, in Alexandria, and elsewhere. It cannot be too carefully borne in mind that the earliest written information we have about Pythagoreanism is the fragments not of Pythagoras himself but only of Philolaus, a successor, that the school was at first mainly characterised by its ethico-religious and political tendencies, and that the founder became among later adherents the object of mystical reverence and contemplation; accordingly our knowledge about the doctrines of the Pythagoreans and about the personality of Pythagoras is extremely limited. Aristotle, for example, only speaks of the Pythagoreans in his *résumé* of Greek philosophy, and he with Plato probably only knew of Pythagoras through the oral utterances of Philolaus. Pythagoras was born in Samos about 582 B.C. As regards his education we know only that he was made acquainted with the teachings of the early Ionic philosophers, and, through his travels (which are said to have been not only among the Egyptians, but among the Phœnicians, the Chaldeans, the Persian Magi, the Indians, Jews, Druids, Thracians, &c.), with those of the Egyptian priests. About 530 he settled in Crotona, in Magna Græcia, where he founded the moral and religious school called by his name. Pythagoreanism was first a life and not a philosophy, a life of moral abstinence and purification, reactionary against the popular and the poetic religions, but yet sympathetic towards the old (Doric) aristocratic forms and institutions. All that can be certainly attributed to Pythagoras is the doctrine of transmigration of souls, the institution of certain religious and ethical regulations, and

the beginning perhaps of those investigations into numbers and the relations of numbers which made the school famous. The Pythagoreans as an aristocratic party became unpopular after the defeat of the Sybarites by the Crotonians in 510 (see CROTONA, SYBARIS), and at first were instrumental in putting down the democratic party in Lower Italy; but the tables were afterwards turned upon them, and they had to flee from persecution. How Pythagoras himself died is not exactly known; his death (according to tradition, at Metapontum) may be placed about 500 B.C.

The Pythagoreans adhered at first to certain mysteries—indeed, the Orphic mysteries; an examination as to fitness qualified for admission into their number; obedience and silence, abstinence and simplicity in dress and food and 'external goods,' and the habit of frequent self-examination were prescribed. The enjoined disposal of worldly goods may have helped to foster contemplation and scientific enthusiasm. This at least developed itself in the school. Pythagoras, for example, is said to have practised investigations into harmonies and the properties of numbers. Mathematical investigations were first begun by individuals, and then carried on prominently by the school. Their attention was early turned to the odd and even, to prime numbers, square numbers, &c.; and from this arithmetical standpoint they cultivated geometrical studies, number becoming for them the chief principle in space. The elementary relations of harmonies and the regular rotations of the spheres led the Pythagoreans to think of the cosmic order as a numerical one, and, like the early Greek Realists in philosophy, they took number to have a metaphysical significance—to be, as Aristotle tells us, not only the form, but the very substance of things: 'All is Number' came to be their thesis. As numerical proportions are repeated in different things, they regarded numbers also as archetypes, of which things were in a sense the ectypes. They explained the harmonious arrangement of things as that of bodies in a single all-inclusive sphere of reality, moving according to a numerical scheme, the earth itself and the fixed stars all being in progress round the central fire. (It is interesting to notice this idea so early in science of the movement of the earth.) The scheme of revolution was given them first by the decad, each number of which had a peculiar significance, especially the unit, the dyad, the square, &c. The table of contraries they also used in explaining the kosmos: this included such contrasts as the limited and the unlimited, the even and the odd, one and many, right and left, male and female, light and darkness, and so on. In all this room was naturally given to fanciful and arbitrary speculation, developed later among the Neo-Pythagoreans in such tables as 1, the point; 2, the line; 3, the surface; 4, body; 5, quality; 6, soul, and so on. To the virtues numbers were also given, justice being the square number; the soul, too, was in general a harmony chained to the body. As the Pythagoreans thought the heavenly bodies to be separated from each other by intervals corresponding to the harmonic lengths of strings, they held that the movement of the spheres gave rise to a pleasing sound called the 'harmony of the spheres.' Of the so-called 'elements' they had also numerical theories, fire being the tetrad, earth the cube, air the octahedron, water the equation.

The great mathematical discovery of Pythagoras is of course the hypotenuse theorem, where the square is equal to the sum of two squares. 'Pythagorean numbers' are such numbers as are related in the way the theorem indicates—e.g. 5, 4, and 3 ($5^2 = 25 = (4^2 + 3^2) = 16 + 9$).

Various other theorems are closely connected with this cardinal one; these concern chiefly the squares of the various perpendiculars which may be let fall from the different angles of the right-angled triangle upon the hypotenuse and sides. The speculations in general of the Pythagoreans may be regarded from various sides. Their formal principle of number is often said, and with truth, to mark a transition from the crude Hylozoism of Thales and the Ionic philosophers to a formal or rational or conceptual contemplation of the world, developed, say, by the Eleatics, and culminating in Plato. Their idea of a quantitative combination of elementary units became a commonplace of Greek speculative cosmology, constituting the ground for a deductive ontology. The conception-general of a measure or proportion in things is, of course, a most pronounced trait in the Greek mind. It is easy to trace in the Pythagorean doctrine of the elements and the contraries and of combination and of spheric completeness all the essential features of Greek cosmology. The influence of Pythagoras and geometrical conceptions over the mind of Plato can hardly be exaggerated. The chief interest of the Pythagoreans doubtless lay in the domain of physics, and their astronomical theories may be said to constitute their capital achievement. If we remember, too, that Pythagoras is perhaps the first Greek thinker who conceived of philosophy as first a life, a life in common, we shall see in this the beginning of the legislative and ethical view of the philosopher's function expressed in the fullest way in Plato's *Republic*. The ascetic and mystical aspects of Pythagoreanism linked it closely with Platonism in the mind of Christian idealists in later times. See NEOPLATONISM, NEO-PYTHAGOREANISM.

BIBLIOGRAPHY.—The fragments of Philolaus were published by Boeckh in 1819. The brief notices Aristotle gives of the Pythagoreans in the first book of the *Metaphysics* contain almost all that is of philosophical importance in their theory. Zeller notices most that had been written on the subject (*The Pre-Socratic Schools*, Eng. trans. 1882). See also Delatte, *Études sur la littérature Pythagoréenne* (1915), Rostagni, *Il verbo di Pitagora* (1924), Cornford in the *Camb. Anc. Hist.*, vol. iv. (1926).

Pytheas of Massilia. See GEOGRAPHY.

Pythia. See DELPHI.

Pythian Games, one of the four great national festivals of the Greeks, held in the Crisean plain, near Delphi (anciently called *Pytho*), are said to have been instituted by Apollo after vanquishing the snake monster, Python, and were celebrated in his honour every four years. Originally the contests were restricted to singing, with the accompaniment of kithara-playing; but flute-playing, athletic contests, horse-racing, contests in poetry, and art were afterwards introduced, and long continued a distinguishing feature of these games, which are believed to have lasted down to nearly the end of the 4th century A.D. The prize was a laurel wreath and the symbolic palm-branch. Several of Pindar's extant odes relate to victors in the Pythian Games.

Pythias. See DAMON.

Pythium, a genus of Fungi (q.v.). See DAMPING-OFF.

Python, a name applied to several large serpents, especially of the genus *Python*, which inhabit tropical Asia, Africa, and Australia, and closely resemble both in structure and habit the Boas of the New World. The body is rarely 20 feet in length, usually indeed nearer 10, though often estimated at 40; it is plump and very misshapen; the tail is prehensile; there are beside the arms two rudimentary hind limbs or 'spurs,' which have perhaps a sexual function besides being of use in

climbing. The pythons usually lurk near water, among the herbage or on an overhanging tree. They seize small mammals, strangle and crush them in their coils, and swallow them slowly. They do not cover them with saliva before beginning to swallow them, reports to this effect being inferences from the appearance of the occasionally disgorged prey. After a heavy meal the serpents are very lethargic. 'The animals on which the pythons ordinarily feed are seldom larger than a small dog, and though they may seize and overpower animals as large as a goat, to swallow them "horns and all" is absolutely impossible.' We must allow for about fifty per cent. of exaggeration in almost all the popular stories about pythons. It is true, however, that the mother reptile coils herself around her pile of eggs and incubates them for about three months. Among the pythons are the following: the Netted Python (*P. reticulatus*) of the Malay Archipelago, Burma, and Siam; *P. molurus*, the Adjiger of the Hindus; *P. regius*, the Royal Rock-snake of West Africa; *P. natalensis*, the Natal Rock-snake; *P. sebae*, the 'fetish' snake of tropical Africa; and several Australasian genera—e.g. *Morelia*, *Aspidiotes*. See ANACONDA, BOA.

PYX (Gr. *pyxis*, 'a box,' properly of boxwood), the sacred vessel used in the Catholic Church to contain the consecrated eucharistic elements which are preserved after consecration, whether for the communion of the sick or for the adoration of the faithful in the churches. It is sometimes called ciborium—a name, however, also given to the Baldachin (q.v.). The form of the pyx has varied very much at different times. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, how-

ever, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver. At present the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. Like all the other sacred utensils connected with the administration of the eucharist, it must be blessed either by a bishop, or by a priest delegated by a bishop.

PYX, TRIAL OF THE, the annual trial by weight and assay of the gold and silver coins of the United Kingdom issued from the mint during the preceding year. It is so called from the Pyx—i.e. box or chest—in which are deposited specimen coins. Before the coins are weighed into bags at the mint for issue to the public, two pieces are taken out of each 'journey-weight' (180 oz. Troy in the case of gold, and 720 oz. in that of silver coin), one for assay within the mint, the other for the pyx. The latter are sealed up and deposited in the chest or pyx. The pyx chest, having been brought to Goldsmiths' Hall in the custody of officers of the mint, is opened in the presence of a jury of goldsmiths, who proceed to examine the coins in regard to their number, weight, and fineness. The standard weights used, as well as the trial-plates, are produced by an officer of the Board of Trade. The weight of the total bulk is ascertained, as well as that of selected specimen pieces, and assays are taken from a bar formed by melting a number of coins as well as from separate coins. The verdict recording the results of these several trials releases the officers of the mint from their responsibility in regard to the coinage, and affords a public guarantee that the standard of the currency is well maintained. See ASSAYING, MINT.

Q

the seventeenth letter of our alphabet, descends from the nineteenth letter of the ancient Semitic alphabet, which represented a consonant sound peculiar to the Semitic languages, differing from *l* in being pronounced with constriction of the throat. The sound still

exists in Arabic, though in some dialects it is replaced by *tsh* or *q*. In popular modern transliterations it is rendered by *K*, as in the Hebrew names Korah, Hezekiah (the eleventh letter being in the English Bible rendered by *C* or *Ch*), and in the Arabic Koran. In learned transliterations it is commonly written *Q* or *K*. The name of the letter is in Hebrew *qaf*, in Syriac *qaf*, and in Arabic *qif*. The current conjectures as to the meaning of the name have no foundation. The earliest known form of the letter is *Phi*, whence through a series of intermediate forms the ordinary Hebrew *P* is derived.

The Greeks adopted the letter with the rest of the alphabet, usually employing the form *Q*, which is found in some Semitic inscriptions. As the true sound did not exist in their language, they used *koppa* and *kappa* (*K*) for the same sound; the former, as its name suggested, being chiefly employed before *O*. In the end *koppa* was found to be superfluous, and disappeared from ordinary use; but it long retained its place in the alphabet, and still later continued to be used as a numeral for 90.

The letter passed into the Roman alphabet in the form *Q*, which was afterwards altered into *Q* and *Q*. The printed capital, in all its varieties, differs only slightly from the Roman form. In minuscule writing the 'tail' was rendered more conspicuous by being made to descend

vertically below the line. The script capital *Q* was developed from *Q*, a natural way of writing *Q* without taking off the pen.

In Latin the letter, which had been an unnecessary member of the Greek alphabet, was made to serve a useful purpose. The Latin *V* expressed the two sounds *v* and *u*; in general, owing to the phonological characteristics of the language, this ambiguity caused no inconvenience, but to write the sounds *kv* and *ku* alike would have caused misunderstanding (e.g. the nominative *qui* would have been confused with the dative *cui*). The difficulty was obviated by writing *kv* as *QV* and *ku* as *CV*. As *Q* was not used in any other connexion, no inconvenience would have resulted from dropping the second letter of the combination, and using *Q* alone as the symbol of the complex sound *kv*. This simplification was not effected, and even in the modern European languages (with trifling exceptions to be noted afterwards) the letter is used only as part of the compound symbol (now written *qv*; in Swedish and Danish *qv*).

In Italian *qu* still retains its Latin value; in French, Spanish, and Portuguese it has the value

of *k*, and is the regular symbol for that sound before *e* and *i*.

In Old English *qu* was rarely used, the sound being normally represented by *cp* (*p=w*), which survived in occasional use till the 13th century. In the 12th century *qu* was reintroduced from French; until the 16th century it was occasionally written *qw* or *qv*. In modern English the final combination *que* (occurring in words adopted from French or imitating French spelling, as *antique*, *mosque*, *grotesque*) is pronounced as *k*, and *qu* is similarly pronounced in *conquer*, *liquor*, and their derivatives.

In certain Middle English dialects, chiefly Northern and North Midland, *qu*, *quh*, *quch*, *ghw*, *ghu*, *qh* were used to denote the sound of *wh*. In Scottish spelling *quh* survived into the 17th century.

The German *qu*, and the Swedish and Danish *qv*, have nearly the sound of *kv*, the second element approaching to *v*. In Dutch spelling *kw* is substituted.

The letter *q* occurs dissociated from *u* in the French words *coq* and *cinq*, and in certain French proper names, as *Vidocq*.

The Roman name of the letter, *qu*, has been preserved in all the languages that are written in the Roman alphabet.

Quack Doctors. Medical quackery is a product of all countries and of all ages; it flourishes among civilised and uncivilised communities alike, and was as rampant before the Christian era as it is in our own day. At all times it has found a numerous public ready and willing to be gulled, and this not only among the illiterate and vulgar, but even specially among the higher and better educated classes. In many cases royalty itself has set the fashion by lending its patronage to notorious charlatans. An exact definition of what constitutes medical quackery is not easy to give. The term 'quacksalver,' in use in the 17th century for quack doctor, seems to be derived from the Dutch *knakzalver* (Ger. *quacksalber*), meaning a person who praised loudly his own medicines or methods of cure. The first part of the word is derived from the well-known but unmusical note of the duck, and typifies the hoarse blarney tones in which itinerant medicine vendors are accustomed to laud their wares. The equivalent French term is *Charlatan*, derived from the Italian *ciarlare*, 'to chatter' (Lat. *circulāri*; *circulator*, 'a pedlar or mountebank')—a name which also indicates their characteristic and persistent loquacity. In more ancient days the loquacity and persistence were verbal; now they are both verbal and literary, as is shown in the deluge of advertisements with which medical quacks flood the world.

Quackery may be taken to include all devices—whether practised by legally qualified medical practitioners or by those who have had no recognised medical training—which tend to deceive the public by disseminating false ideas of disease, or a relief in imaginary ailments, which vaunt certain medicines or methods of treatment as panaceas or cure-alls, or which attribute to an individual a supernatural or exceptional power of influencing and curing disease. The element of pecuniary gain

or of personal vainglory also comes into a definition of quackery, as opposed to the singleness of purpose and devotion to the interests of the patient which are traditionally held to be the guiding principles of the orthodox practitioner of medicine. Perhaps the most amusing description of quacks and their methods has been given by Goldsmith in his *Citizen of the World*, and it is as true and as trenchant today as it was then. He says: 'Whatever may be the merits of the English in other sciences, they seem peculiarly excellent in the art of healing. There is scarcely a disorder incident to humanity against which they are not possessed with a most infallible antidote. The professors of other arts confess the inevitable intricacies of things, talk with doubt, and decide with hesitation. But doubting is entirely unknown in medicine; the advertising professors here delight in cases of difficulty; be the disorder ever so desperate or radical, you will find numbers in every street, who, by levelling a pill at the part affected, promise a certain cure without loss of time, knowledge of a bedfellow, or hindrance of business. When I consider the assiduity of this profession their benevolence amazes me. They not only in general give their medicines for half value, but use the most persuasive remonstrances to induce the sick to come and be cured. Sure there must be something strangely obstinate in an English patient who refuses so much health upon such easy terms.'

The Sieur de Comval, writing in 1610, gives a lamentable account of the way in which France, Germany, and Italy were overrun with medical quacks in his day. He describes them as being apostates, vagabonds, disgraced clergy, women of loose character, and rascals of all kinds, and says that they are more dangerous to mankind than vultures, for the latter devour only the dead, while the former prey upon the living. Cadet de Gassicourt, classified quack doctors in a whimsical manner in groups, families, and species, of which the following is an abridgment. *Circulatores* Insects, very venomous, of the order of suckers; common everywhere, found in all countries and all latitudes. Their external characters are very varied. Some have brilliant elytra, velvety, and studded with gold; others have them more coarsely formed, dull, not entire, and marked with rents. Their intestines have an enormous capacity, the heart is wanting or very small; they attack man exclusively, their stings being always injurious and sometimes mortal. The sting is sometimes very evident, sometimes quite hidden or little apparent. He divides them into two great groups, the *Circulatores Phanerorhynchi*, or peripatetic quacks who practise in public, and the *Circulatores Cryptorhynchi*, or *Charlatans en Chambre*. The latter are described as 'the charlatan of the aristocracy, of the bourgeoisie, and of those who do not wish to be seen consulting him in public. This honest son of toil is imbued with a sense of his own importance, his language is sententious, he speaks with assurance, and is lodged luxuriously. He is often a specialist,' and so on. These two groups are further largely subdivided, and an amusing description given of each species.

The methods of quack doctors have been the same from all time, and consist principally in attracting and impressing public attention by extraordinary surroundings and behaviour, and in loudly and persistently asseverating the virtues of their nostrums. This is essentially advertising; and while the invention of printing has stimulated many industries, there are few which it has benefited to a greater extent than that of the quack doctor, as it at once opened the way to a much wider public. The enormous modern spread of newspaper reading has further been largely turned by

the quack to his own advantage, as it opens up a still wider field for the puffing of his wares. When once public attention has been caught, the battle is more than half won; patronage, popularity, and success follow almost as a matter of course. Fortunately these are frequently of a very temporary character; but, as quack doctors are essentially a migratory tribe, this drawback troubles them comparatively little. When they return to their old haunts a new crop of dupes is certain to have come up. The success of quacks must be attributed largely to an imperfect knowledge among the general public of what constitutes disease, added to which there is often an implicit faith in the curative power of drugs. There is little popular conception of what is possible or impossible in the way of healing, and thus the most absurd and extravagant statements are received as facts. Their success, however, has a deeper origin—viz. in the most potent of all human passions—the desire to preserve life. The strong desire for life, health, and the relief of pain clouds the judgment and causes the chance of relief from any source to be eagerly grasped at. The popular love of the marvellous and mysterious has also been of great assistance in pushing the fortunes of many quacks.

Quack medicines, as a rule, form no real additions to our means of treating disease. Almost without exception they are formulae taken from some old or modern pharmacopœia, or the prescription of some well-known physician, christened with a name calculated to strike the popular fancy, and then puffed and advertised into fame. Such remedies are to be found for every real and imaginary ailment of mankind; but the happy hunting-ground of the quack is more especially in the regions of chronic, but not fatal, disease, such as the multifarious rheumatic affections, chronic skin affections, asthma, hysteria, hypochondriasis, 'nervous disorders,' and a host of others. Persons afflicted with such ailments have naturally alternations of good, bad, and indifferent health, and are often very prone to attribute what is simply natural improvement to the action of the remedy last taken. It is such people who certify so confidently and so gratefully to the curative powers of quack medicines. Cures for cancer, sterility, and consumption, various elixirs of life and youth, and single antidotes efficacious against all poisons must alone have made the fortunes of many thousands of quack doctors. The sad part of the whole matter is that mankind never seems to learn by experience; no new methods of deception are introduced, no real originality or inventive enterprise is ever shown by quacks; they rely upon exactly the same old artifices as their predecessors did, and generation after generation are duped by them just as surely.

Quadragesima ('fortieth') is the Latin name for the whole season of Lent, with its forty days (so also its French derivative, *carême*); but the name is commonly assigned to the first Sunday in Lent, by analogy with the three Sundays which precede Lent—Septuagesima, Sexagesima, and Quinquagesima (q.v.).

Quadrant (Lat. *quadrans*, 'a fourth part'), literally the fourth part of a circle, or 90°; but signifying, in Astronomy, an instrument used for the determination of angular measurements. The quadrant consisted of a limb or arc of a circle equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. Picart was the first to apply telescopic sights to this instrument. Quadrants were adjusted in the same way as the Mural Circle (q.v.). Various innate defects of the quadrant—such as the impossibility

of securing exactness of the whole arc, concentricity of the centre of motion with the centre of division, and perfect stability of the centre-work—led to its being superseded by the repeating circle, otherwise called the mural circle. *Hadley's Quadrant* is more properly an *octant*, as its limb is only the eighth part of a circle, though it measures an arc of 90° . Its principle is that of the Sextant (q.v.). For the quadrant electrometer, see ELECTRICITY.

Quadratic Equations. See EQUATIONS.

Quadrature. The 'quadrature' of a plane curve is effected when a square is found which has the same area as the given curve. Practically it is effected when any rectilinear figure of equal area has been found, for it is easy then to obtain the equivalent square. The quadrature, regarded as an arithmetical process, consists in finding the area of the curve in terms of any square unit.

The great problem in quadrature has been the *Quadrature of the Circle*. The workers in this subject may be divided broadly into two classes: (1) trained mathematicians, who clearly understand the nature of the problem and the difficulties which surround it; (2) those who do not understand the nature of the problem or its difficulties, and who think that they may, by good fortune, succeed where others have failed. The number of the workers of the second class became greatly diminished when the search for 'perpetual motion' became general. And, at the present day, the ranks (now fortunately small) of the perpetual-motionists and the circle-squarers are almost entirely composed of unfortunate individuals whose mental capacities are small, in too many cases the impairment of their faculties having been brought about by a development of their fruitless idea into monomania. Apart from its great historical interest to the mathematician, the subject scarcely merits detailed notice, except in so far as such notice may be useful in preventing further waste of mental energy by some who, were their energies properly directed, might succeed in increasing the sum of useful knowledge.

The nature of the problem may be understood from the following brief account. Let an equiangular n -gon be inscribed in a circle, and let its corners be joined to each other and to the centre. The area of each triangle so formed is $\frac{1}{2}ar \cos \theta$, where a is the base of the triangle, r is the radius of the circle, and θ is one-half of the vertical angle. Hence the area of the polygon is $\frac{1}{2}nar \cos \theta$; and this can be made as nearly equal to the area of the circle as we please by making n sufficiently large. In the limit, when n is infinite, the two areas are equal. But, when n is infinite, θ vanishes and na becomes the circumference, c , of the circle. Hence the area of the circle is $\frac{1}{2}cr$; that is to say, it is equal to the area of a triangle erected on the radius of the circle as base and of height equal to the circumference of the circle.

The arithmetical quadrature of the circle would therefore be effected if we could find the value of the ratio of the circumference to the diameter—that is, the value of π in the equation $c = 2\pi r$. The geometrical quadrature would be effected by finding a geometrical method of drawing a straight line equal in length to the circumference.

It has long been known that the arithmetical solution of the problem is impossible, for it has been proved that the quantity π is *incommensurable*. And proofs have been advanced that the geometrical quadrature is also impossible; but these proofs are by no means simple, and do not always convince those who are able to judge of their accuracy. James Gregory, in 1668, gave a proof of the impossibility of the geometrical quadrature which Huygens, although he at first objected

to it, finally admitted in so far as it applied to any sector of a circle. Newton also gave a proof of this limited problem, but his proof is not conclusive. A rigid proof has now been given by Lindemann that π cannot be the root of a rational algebraic equation, and therefore cannot be found geometrically. Still, apart from such proofs, the mere consideration of the fact that (discounting incapable workers) the question has been fruitlessly attacked by the ablest mathematicians of past centuries should be sufficient to deter any reasonable person from engaging in the quest. Any mathematician who now considers the question seeks not for a solution but for a simple and convincing proof that a solution is impossible. (It must be remembered that a 'geometrical' solution means a solution which involves no more postulates than those of Euclid.)

Archimedes was the first to give a practical measurement of the quantity π . By a consideration of the inscribed and escribed 96-gons he proved that it lies between $3\frac{1}{8}$ and $3\frac{1}{4}$. This result is correct only to the second decimal figure. Two Hindu measurements are 3.1416 and 3.1623 . Ptolemy gives 3.141592 . A great improvement on previous results was made by Adrien Anthonisz in the 16th century. His result was correct to the sixth decimal place inclusive. It was published by his son, Adrien Metius, in 1625. Vieta gave the result correct to the ninth decimal place inclusive; Adriaens Romanns gave it correct to the fifteenth; and Van Ceulen gave it to the thirty-sixth. Snell introduced considerable improvements in the method, and gave 55 decimal figures. Abraham Sharp gave 75, Machin 100, De Laguy 128, Vega 140. The latter result is only correct to 136 places. Montucla cites an Oxford manuscript in which the result (given to 154 places) is correct to 152 places. In 1846 Dase gave a result with 200 decimals, and in the following year Clansen gave 250. In 1851 Shanks gave 315, which were extended by Rutherford to 350, and shortly afterwards (in 1853) Shanks gave 530, which he extended to 707. His calculation seems to have been verified by Richter to five hundred places. An interesting experimental method was adopted by R. A. Smith. He tossed a thin rod upon a uniformly planked floor, the length of the rod being three-fifths of the breadth of a plank. If l be the length of the rod, while b is the breadth of a plank, the probability of the rod intersecting a seam is $2l/b\pi$. From the result of 3204 tosses he found $\pi = 3.1412$. The true value to 20 places is 3.14159265358979323846 .

For a more detailed historical account, see De Morgan's *Budget of Paradoxes* (rev. ed. 1915), or E. W. Hobson's *Squaring the Circle* (1913); see also CIRCLE.

Quadratures, METHOD OF. This name is applied to any arithmetical method of determining the area of a curve. When the exact area is known, a square whose area is equal to it can be found—hence the term 'quadratures.'

It has been shown, under the heading CALCULUS, that the area of a curve whose equation is $y=f(x)$ is $\int y dx$, and can therefore be found when the integral can be evaluated. Hence the approximate determination of the value of a definite integral is obtainable by the method of quadratures.

Let it be required to find the area bounded by a portion of a curve, the ordinates at its extremities, and the axis. The usual method of procedure is to divide the portion of the axis which is included between the two ordinates into a number of equal parts, and to erect ordinates at the points so obtained. The area is approximately equal to the product of one of the given equal parts into half of the sum of the two extreme ordinates

together with the sum of all the intermediate ordinates. To obtain a very accurate result by this process the number of equidistant ordinates must be so great that the portions of the curve which are intercepted by successive ordinates are very nearly straight.

A better method, due to Simpson, consists in drawing, through the first, second, and third points obtained as above on the curve, a parabola whose axis is parallel to the ordinates, and repeating this process with the third, fourth, and fifth points, and so on—the points being chosen so that the total number of points is even. The area of the given curve will be approximately equal to the sum of the areas of the various portions of the parabolas included between successive ordinates when these ordinates are sufficiently close together. It is therefore approximately equal to one-third of the product of one of the given equal portions of the axis into the sum of the extreme ordinates together with twice the sum of all the odd intermediate ordinates and four times the sum of all the even intermediate ordinates.

When the successive equidistant ordinates are very close together, the area is approximately equal to the product of the common intercept on the axis between successive ordinates into the sum of all the ordinates. The labour involved in the estimation of an area by this process would be fatal to its employment unless the number of ordinates was small. But, if the ordinates were few in number, considerable error would in general result unless a correction could be applied. This method is adopted in that process which is known as *the method of quadratures par excellence*, and which is as follows: Let y_0, y_1, \dots, y_n be the several equidistant ordinates, and let a be the intercept on the axis between y_0 and y_n . Also let s be the sum above referred to; and let $\Delta y_0 = y_1 - y_0$, $\Delta y_1 = y_2 - y_1$, &c.; $\Delta^2 y_0 = \Delta y_1 - \Delta y_0$, $\Delta^2 y_1 = \Delta y_2 - \Delta y_1$, &c.; and so on. The value of the whole area is (not s , but)

$$s - \frac{1}{2} \frac{a^2}{n} (\Delta^2 y_0 + \Delta^2 y_n) - \frac{1}{24} \frac{a^3}{n^2} (\Delta^3 y_0 - \Delta^3 y_n) \\ - \frac{1}{720} \frac{a^4}{n^3} (\Delta^4 y_0 + \Delta^4 y_n) - \frac{1}{30240} \frac{a^5}{n^4} (\Delta^5 y_0 - \Delta^5 y_n), \text{ \&c.}$$

It will not in general be necessary to proceed beyond the fifth difference. As an example we shall find the area of the curve $y = x^3$ between the limits $x = 10$ and $x = 15$. In this case all differences beyond the third vanish, and $a/n = 0.5$ if we make eleven ordinates in all. The following table represents the results:

	x	y	Δy	$\Delta^2 y$	$\Delta^3 y$
0	10	1000	157.625	15.75	0.75
1	10.5	1157.625	173.375	16.5	0.75
2	11	1331	189.875	17.25	0.75
3	11.5	1520.875	207.125	18	0.75
4	12	1728	225.125	18.75	0.75
5	12.5	1953.125	243.875	19.5	0.75
6	13	2197	263.375	20.25	0.75
7	13.5	2460.375	283.625	21	0.75
8	14	2744	304.625	21.75	0.75
9	14.5	3048.625	326.375		
10	15	3375			

Hence we have $s = 22515.625 \times 0.5 = 11257.8125$; $\frac{1}{2} \times 0.5 \times (y_{10} + y_0) = 1093.75$; $\frac{1}{24} \times 0.5 \times (\Delta^3 y_0 - \Delta^3 y_n) = 6.61458$; $\frac{1}{720} \times 0.5 \times (\Delta^4 y_0 + \Delta^4 y_n) = 0.78125$. We therefore get by this method, approximately, for the value of the area, the quantity 10156.67. The correct value is 10156.25, and so the error is less than one in twenty thousand.

This method is of extreme utility in the evaluation of definite integrals when rigorous processes are not attainable.

Quadriga. See CHARIOT.

Quadrilateral, a figure enclosed by four straight lines. The name is given in history to the four fortresses of North Italy—Mantua, Peschiera, Verona, and Legnago—which form a sort of outwork at the bastion of the mountains of Tyrol, and divide the north plain of the Po into two sections by a most powerful barrier. They figured in all the later wars fought in North Italy, especially those of Austria. Russia had a similar combination of four fortresses in Poland—Warsaw, Nowogorogiewsk, Ivangorod, Brześć-Litewski—called the Polish Quadrilateral.

Quadrille, a dance of French origin, introduced about 1808 into England. It consists of consecutive dance movements, generally five in number, danced by four or more couples, opposite to, or at right angles to, each other. See DANCING.

Quadrille, a game of cards, very fashionable about two centuries ago. It was very similar to the Spanish game of Ombre (q.v.), with the necessary alterations to fit it for a four-handed game. When whist came into fashion after 1740 quadrille began to lose favour.

Quadrivium. See AKTS.

Quadruple Alliance, a league formed in August 1718 between England, France, Austria, and Holland to counteract the ambitious schemes of Alberoni. It was made upon the basis of the Triple Alliance which was formed in the January of 1717 between England, Holland, and France, and by which the clauses in the treaty of Utrecht having reference to the accession of the House of Hanover in England, the renunciation by the Spanish king of his claims on the French throne, and the accession of the House of Orleans to the French throne should the young king, Louis XV., die without issue, were guaranteed. The Spanish fleet was destroyed by Byng off Cape Passaro, while the French crossed the Pyrenees and inflicted several defeats upon the Spaniards; and at length Philip was compelled to dismiss his ambitious minister, and accept the terms of the Quadruple Alliance, 19th January 1720.

Quæstor, a class of Roman magistrates, reaching as far back, according to some writers, as the period of the kings, but probably not older than the consulate. The Twelve Tables speak of the *quæstores parvædii* ('investigators of murder,' ultimately public accusers), who were two in number, and conducted the prosecution of persons accused of murder, although their jurisdiction probably extended to other crimes. They are identified on good authority with the more important though later magistracy the *quæstores urbani*, who possessed certain criminal jurisdiction during most of the republican period, and to whom was entrusted the charge of the public treasury. At first they were only two in number, but in 421 B.C. two more were added to accompany the consuls into the provinces. In 267 B.C. the number was increased to eight, the four additional quæstors being the *quæstores classici*, who were stationed at various points on the coast of Italy, and entrusted mostly with naval matters. As province after province was added to the Roman Republic they amounted in the time of Sulla to twenty, and in the time of Caesar to forty, but were again reduced to twenty under the empire. On its first institution the quæstorship (*quæstura*) was open only to patricians; but after 421 B.C. plebeians also became eligible.

Quagga (*Equus quagga*), a species of striped wild horse, peculiar to Africa, and nearly related to the zebras. Formerly found in profusion south of the Vaal River, beyond which its range seldom extended, it is believed to be now quite extinct. The illustration represents the last animal

of its species owned by the Zoological Society; it was sent from the Cape by Sir George Grey in 1858. The quagga was a handsome animal, more strongly built than the mountain zebra and Burchell's zebra. The upper parts of the body were dark

Equus quagga

(From a Photograph by Messrs York & Son, London.)

rufous brown, becoming gradually more fulvous, and fading to white at the rump and ventral surface, the dorsal line dark and broad, widening over the crupper. The head, neck, mane, and shoulders were striped with dark brown, gradually waxing fainter till lost behind the shoulder. It was usually found in herds of from ten to a hundred, but often seen in troops of many hundreds on the plains of the Orange Free State and Cape Colony, and often associated with the white-tailed gnu, not seldom with ostriches. The quagga was swift and enduring, but could be run down by a first-rate horse. Its extinction was mainly wrought by the Orange Free State and Transvaal Boers, who slew thousands annually for their skins. In the old days it was tamed with success, was more tractable than the zebra, and even bred in captivity. The term Quagga is a corruption of the old Hottentot name *Quacha*, bestowed in imitation of the peculiar barking neigh of this quadruped. The quagga is not to be confounded with Burchell's zebra, which is often erroneously called quagga by hunters of the South African interior.

Quail (*Coturnix*), an Old-World genus of the Partridge family (Percidae), ranging over the temperate Palearctic, Ethiopian, and Oriental regions, and in the Australian region to New Zealand. The quails are the smallest of the partridge family. Six species are described in this restricted genus. The best known is the Common Quail (*Coturnix coturnix*). In size it is about 7½ inches long; the general colour above is brown, varied with buff, and on the under parts buff. The male is somewhat smaller in size, is brighter, and has a reddish throat and two dark-brown bands descending from the ear-coverts and ending at the throat in a blackish patch acquired at the second year. Quails fly rapidly, and take long and fatiguing journeys. Immense flocks visit the countries bordering the Mediterranean, especially during the spring emigration; and they are caught for food in large numbers—17,000 have been brought to Rome in one day, and in the small island of Capri, in the Bay of Naples, over 160,000 have been netted in a single season. Many remain to breed, but the majority pass northwards. In England quails are spring visitors; they are becoming scarcer, but at times there is a great influx. Northwards the numbers are fewer, but nests have been found in the northernmost mainland of Scot-

land, and in the Orkneys, Shetlands, and Outer Hebrides, and in summer they reach the Faeroe Islands. A few remain on the south-west coast of England and in Ireland during winter, but the majority leave in October; many pass the winter in the south of Europe and in North Africa; and the species is resident in the Canaries, Madeira, and the Azores. It is also found at the Cape, in

Madagascar and Mauritius, and in Egypt, while in Palestine, as of old (Exod. xvi. 13), quails come up at night and cover the land. It ranges to India and China, and passes the cold season in those countries. Its flesh is considered a delicacy, and in the countries they commonly visit the arrival

Common Quail (*Coturnix vulgaris*).

of the quails is eagerly expected. Quails feed chiefly on insects and slugs, but also on grain and seeds, and they seek their food in the evening. In habit they are unsocial, inamiable, and pugnacious with their own species. They are partly polygamous, partly monogamous. The female is, however, an excellent and careful mother. She builds her nest of bits of plants, and lays from seven to fourteen eggs, pea shaped, light brown in colour, with dark shading. The young are full grown in six weeks, and two heaves may be reared during the season. The call-note of the male is three-syllabled, and from it the quail is known as 'wet-my-lips,' or 'wet-my-feet,' and the species has also for the same reason been named *C. dactylisomus*. The Button-quails, a different group, including twenty species or more ranged under the genus *Turnix* or *Hemipodis*, are distributed in Barbary and in the Ethiopian, Indian, and Australian regions. Australia possesses a genus, *Synoicus*, peculiar to itself, which includes four species. The American Quails, of which there are about fifty or sixty species, are included in the family or subfamily Odontophoridae, and differ in habit from all the Old-World forms in perching upon trees. The Virginian Quail (*Ortyx virginianus*), known as the Partridge and the Bob-White, from its calling note, and the Californian Quail (*Lophortyx californica*) have been introduced into England as game birds, but they have not yet become resident there.

Quain, an Irish family of distinction. (1) JONES QUAIN (1796-1865), born at Mallow, Co. Cork, studied medicine at Dublin and Paris, and in 1829 was appointed lecturer on Anatomy and Physiology in the Altdersgate School of Medicine, London. Two years later he was made professor of Anatomy and Physiology at London University, and held that post until 1835. The well known students' text-book, Quain's *Elements of Anatomy*, was originally written by him (first edition, 1828). He published also a series of elaborate *Anatomical Plates* (1858) and a translation of Martine's *Pathology* (1835). (2) RICHARD QUAIN (1800-1887), brother of the above, was born at Fermoy, Co. Cork, studied at London, and was appointed professor of Anatomy and Clinical Surgery in University College, London, in 1837. He was surgeon-extraordinary to the Queen, and was elected president of the Royal College of Surgeons

in 1868. Amongst his works the principal are: *Anatomy of Arteries*, with folio plates (1845), *Diseases of the Rectum* (1854), *Observations on Medical Education* (1865). He edited, along with others, the fifth edition of (Jones) *Quain's Anatomy*. By his will he left nearly £75,000 to University College, London, for the 'education in modern languages (especially English) and in natural science.'—(3) SIR RICHARD QUAIN, first-cousin to the above, was born at Mallow on 30th October 1816. He was Lumsian lecturer at the Royal College of Physicians (*Diseases of the Muscular Walls of the Heart*) in 1872, and Harveian Orator (*The Healing Art in its Historic and Prophetic Aspects*) in 1885, and was made physician-extraordinary to the Queen. He edited the *Dictionary of Medicine* (1882); and contributed to various medical journals. He became president of the General Medical Council in 1891, was created a baronet the same year, and died 13th March 1898.—(4) SIR JOHN RICHARD QUAIN, born at Mallow in 1817, the half-brother of Jones and Richard Quain, was made a judge of the Court of Queen's Bench in 1871, and justice of the High Court of Judicature in 1875. He died 12th September 1876. Along with H. Holoyd he published *The New System of Common Law Procedure* (1852).

Quakers. See FRIENDS.

Quantification of the Predicate, a phrase belonging to Logic, and introduced by Sir W. Hamilton. According to the Aristotelian Logic, propositions are divided, according to their *quality*, into affirmative and negative, and, according to their *quantity*, into universal and particular ('All men are mortal,' 'Some men live eighty years'). If we combine the two divisions we obtain four kinds of propositions. But the proposition 'All men are mortal' is not fully stated: the meaning is, that all men are a *part* of mortal things, there being (possibly and probably) other mortal things besides men. The complete proposition is to this effect: 'All men are *some* (or part of) mortals,' where quantity is assigned, not only to the subject, but also to the predicate. The first result of stating the quantity of the predicate is to give eight kinds of propositions instead of four; the next result is to modify the process called the Conversions of Propositions. *Limitation* (All A is B, *some* B is A) is resolved into simple conversion, or mere transposition of premises without further change. 'All A is *some* B'; 'Some B is all A.' See the article LOGIC.

Quantoicks. See SOMERSETSHIRE.

Quantum Theory. In its scientific use the word quantum has the meaning of an allotted fixed amount, and is limited to specify an amount of Energy (q.v.) or its time-integral.

The quantum theory originated at the commencement of the present century, and now shares with the relativity theory a position of dominance in the theoretical formulation of physical science. It is the definite outcome of the gradual pushing of physical inquiry into the field of atomic and sub-atomic actions. If these actions are involved directly in the emission and absorption of light, we might expect that characteristics of them would be impressed markedly upon the phenomena of light; and, for more than half a century now, the existence of this impress has been recognised and inquired into. As a result of these investigations chemistry was supplied with one of its most recently developed methods of analysis, Spectrum Analysis (see SPECTRUM). In that case it is the *selective* emission or absorption of light that is dealt with; but the impress appears also in the law of distribution of the energy amongst the wave-lengths, even when the radiation observed is that from a 'black' body possessing no selective action at all.

The law of black-body radiation was found experimentally, but no useful formulation was practicable until a theoretical determination of it was made and tested. Even before that was done the nature of radiation was known to be inconsistent with accepted physical principles. If Maxwell's doctrine of the equipartition of energy amongst different degrees of freedom were true, the ratio of the specific heats of a gas should have a very different value from those which actually exist; for the observed spectra of gases exhibit the existence of many freedoms, while the observed values of the specific heats necessitate a small number only. Hence Kelvin, in speaking of this condition as one of two 19th-century clouds on the doctrine of heat, was led to deny the doctrine of equipartition; and he was right in so far as radiation is concerned. But Maxwell's demonstration of the doctrine was sound if Newtonian dynamics be accepted. The true condition is found to be that the sub-atomic motions are not governed by the Newtonian laws, but by very different conditions.

Wien first gave a law of radiation founded on certain postulates, and, later, Planck deduced the same law in a more rigid manner. But observation showed that it deviated from fact at long wave-lengths, though at short wave-lengths it suited well. Planck then modified Wien's law of radiation in a way which made it accord with observation; and, soon after, gave the deduction of the modified law, now known as Planck's law, on an entirely fresh basis, which gave the first expression of the quantum hypothesis. There is still some doubt as to the complete accuracy of Planck's law of radiation, but there can be no doubt as to the general success of the postulate, that energy, in its passage to or from the atom, is transferred not continuously but in discrete quantities of definite magnitude. In radiation these quantities are proportional to the frequencies of the vibrations; and this shows, as Planck pointed out, that there exists a more fundamental quantum than the quantum of energy. For the law of proportionality shows that the product of the quantum of energy emitted into the periodic time of emission has the same constant value for all radiations; that is to say, the time-integral of the energy emitted during the complete period of a vibration is absolutely constant for radiation of all periods. This integral is called the 'action': so the law indicates that *action* is asserted in absolutely fixed quanta. This amount, a constant of nature, is known as Planck's constant, and is denoted by the letter *h*. The quantum of *energy*, given by the equation $\epsilon = h\nu$, where ν is the frequency, is only constant for any one definite frequency of radiation.

The idea that radiation exists in the æther in definite quanta is directly opposed to the idea of the continuous wave-front entertained in the undulatory theory of light; and no evidence of the existence of these discrete quanta has ever been found even by the most delicate methods based upon interference. The known laws of interference are actually the wave theory laws. On the other hand, certain phenomena of the ionisation of a gas by Röntgen rays, which are radiation of short wave-length, and of photo-electric and other actions, are entirely in accordance with the quantum view.

Indeed many physical phenomena indicate that quanta of energy are involved in other actions than in those of radiation. The quantum theory has in fact been no less fruitful in the elucidation of physical phenomena than has the theory of relativity.

It has given an accurate evaluation of the chemical constant of monatomic gases; and, by taking account of quanta in the rotational

energy of molecules, it has accounted for the infra-red absorption spectra of polyatomic gases, and largely for the molecular heat of diatomic gases. Similar success has attended its applications in the region of the atomic heats and the thermal and electric conductivities of solids. Perhaps the most wonderfully accurate of all its results lie in the domain of the fine structure of bright-line and Röntgen emission spectra.

The theory has registered some failures, but these seem rather to be due to the absence of sufficiently accurate knowledge of the structure of atoms than to any intrinsic defect of the theory. At present interest centres most round the elucidation of the enigma presented by the simultaneous needs for a discontinuous and a continuous propagation of radiation.

Quarantine (from the Fr. *quarantaine*, 'a period of forty days') is a forced abstinence from communication with the shore which ships are compelled to undergo when they have come last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, are or have been raging. Where a quarantine is established it is a punishable offence for any person in the suspected ship to come on shore, or for any one to disembark any merchandise or goods from her, except at lazarettos, which are establishments provided for the reception of goods or passengers or crew, and where such purifying processes as the sanitary science of the time prescribes are applied. Until a ship is discharged from quarantine she exhibits a yellow flag at the mainmast-head if she has a clean bill of health, and a yellow flag with a black spot if not clean. Quarantine is not of necessity limited to a sea frontier; and it is enforced at the frontiers between contiguous states. Quarantine for maritime intercourse was established by the Eastern emperors in the 6th century and by the Venetians in 1127, but the practice must have been greatly older on land-frontiers; the precautions of the Jews against leprosy were a species of quarantine. So far as it is in use in Britain, the Public Health Amendment Act, 1896, placed it under the control of the Local Government Board (now the Ministry of Health). But it has practically been superseded by medical inspection, a detention of suspected persons in hospital, and the disinfection of the ship. The Act of 1896 applied only to yellow fever, plague, and cholera, but since 1921 the port sanitary authorities may interfere in respect of any infectious disease. See BILL OF HEALTH, PRATIQUE.

Quaritch, BERNARD (1819-99), bookseller and collector, was born at Worbis, Prussian Saxony. He went to London in 1842, and there won for himself a premier place in the old book trade. Quaritch published the earlier editions of Fitz-Gerald's *Omne Khegygan*. His Catalogues, especially those of 1880 and 1887-88 (suppl. 1894 and 1897) are important bibliographically.

Quarles, FRANCIS, a minor religious poet, belonged to a good Essex family, and was born at the manor-house of Stewards near Romford in 1592, being baptised on 8th May. He studied at Christ's College, Cambridge, and at Lincoln's Inn, and was successively cup-bearer to the Princess Elizabeth, secretary to the famous Archbishop Ussher, and, like Middleton and Ben Jonson, Chronologer to the City of London (1639). He married in 1618 a wife who bore him eighteen children, and pruned shortly after his death a touching short memoir, prefixed to *Solomon's Recantation* (1645). Quarles was a bigoted royalist and churchman, suffered losses and calumny in the cause, and died 8th September 1644. He wrote abundantly both in prose and

verse, and his books were extraordinarily popular in their day. Nor are his *Devine Emblems* and *Euchiridion* entirely unworthy of their reputation. Pope's lines in the *Dunciad* are familiar to every one:

Or where the pictures for the page alone,
And Quarles is saved for beauties not his own

But the clever gibe is not entirely justifiable, for the *Emblems* (1635), in spite of verbose and dull if edifying moralising, helpless bad taste, not infrequent bathos, and ever present monotony, shows wealth of fancy, excellent good sense, felicity of expression, and occasionally a bright though intermittent flash of the true poetic fire. And the *Euchiridion* (1640), a collection of short essays and meditations, affords many an example of compact and aphoristic prose, while its antithesis and word-play are often effective and sometimes fine.

The only complete edition is that by the Rev. A. B. Grosart in the 'Chertsey Worthies Library' (3 vols. 1880-81).

Quartan Fever. See MALARIA.

Quarter, a measure of weight, equal to the fourth part of a hundredweight i.e. to 28 lb. avoirdupois. As a measure of capacity, for measuring grain, &c., a quarter contains 8 bushels. This latter quarter, however, the Corn Sales Act abolished as a standard for the sale of dry produce, the hundredweight alone being legal since 1st January 1923.

Quarter-day. See TERM.

Quarter-deck, that part of the upper deck which extends from the mainmast or gangway amidships to the poop, or where there is no poop, to the stern; in turret and barbette war-ships it generally extends from the after-turret or barbette to the stern. It is the place of honour, and is considered the 'King's or Queen's Parade'; and every officer and man stepping upon it salutes it, as a mark of respect to the majesty of the throne. There is a theory that the practice points to the former presence of a crucifix. 'H.M. quarter deck' is used as a promenade by officers only, at sea the weather side, and in harbour the starboard side being reserved for senior officers. Persons of distinction and officers are received on the quarter-deck; and when the captain addresses the men, or confers rewards or honours on any individual, it is on the quarter-deck that the officers and men fall in for the purpose.

Quartering. See HERALDRY; also EXECUTION, TREASON.

Quarterly Review. John Murray, conscious of the growing power and influence of the *Edinburgh Review*, and strongly disapproving of its Whig opinions, set about the organisation of a work which should counteract what he believed to be its dangerous tendencies. Accordingly, in September 1807, he wrote to Canning with a view of securing his interest. Through his cousin, Stafford Canning, Murray was introduced in January 1808 to Gifford (q.v.), who became its first editor. In October 1808 Murray secured the assistance and co-operation of Scott, whose *Marmion* had been severely reviewed in the *Edinburgh* (1808). Scott not only wrote to his brother Thomas, C. K. Shaple, Morritt, and Sonthey, on behalf of the first number, but sent a letter of advice to Gifford, and became himself a considerable contributor. The first number, rather more literary than political in tone, appeared at the end of February 1809. An edition of 4000 was sold at once, of which 850 went to Ballantyne in Edinburgh. The publisher bravely persevered, and, though up to the fifth number not one had paid its expenses, by 1817 it was an assured success, 14,000 being printed. Gifford, who suffered from ill-health, proved unpunctual, resigned the

editorship in 1824, and was succeeded first by John T. Coleridge, then by John Gibson Lockhart (q.v.). Murray's original offer to Gifford as editor was 160 guineas a number for contributions, and £200 a year as editor; when he invited Lockhart to London his offer was £1000 a year, which could be made £1500 by contributions, and a share for three years, the profits of which would not be worth less than £1500 per annum. Besides Scott and Southey, George Ellis, Heber, Barrow, Croker, and Captain Head were considerable contributors. Croker had 99 articles in the first 100 numbers. A frequent rate of payment to Scott and Southey was £100 per article. See SMILES, *A Publisher and his Friends* (2 vols. 1891), and articles BOOK-TRADE, MURRAY (JOHN), PERIODICALS, and SCOTT.

Quartermaster. In the British army the *quartermaster-general* is a staff-officer of high rank (usually a major-general), and ranks after the chief of the general staff and the adjutant-general as the third military member of the Army Council. He is the head of the department of the quartermaster-general to the forces, having charge of transport and remounts, army veterinary services, movements and quartering, and supplies and clothing, with a complete staff to attend to these duties. There are also officers with the rank of assistant quartermaster-general and deputy assistant quartermaster-general for the different subordinate commands. The army in India has a similar staff for these duties, and so has every division. In a brigade the duties fall upon the brigade major. A *quartermaster* is an officer, with the rank of lieutenant, on the staff of a depot, a cavalry regiment, or an infantry battalion, charged with the care of stores, issues of clothing, food, forage, and fuel, allotment of barracks, tents, &c., but has no control over monetary matters. Nor is he permitted to undertake any of the duties of paymaster or to preside over mess or other regimental committees having charge of funds. Several are employed, at the War Office and elsewhere, on duties different from those mentioned above, on special rates of pay. A *quartermaster sergeant* assists the quartermaster in a regiment or battalion.

In the navy the *quartermasters* are generally petty officers; at sea they are stationed at the *con*, their duty being to take care that the helmsmen keep the ship on her proper course, and also to see that all orders from the officer of the watch affecting the movements of the helm are promptly and correctly carried out; they also assist in taking readings of the log and in taking soundings when necessary. In harbour they keep regular watch at the gangways, looking out for boats arriving and leaving, and conveying the necessary orders for the carrying out of the work of the ship. Their pay depends upon their gunnery or torpedo qualifications, number of good-conduct badges, &c.

Quartern is a term employed in some parts of Great Britain to designate the fourth part of a peck; in liquid measure it is the fourth part of a pint, and so synonymous with the imperial gill. A quartern loaf generally weighs 4 lb.

Quarter Sessions, a court of Justices of the Peace (q.v.) established in 1350-51, and meeting once a quarter. Most of their administrative duties were in 1888 transferred to the County Councils (see COUNTY).

Quarter-staff, once a favourite weapon with the English for hand-to-hand encounters, and still sometimes used in athletic exercises, is a stout pole of heavy wood, about 6½ feet long, often bound with iron at both ends. It is grasped in the middle by one hand, the other holding half-way between the middle and end (hence apparently the name 'quarter-staff'); and the attack is made by

giving it a rapid circular motion, which brings the loaded ends on the adversary at unexpected points. See *Broadsword and Singletuck*, by Allanson-Winn and Philipps-Wolley (1890).

Quartet, a piece of music arranged for four solo voices or instruments, in which all the parts are *obligato*—i.e. no one can be omitted without injuring the proper effect of the composition. A mere interchange of melody, by which the parts become in turn principal and subordinate, without any interweaving of them, does not constitute a quartet. Quartets for stringed instruments are generally arranged for two violins, viola, and violoncello, and are in sonata form. They originated with Haydn, and were further developed by Mozart, and notably by Beethoven, who perfected the art of part-writing. Subsequent writers are Schubert, Spohr, Mendelssohn, Schumann, and Brahms. Vocal quartets are a frequent feature in oratorios and operas up to the time of Wagner.

Quartodecimans. See EASTER.

Quartz, a mineral composed of silica, SiO₂. It is met with chemically pure, but not infrequently contains variable proportions of ferric oxide, manganese oxides, alumina, magnesia, lime, organic matter, &c. Very often it shows inclusions, microscopic or macroscopic as the case may be, of various minerals and fluid cavities. It occurs both in crystals and massive, the more common crystals being hexagonal prisms terminated by hexagonal pyramids. Double hexagonal pyramids are also not uncommon. It scratches glass easily, and becomes positively electrical by friction—two pieces rubbed together giving light in the dark. Quartz when pure is colourless, but, owing to the presence of foreign substances, many coloured varieties are known. Three types of quartz are recognised: (1) *Rock-crystal*, (2) *Common Quartz*, and (3) *C. opac Quartz*.

Rock-crystal.—Under this head are included the varieties which are more or less transparent and assume well-marked crystalline forms. The water-clear crystals are known as *Rock-crystal*. The crystals are sometimes slender, crossing and penetrating each other in exquisite groups. They frequently enclose other substances, which are beautifully seen through the transparent rock-crystal, as slender hair-like or needle-like crystals of hornblende, asbestos, oxide of iron, rutile or oxide of titanium, oxide of manganese, &c., and such specimens are known by various fanciful names, as *Thetis' Hair-stone*, *Venus' Hair-stone*, *Venus' Pencils*, *Cupid's Net*, *Cupid's Arrows*, &c.; and sometimes the enclosed substances are small spangles of iron-glance, or crystals of iron pyrites, or native silver in fern-like leaves, or spangles of gold. Fluid inclusions are also not uncommon, as in the quartz of Poretta. Very large crystals of perfectly pure rock-crystal are sometimes found. One from the Alps, which was among the treasures carried from Italy by the French in 1797, is 3 feet in length, about 1½ feet in diameter, and weighs 7 cwt. Similar giant crystals are obtained in Madagascar. Rock-crystal was prized by the ancients, and was used by them, as it still is, for vases, cups, seals, &c. An important modern use of it is for lenses of spectacles, &c., its hardness rendering it much less liable to be scratched than glass. Lenses of rock-crystal are often called *Pebble lenses* (see SPECTACLES). Rock-crystal is best developed in the crevices and cavities of crystalline schistose and granitoid rocks, such as those of Tyrol and the Alps, where it is associated with felspar, titanite, rutile, mica, chlorite, and other crystallised minerals. *Smoky Quartz*, smoky-brown; *Cairngorm*, smoky-yellow; and *Morion*, black, are varieties whose colours have been variously

attributed to the presence of small quantities of oxide of iron or manganese, or titanio acid or organic substance. Yellow and pellucid varieties of rock-crystal are known as *False Topaz*. *Amethyst* (q.v.) or *Amethystine Quartz* is purple or violet; the darker shades are often highly prized; sometimes speckled varieties of this beautiful mineral occur. When subjected to heat amethyst loses its violet colour and becomes yellow. The *Gold Topaz* and *Citrine* of jewellers are in most cases amethysts which have been treated in this way.

Common Quartz includes non-transparent varieties, some of which, however, are more or less translucent. They are either white, colourless, or coloured, the tints being generally pale, but many show intense shades of red, green, yellow, brown, &c. Sometimes they assume crystalline forms, at other times they have a granular or massive structure. The following are varieties: *Milk-quartz*, milk-white and slightly opalescent (Greenland, &c.); *Greasy Quartz*, like milk-quartz, but with a greasy lustre; *Rose-quartz*, rose-red, sometimes crimson, the colour fading on exposure (Bohemia); *Siderite* or *Sapphire-quartz*, indigo or blue in colour, from the presence of asbestos-like fibres of blue crocidolite (Golling in Salzburg); *Ferruginous Quartz*, coloured red with ferric oxide or brown with hydrous ferric oxide; *Prase*, lock and other shades of green, which are due to needles of actinolite (Saxony, &c.); *Star-quartz*, containing within the crystal whitish or coloured eccentric radiations (Bohemia); *Fibrous Quartz*, brown, with a silky lustre, pseudomorphous after crocidolite (Griqualand West); *Quartz-pisolite* is an oolitic aggregate of quartz granules (Sicily, Egypt); *Floestone*, porous, cavernous, which floats in water until the air in its numerous cavities becomes displaced (Cornwall, &c.); *Cat's-eye*, yellow or greenish, exhibits opalescence, but without prismatic colours, an effect due to fibres of asbestos or minute tubes arranged in parallel directions (Ceylon, &c.). True *cat's-eye* is a variety of *Chrysoceryl*. *Actinurine Quartz* is a variety containing plates of mica. In reflected light, and particularly on a polished surface, these act as mirrors and give to the specimen a beautiful spangled appearance.

Compact Quartz embraces compact and also finely granular aggregates, which are only translucent on their edges. Here may be included *Jasper* (q.v.), which is really a mixture of quartz with clay and with red or yellow oxides of iron.

Allied chemically, but quite distinct in their optical characters, are the chalcodones, which consist essentially of silica in a fibrous microcrystalline condition. *Chalcodony* (q.v.) itself is colourless or pale gray, or pale bluish or yellowish, translucent to semi-opaque, and occurs either in irregular layers or in mammillary, botryoidal, or stalactitic forms. The following are coloured chalcodones: *Cornelian*, clear red and sometimes yellowish; *Plasma*, green; *Heliotrope* or *Bloodstone* (q.v.), green with red spots; *Chrysoprase*, apple-green. Flint, chert, hornstone, and touchstone are rocks rather than minerals, but are sometimes classed with the chalcodones. *Mocha-stone* or *Moss-agate* is a colourless chalcodony, containing brown moss-like dendritic inclusions. *Agate* (q.v.) consists of alternate layers of chalcodony and other varieties of crystalline and amorphous silica. *Ongar* is composed of even layers of black or brown and white chalcodony; while in *Sardonyx*, which has a similar structure, the alternate layers are red and white. For amorphous forms of silica which contain variable quantities of water, see OPAL.

Quartz is the most abundant and widely diffused of all rock-forming minerals. It is an important and characteristic ingredient of acid igneous rocks, such as granite, quartz-porphry, &c., and

forms one of the principal constituents of gneiss. In many other igneous and schistose rocks it is met with as a more or less prominent constituent. It occurs also abundantly as a secondary mineral or alteration-product in igneous and schistose rocks generally—sometimes irregularly diffused, at other times occupying cracks, crevices, cavities, &c. Many rocks, especially Archæan and Palæozoic rocks, are traversed by veins of quartz, which vary in breadth from mere lines up to many feet. In some places such veins are more or less impregnated with gold—indeed quartz-veins may be looked upon as the chief repositories of the precious metal (see GOLD).

Quartz, in crystals, is also one of the most common minerals met with lining the walls of metalliferous lodes. Amongst derivative rocks it plays an important part—conglomerates and sandstones being composed of a rille chiefly of siliceous materials. Chalcodony as a rock-constituent is a product of alteration, and is met with commonly in the vesicles and pores of many igneous rocks, or as irregular aggregates diffused through their ground-mass. It is also a common vein-mineral—the coloured chalcodones especially occurring in this form. Agates occur in veins, and especially in the amygdaloidal cavities of igneous rocks.

Quartz-porphry, an igneous rock, consisting of crystals of quartz and felspar scattered porphyritically through a compact or very finely crystalline ground-mass of the same minerals. It occurs both as an intrusive rock and in the form of lavas which have flowed out at the surface. Some of the quartz-porphries which have a very compact or microfelsitic ground-mass appear to have been originally volcanic vitreous rocks, the glass having subsequently become devitrified. The non porphyritic varieties which have a flinty or hornstone-like aspect are called *Felsite* (q.v.). 'Quartzless-porphry' is a name for Orthoclase-porphry (q.v.).

Quartz-rock, or QUARTZITE, is a commonly occurring rock, composed of an aggregate of quartz-grains welded together. It is usually white, gray, or rusty yellow or reddish in colour, and has a splintery fracture. Under the microscope the grains show a rounded and often semi-fused appearance, as if they had been mutually agglutinated while in a softened condition. The siliceous paste in which the granules are frequently set has usually a crystalline texture, and now and again crystals of quartz are developed in it. The rock not infrequently shows false-bedding, and occurs in strata of variable thickness, often forming mountain-masses. Sometimes it assumes a foliated structure (*Quartz-schist*), and contains scales of mica which occasionally form layers or laminae. The rock is obviously of sedimentary origin, and has subsequently been subjected to metamorphic action.

Quartz-trachyte. See LIPARITE.

Quasimodo Sunday. See LOW SUNDAY.

Quassia, a genus of trees and shrubs of the natural order Simarubaceæ (q.v.); having hermaphrodite flowers, with five petals combined into a tube, and much longer than the small calyx, ten stamens, five ovaries, and only one style; the fruit composed of five drupes. *Quassia amara* is a native of the tropical parts of America and of some of the West India Islands. It is a shrub 10 to 15 feet high, with racemes of bright-red flowers, and large pinnate leaves, the stalks of which are remarkably winged and jointed. The wood, and particularly that of the root, has a strong, purely bitter taste, and was at one time much used in medicine under the names of *Quassia-wood*, *Bitter-wood*, &c. The flowers were valued in Surinam for their stomachic properties as early as the beginning of the 18th century; the wood of the

root began to be known in Europe before the middle of that century, and was more fully brought into notice about 1756 by Rolander, a Swede, who had visited Surinam, and had learned its value from a negro called Quassi or Quashia.

QUASSIA: Bitterwood (*Picrocarya coccinea*), branch with bisexual flowers; a, fruit.
(Bentley and Trimen)

transferred to the Bitterwood (q.v.) of the West Indies, *Picrocarya coccinea*, a lofty tree, the wood of which possesses the same properties, although in an inferior degree; but this inferiority is compensated by the greater facility with which any requisite supply is obtained. It is the wood of this tree which is now sold as *Quassia wood*, or *Quassia chips*, in the shops. It has been used to a considerable extent instead of hops for making beer bitter, although the use of it is illegal in Britain, and beer made with it is said to become muddy and flat, and not to keep. Quassia-wood is very feebly narcotic, and a decoction of it is used for killing flies. Cabinet-work made of it is safe from all attacks of insects. In medicine it is a valuable stomachic tonic; but in fevers it is not to be compared in efficacy with cinchona and its alkaloids. Its properties depend on a bitter principle called quassin, $C_{10}H_{12}O_4$, which is present in minute amount in the wood.

Quaternary, or POST-TERTIARY, the fourth great division of the fossiliferous strata, which embraces the Pleistocene (q.v.) or Glacial and Post-glacial (q.v.) and Recent systems.

Quaternions (or 'sets of four'), the name of a calculus of peculiar power and generality invented by Sir William Rowan Hamilton (q.v.) of Dublin. As a geometry, it primarily concerns itself with the operations by which one directed quantity or Vector (q.v.) is changed into another. Such an operation is called a quaternion, for reasons which will appear hereafter. From this point of view alone we shall discuss it here. We assume the law of vector addition, which asserts

Fig. 1.

that the vector or directed line AC (see fig. 1) is equal to the sum of the vectors AB and BC—or any other directed lines parallel and equal to them. For example, the resultant of two velocities or coterminal forces is a vector equal to the vector sum of the components (see COMPOST-

TION). Quantities which do not involve the idea of direction or directedness are called *Scalars*; such are the quantities used in arithmetic and ordinary algebra. Parallel vectors can all be represented as scalar multiples of one another, or (better) of the parallel vector whose length is unity. By the latter representation, the scalar multiple gives the length or *tensor* of the vector. Thus any vector a may be factorised into its tensor and directed unit part. This is symbolised by the equation $a = TaUa$, where T and U appear as selective symbols of operation, separating out the length and direction respectively.

The operation which simply rotates a vector into a new direction without changing its length is a particular kind of quaternion called a *Versor*. A second application of this versor produces an extra equal rotation in the same plane—i.e. about the same axis. With every versor, therefore, are associated an axis having a definite direction and an angle through which any vector perpendicular to this axis is rotated by the versor operating on it.

Fig. 2.

A very important case is the quadrantal or right versor, which turns a perpendicular vector through a right angle. Let γ represent the right versor whose axis is perpendicular to the plane of the paper. Then (fig. 2) if β is any vector in the plane of the paper, the quantity $i\beta = \gamma$ gives a vector perpendicular to β and to the axis of i . A second operation gives

$$i\beta \cdot i\beta = -\beta \cdot \beta = -\beta^2,$$

or symbolically $i^2 = -1$. Thus the square of any right versor is negative unity. It is easy to show that u , where u is a scalar, is an operator which still turns any appropriate vector through a right angle, but at the same time increases its tensor u times. Such an operator is a quadrantal quaternion, whose tensor is u and versor i . A quaternion can always be factorised into its tensor and versor parts.

Now let Oi , OI (fig. 3) be the axes of two right versors i and I , making angle θ with each other. Describe the sphere of unit radius with O as centre, and draw the vector OA or a perpendicular to i and in the plane OiI . Draw OB or β perpendicular to i and a —i.e. upward from the plane of the paper; and finally draw OC or γ perpendicular to I and β . Then first $ia = \beta$ and secondly $Ia = I\beta = \gamma$; so that $Ii = (\gamma/a)$ is the versor which rotates a into the position γ . This versor has its axis parallel to OB , and its angle equal to the complement of θ . Thus any versor can be represented by the product of two right versors perpendicular to it and making with each other the appropriate angle. If the two right versors are themselves at right angles, their product becomes the right versor perpendicular to both. We thus arrive at what is historically the basis of quaternions—viz. Hamilton's remarkable system of mutually perpendicular right versors, ijk . As operators (see fig. 4) they are connected by the equations

$$\begin{aligned} ij &= k = -ji \\ jk &= i = -kj \\ ki &= j = -ik \\ jk &= -1 = i^2 = j^2 = k^2. \end{aligned}$$

The special point to notice is the non-commutative character of the process of multiplication, ij not being the same as ji . The discovery of the equation $ij = -ji$ on 16th October 1843 was

quickly followed by the development of the whole calculus of quaternions. Now, if j and k were vectors instead of right versors, the equation $ij=k$ would still be true as an equation of operations. In fact, as is capable of easy proof, right versors obey the law of vector addition; and in the identification of unit vectors and right versors, or more generally of vectors and right quaternions, lies one of the great simplifications of the calculus. Thus the operator $(i+j)$ is a right quaternion whose axis (see fig. 4) is along the

Fig. 3.

diagonal of the square of which i and j are the sides, and whose tensor is equal to the length of this diagonal.

The following conclusions are readily come to. The square of every unit vector is negative unity; the product of two parallel vectors is *minus* the product of their tensors; the product of two perpendicular vectors is a third vector perpendicular to both and having its tensor equal to the product of the tensors of its factors; the product of any two unit vectors is in general a versor; the product of any two vectors is a quaternion whose tensor is the product of the tensors, and whose versor is as mentioned in the preceding sentence. The quaternion $a\beta$ transforms β^{-1} into the vector a ; and β^{-1} , being itself that quaternion which undoes the effect of the right quaternion β , must also be a right quaternion—i.e. a vector. In fact, β^{-1} is always equal to a scalar multiple of $-\beta$. Hence the quaternion $a\beta$ is the operator which changes the vector β^{-1} into the vector a . This operation involves *four* numbers: first, the change of length; second, the angle through which the one vector must be rotated so as to bring it into parallelism with the other; and third and fourth, the two numbers necessary to fix the *aspect* of the plane in which the rotation takes place, or the direction of the axis about which rotation takes place. Thus a quaternion, in general, depends on *four* numbers, whence the name. A vector or quadrantal quaternion is a degenerate quaternion, involving only *three* numbers; while a scalar, which might be defined as the quaternion which changes one vector into a parallel one, is still more degenerate, involving only *one* number—viz. itself.

There is still one very important representation of a quaternion to consider. This is done most simply as follows: Let $a\beta$ be the two vectors OA, OB (fig. 5). Resolving β along and perpendicular to a we get $\beta = OM + ON$; and hence $a\beta = OA.OM + OA.ON$. But OA.OM, being the product of two parallel vectors, is *minus* the product of the lengths or tensors. On the

Fig. 5.

other hand, the product OA.ON, being the product of two perpendicular vectors, is a vector perpen-

dicular to the plane of the paper with tensor equal to twice the area of the triangle OAB. Thus the quaternion $a\beta$ is equal to the sum of a scalar and a vector; and generally for any quaternion (q) we have the relation

$$q = S.q + V.q,$$

where S selects the scalar part and V the vector part. The geometrical meanings of S and V operating on $a\beta$ are easily seen to be these—

$$S.a\beta = -TaT\beta \cos \theta, \quad V.a\beta = iTaT\beta \sin \theta,$$

where i is the unit vector perpendicular to a and β .

We end with a few illustrations. Thus, if a is a constant vector, and ρ a variable vector, the equation $S.a\rho = r$, a constant, means that the resolved part of ρ along the direction of a is constant, and that therefore the extremity of ρ traces out a plane perpendicular to a . The versor that turns any line through an angle θ in a given plane has the form $\cos \theta + i \sin \theta$, where i is the right versor perpendicular to that plane. DEMAILRE's theorem (see DEMAILRE) at once follows if we write $i = \sqrt{-1}$. Finally, if β represents a force acting at the extremity of a , $V.a\beta$ is the vector moment of the force about the origin; and in the almost self-evident equation

$$V.a(\beta + \beta^1) = V.a\beta + V.a\beta^1$$

we have a completely general demonstration of Varignon's theorem of moments. See MOMENT.

Hamilton's *Lectures on Quaternions* (1853) and his *Elements of Quaternions* (1866) are still the classical works on the subject. Tait's *Elements of Quaternions* (3d ed. 1890) is probably better fitted as a text-book for the student to work through, and contains some original applications of high physical interest. Kelland and Tait's *Introduction to Quaternions* (1874) may be recommended to the beginner. Tait's treatise has been translated into French and German.

Quatre-Bras, a village of Belgium, about 10 miles SSE. of Waterloo, situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name ('four arms'). On 16th June 1815, two days before the battle of Waterloo (q.v.), Quatre-Bras was the scene of a desperate battle between the English under Wellington and the French under Ney. The honours of the field remained with the former; but the severe defeat of Blücher the same day at Ligny compelled Wellington to retreat. The loss on the English side was 5200, on the French 4140, amongst the Allies being the Duke of Brunswick, the gallant chief of the Black Brunswickers. A monument to his memory, a bronze lion 10½ feet high, was erected in 1890.

Quatrefages de Bréau, JEAN LOUIS ARMAND DE, French naturalist, was born at Berthezène (Gard) on 10th February 1810, studied medicine at Strasbourg, and in 1838 was appointed professor of Zoology at Toulouse. But this post he soon resigned and went to Paris to study further for himself. In 1850 he was elected professor of Natural History in the *Lycée Napoléon*, and in 1855 of Anatomy and Ethnology at the Natural History Museum in Paris. He devoted his attention principally to anthropology and the lower animals, especially annelids. His chief works are *L'Espère Humaine* (1877; 8th ed. 1886; Eng. trans. 1879); *Souvenirs d'un Naturaliste* (1864; Eng. trans. 1857); *Unité de l'Espère Humaine* (1861); *Crania Ethnica* (1872-82); *La Race Prussienne* (1871; Eng. trans. 1872); *Les Pygmées* (1887); *Histoire Naturelle des Annelés* (2 vols. 1865); *Darwin et ses Précurseurs Français* (1870); and *Théories Transformatives* (1892). He died 12th January 1892.

Quatrefoil, an opening in tracery, a panel, &c., divided by cusps or featherings into four leaves. This form is much used as an ornament in Gothic architecture.

Quatrefoil.

Quattro Cento (Ital., 'four hundred,' a contraction for one thousand four hundred; cf. *CINQUE CENTO*), in Italian a term for the 15th century, its literature and art; the early Renaissance. Outstanding *Quattrocentisti* in art are Donatello, Della Robbia, Brunellesco, Masaccio, Ghirlandajo, Lippo Lippi, and Mantegna.

Quebec, a province of Canada, has an area of 706,834 square miles, 15,969 square miles of which is water. It is bounded on the north-east by the Newfoundland dependency of Labrador; on the south by the United States and the Canadian provinces of Ontario and New Brunswick; on the west by Ontario and Hudson Bay. The surface of the northerly portion or uplands comprises a part of the Laurentian plateau, most of which is unexplored. This portion is exposed to summer frosts, but is rich in mineral promise. The lower lying portion along the lower St. Lawrence is in many places rugged and rocky, and along the shores are situated many fishing hamlets. The main agricultural area is in the eastern townships, south of the St. Lawrence, between Quebec and Montreal, but along the north shore between the same cities there is a fine agricultural district. Quebec possesses many great rivers, the principal being the St. Lawrence, which flows out of Lake Ontario and into the Atlantic, a distance of over 1000 miles; the St. Lawrence is tidal as far as Three Rivers, a town between Quebec and Montreal, the spring tide rising to 18 feet, and the river is navigable for ocean steamers as far as Montreal, and for other vessels 1220 miles farther inland in Ontario to Fort William on Lake Superior, to which place a channel of 14 feet depth has been provided. The Saultages Canal, 14 miles, and the Lacine Canal, $8\frac{1}{2}$ miles long, are a part of the waterway in the province of Quebec. The main tributary of the St. Lawrence is the Ottawa, about 600 miles in length, and dividing Quebec from Ontario. Other large rivers are the Nottaway, Rupert, East Main, Big, Great Whale, Leaf, Koksoak (with Kuipapiskau), George, and Hamilton (or Grand). The principal islands belonging to the province are Anticosti, at the mouth of the St. Lawrence, 140 miles long and 30 miles wide, with an area of 2600 square miles; and the Magdalen islands, lying south of Anticosti; the leading occupation on these islands is fishing; the catch consists chiefly of mackerel, cod, and halibut. The islands off the north and west coasts belong not to Quebec but to the North-west Territories.

Agriculture is the principal pursuit of the people of the province. Dairy produce takes the first place. Other products are oats, barley, wheat, Indian corn, hay, rye, buckwheat, flax, pulse, potatoes, turnips, carrots, celery, beets, pursnips, melons, plums, apples, and small fruits. The apples of the Montreal district and the eastern townships have a high reputation. Tobacco and maple sugar are also produced to a large extent, and the breeding of horses, swine, cattle, sheep, and poultry has attained great proportions. The province is notably rich in minerals; alluvial gold is found in various places; copper is found in the eastern townships; while iron is very generally distributed. Other minerals, such as lead, silver, platinum, and zinc are also found, while the asbestos and apatite deposits have achieved a reputation far beyond the limits of the province.

Lumbering is carried on extensively, and the many large rivers form an excellent medium for transporting the immense quantities cut in the forests of the interior. The forests are estimated to cover over 200,000 square miles. The principal manufactures are those connected with cloth, linen, furniture, leather, sawn timber, flax, iron and hardware, paper, chemicals, sugar, soap, india-rubber goods, boots and shoes, cotton and woolen goods, cheese, and all kinds of agricultural implements. There are numerous falls and rapids on the rivers and streams (especially the Hamilton River) capable of furnishing an immense supply of power. The total development to date is well over a million horse power.

The affairs of the province are administered by a lieutenant-governor, who is appointed by the governor-general, an executive council consisting of 24 members appointed for life, and a legislative assembly of 86 persons elected every five years. Women are not enfranchised and are not eligible. The province is represented in the Dominion Senate by 24 members, and in the House of Commons by 65 members. Quebec's representation in the Federal House of Commons was arbitrarily fixed at the time of confederation at a minimum of 65, the representation of the other provinces being made proportionate thereto. The population, one-fifth of whom are French, in 1881 was 1,359,027; in 1891, 1,488,535; in 1901, 1,648,898; in 1911 (including the districts added in 1912), 2,005,776; and in 1921, 2,361,199. In religion the Roman Catholics comprise about nine-tenths of the population. Education is under the supervision of a council, which is divided into two committees for the government of Roman Catholic and Protestant schools respectively. The two Protestant universities are McGill, at Montreal, and Bishop's College, at Lennoxville. Laval, at Quebec, and Montreal, a separate university since 1920, are Catholic. The principal city in the province is Montreal, which now claims a population of over 618,000, and is the commercial metropolis of the Dominion. The next is Quebec, the most historic city in Canada, and the seat of the provincial government.

From a historical point of view the province of Quebec is probably the most interesting part of the continent, and has already been dealt with up to the 'Quebec Act' of 1774 in the article Canada (q.v.). The French language is still used in the province, and is sanctioned by law; the same remark applies to the French law. It is generally supposed that these privileges were conferred upon the French-Canadians by statute, but this is not the case. By the proclamation of 1763 French law was abolished in the province, and the English law substituted for it. The civil law of France was established again in 1791, and the use of the French language was officially recognised for the first time in that year; but by the Act of 1840 the French language was again set aside, and it was only legalised again in 1848. The principal historical occurrences in the 19th century were the rebellion of 1837-38, which led to the union of Upper and Lower Canada in 1840, and the subsequent difficulties which ended in confederation (1867) with the other provinces of Canada. In 1912 the area of Quebec was greatly increased, with little addition to its population, by the inclusion of Ungava, bringing the province to include the whole of the Labrador peninsula except the north-east coast, belonging to Newfoundland. The settlement of the boundary with Newfoundland has been referred to the Privy Council.

See *Quebec Past and Present*, by J. M. Lemoine (Montreal, 1876); *Picturisque Quebec* (1881); Garnett's *History of Canada*; Sulte's *Histoire des Canadiens*

Français; Cassell's Picturesque Canada: M. Meroier's sketch of the Province (1890); The Siege of Quebec (6 vols. Quebec, 1903); Old Quebec, by Sir G. Parker and others (1903); Sutherland's Province of Quebec (1922); and books named at CANADA.

Quebec, capital of the province of that name, is situated on a steep promontory on the north-west bank of the St Lawrence at its junction with St Charles River, 300 miles from the Gulf of St Lawrence and 180 miles below Montreal (172 by rail). The highest part of the headland is Cape Diamond, 333 feet above the level of the river. Quebec is the most important military position in Canada. The citadel occupies an area of 40 acres, and commands a magnificent view. The harbour is spacious, and the docks and tidal basin are perfect specimens of engineering skill. On the Lévis side of the river is the extensive graving dock. The city is divided into an Upper and a Lower Town. In the latter are situated the banks, warehouses, and wholesale and retail stores. In the Upper Town are the principal residences, public buildings, churches, gardens, and retail shops. Towards the west are the thriving suburbs of St John, St Louis, and St Roch. The addition of St Malo and Limoilou wards doubled the city territory. St Roch and Jacques Cartier have immense warehouses and stores. To the south-west of St John are the Plains of Abraham, the historic battlefield, with a column to the memory of General Wolfe. Another monument (65 feet) to Wolfe and Montcalm overlooks the St Lawrence. In 1908 the Plains of Abraham, a scene of the historic battle, were set apart as a National Park and a monument erected. On the Ste Foye road is an iron pillar crowned by a bronze statue, commemorating the deeds of the British and French under Murray and Lévis in 1760. There is a shaft also to the memory of Cartier and the Jesuit Brébeuf. In 1898 a statue to Champlain (q.v.), founder of the city, was unveiled. In the Upper Town is Dufferin Terrace, 1400 feet long, commanding a noble view. The Grand Battery is also picturesquely situated. Three handsome modern gates have replaced the old gates. The principal edifices are the parliamentary and departmental buildings, court-house, post-office, custom-house, city hall, masonic hall, basilica, the archiepiscopal palace, the Anglican Cathedral, Church Hall, and Young Men's Christian Association building. Laval University, named after the first Roman Catholic bishop of Quebec, who in 1663 founded the seminary, holds two charters, one from Queen Victoria (1852) and the other from Pope Pius IX. The building is well equipped with library, museum and art gallery, laboratory, &c. The Quebec seminary is the oldest institute of superior education in America, older than Harvard. At the Grand Seminary theology is taught; the minor seminary is devoted to literature and philosophy. Other Roman Catholic halls of instruction are Laval Normal School, the Ursuline Convent, the Convent of the Good Shepherd, and several nunneries. The supply of water is continuous and good, and comes from Lake St Charles. The city is lighted by electric power from the Falls of Montmorency, 9 miles distant. The Canadian National Railway crosses the St Lawrence above the city, and an immense bridge was open for traffic in 1917. See **BURDGE**.

Quebec trades in grain, lumber, pulp, and beef. The principal manufactures are worsted goods, iron-castings, machinery, cartridges, cutlery, nails, leather, musical instruments, boots and shoes, paper, tobacco, and steel. The city has repeatedly suffered from disastrous fires. It is the seat of a Roman Catholic archbishop and an Anglican bishop. It was originally called *Stadaconé*, and

was visited by Cartier in 1535. In July 1608 Champlain founded the town and gave it its present name. It continued to be the centre of French trade and civilisation, as well as of the Roman Catholic missions in North America, till 1759, when it fell into the hands of the British (see **WOLFE**). In 1763 it was ceded to Great Britain by the treaty of Paris. Pop. (1852) 42,052; (1901) 68,840; (1911) 78,190; (1921) 95,193. The old walled city and its historical monuments and memories make the city a place of pilgrimage for tourists from all countries.

Quebracho ('axe breaker'), a name given to several trees with very hard and heavy wood. *White Quebracho* (*Aspidosperma Quebracho*; family Apocynaceae) grows in swampy forests of Argentina and Paraguay. Its timber is valuable for railway sleepers and many other purposes involving exposure to the weather; but it is exploited (very crudely and wastefully) for the sake of its heartwood, which yields the purest and quickest of all tanning extracts. This tree yields another extract, *Aspidospermine*, which acts like quinine—lowers the temperature in some cases of fever, promotes secretion from the kidneys, intestinal and salivary glands, and relieves dyspnoea or asthma of functional origin. *Red Quebracho*, also used for tanning, comes from the South American genus *Schinopsis* (*Aucardiaceae*), especially *S. Lorentzii* and *S. Balanense*.

Qedah, or **KEDAH**, a state on the west side of the Malay Peninsula, with an area of 3800 sq. m. and a pop. of 339,000, of whom two-thirds are Malays. Siam ceded the greater part to Britain in 1909. The capital is Alor Star. See **MALAY STATES**.

Quedlinburg, a town of Prussia, at the northern base of the Harz Mountains, 56 miles by rail S.E. of Brunswick. Founded by Henry the Fowler in 924, it is still in part surrounded by a wall flanked with towers. On an eminence overlooking the town stands the castle, which prior to the Reformation was the residence of the abbesses of Quedlinburg, who were independent princesses of the empire, and had a vote in the diet and other privileges. The castle chapel contains monumental tombs of Henry I., his wife Matilda, and the Countess of Königsmark. Here Klopstock and Karl Ritter were born. Pop. 27,000.

Queen (O.E. *cwen*, 'a woman,' cognate with Dutch *queen*, Ice. *krón*, Gr. *gyné*, Sansk. *jñan*), in its primary signification, the king's consort, who has in all countries been invested with privileges not belonging to other married women. The Statute of Treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the queen consenting is herself guilty of treason. If accused of treason, the queen is tried by the peers of the realm. The queen-consort is exempt from paying toll, and from amercements in any court. She has a Household (q.v.) of her own. It has been the usual practice to crown the queen-consort with solemnities similar to those used in the coronation of the king. In the case of Queen Caroline, consort of George IV., who was living apart from her husband, this was not done. Certain rents or revenues were anciently appropriated to the income of the queen, but no separate revenues seem ever to have been settled on any queen-consort by parliament. Her personal expenses are defrayed from the king's privy purse.

The queen-dowager is the widow of the deceased king. She retains most of the privileges which she enjoyed as queen-consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the queen-dowager without permission from the king, on pain of forfeiture of

lands and goods. On the marriage of a king, or accession of an unmarried prince, parliament makes provision for the queen's maintenance in case of her survival.

The queen-regnant is a sovereign princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of males a female succeeds to the throne. By an act of Queen Mary, the first queen regnant in England, it was declared 'that the regal power of this realm is in the queen's majesty as fully and absolutely as ever it was in any of her most noble progenitors kings of this realm; and it has since been held that the powers, prerogatives, and dignities of the queen-regnant differ in no respect from those of the king. The husband of the queen-regnant is her subject; but in the matter of conjugal infidelity he is not subjected to the same penal restrictions as the queen-consort. He is not endowed by the constitution with any political rights or privileges, and his honours and precedence must be derived from the queen.

Queen Anne Style. See RENAISSANCE.

Queen Anne's Bounty, the name given to a fund appropriated to increase the incomes of the poorer clergy of England, created out of the first-fruits and tithes, which before the Reformation formed part of the papal exactions from the clergy. The first fruits are the first whole year's profit of all spiritual preferments, and the tithes are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice; but more than half of the livings are now exempted from the tax. Henry VIII., on renouncing the papal authority, annexed both first-fruits and tithes to the crown, and, by an act passed in 1703, these revenues were set aside, with the consent of Queen Anne, to form a perpetual fund for the augmentation of poor livings. To 'The Governors of the Bounty of Queen Anne, for the augmentation of the Maintenance of the Poor Clergy,' was granted the revenue of first-fruits and tithes. The application of the funds at the disposal of governors is now made subject to a long series of statutory provisions. Until 1919 the greater part of governors' grants consisted of capital sums to meet benefactions of money, lands, tithes, rent-charges, stipends, &c., of equal value, offered on behalf of benefices not exceeding £200 in net annual income. Since that date the funds have been devoted mainly to the relief of dilapidation assessments on benefices not exceeding £250 per annum, also to loans for building, &c. The governors have also the administration of moneys in respect of sales of parsonages, globes, and title redemption. See annual report.

Queen Anne's Farthings. See FARTHING.

Queenborough, a municipal borough on the Isle of Sheppey, Kent, 2 miles S. of Sheerness, was founded by Edward III. (1369), and named after Queen Philippa. There were daily sailings between Queenborough and Flushing before the Great War. Pop. 3000.

Queen Charlotte Islands, a group to the north of Vancouver Island, off the coast of British Columbia. They number about 150 in all. The two principal islands, Graham and Moresby, have a length of 160 and a greatest breadth of nearly 70 miles. The climate is healthy, but very rainy. Anthracite coal, copper and iron ore, and gold-bearing quartz have been found, and forests abound. Halibut fishing is very important. For the Indians (Haidas), see C. Harrison, *Ancient Warriors of the North Pacific* (1925).—*Queen Charlotte Sound* is a strait separating Vancouver Island, on the north, from the mainland.

Queen of the Meadow. See SPIRÆA.

Queens, a 'borough' of New York City (q.v.).

Queensberry, WILLIAM DOUGLAS, DUKE OF, 'Old Q.' was born in 1724, and succeeded his father as Earl of March, his mother as Earl of Ruglen, and his cousin in 1778 as fourth Duke of Queensberry. He was famous for years as a patron of the turf, and infamous always for his shameless debaucheries. He is said to have 'displayed great taste in a song,' but to-day lives solely through Wordsworth's indignant sonnet, composed at Neidpath, whose venerable trees 'degenerate Douglas' had felled, to spite his heir or to dower one who he flattered himself was his daughter. After long fear of death he died unmarried, worth over a million sterling, on 23d December 1810, and was buried beneath the communion table of St James's Church, Piccadilly. See Life by J. R. Robinson (1895).

Queensberry Plot. See LOVAT.

Queen's College, for women (43 and 45 Harley Street, London), was established in 1848, and incorporated by royal charter in 1853. It owed its existence partly to the Governesses' Benevolent Institution and partly to a movement originated by the Rev. C. G. Nicolay, and supported by the Rev. F. D. Maurice and other King's College professors. Its Committee of Education as at first constituted included the names of Maurice, Trench, and Kingsley; of Stendrale Bennett and Hullah; of Ansted and Edward Forbes; of Mulheady and Richmond.

For other Queen's Colleges, see IRELAND, CAMBRIDGE, OXFORD.

Queen's Counsel. See KING'S COUNSEL.

Queen's County, an inland county of Leinster, Ireland, is bounded N. by King's County, S. by Kilkenny, and W. by Tipperary, and measures 33 miles by 37 in its extreme dimensions. Area, 424,854 acres; pop. (1841) 153,988; (1861) 90,650; (1881) 73,124; (1891) 64,639; (1911) 54,629 (88.7 per cent. Catholics). Queen's County is, for the most part, within the basin of the Barrow, and is flat and, except where bogs prevail, fertile. It is drained by the Nore and crossed by the Grand Canal. On the north-western border lie the Slieve Bloom Mountains, reaching 1734 feet. Coal occurs in the south-east. Agriculture is the principal occupation, oats, barley, potatoes, and turnips being the principal crops; there is much dairy-farming, and a little woollen and cotton weaving. This district was made a shire in honour of Queen Mary, from whom also the chief town, Maryborough (pop. 3300), was called. The antiquities include a round tower and some ecclesiastical and feudal remains, the most important being a castle on the picturesque rock of Dunamase.

Queensferry, a town of Linlithgowshire, 9 miles WNW. of Edinburgh, on the south shore of the Firth of Forth, which here is crossed by the great Forth Bridge (1882-90); see BRIDGE. Named after St Margaret (q.v.), it has been a burgh of royalty since 1363, a royal burgh since about 1639, and a police burgh since 1882; with Stirling, &c., it returned one member till 1918. Remains of a Carmelite friary were converted in 1890 into an Episcopal church; and one of its hotels is the Hawes Inn of Scott's *Antiquary* and Stevenson's *Kidnapped*. Close by are the seats of the Earl of Rosebery and Marquis of Linlithgow. Pop. 2200.

Queensland, a State of the Australian Commonwealth, occupies the north-eastern regions of the island continent. On the east it is bounded by the Pacific Ocean, here known as the Coral Sea; on the north by Torres Straits and the Gulf of Carpentaria; on the west by the line of long.

138° E., separating it from the Northern Territory, and lines along lat. 26° S. and long. 141° E., separating it from South Australia; and on the south by the line of lat. 29° S. to the Dumaresq River, thence along that river upwards and along the Dividing and Macpherson Ranges to Point Danger on the coast, in lat. 28° 8' S. The area of the State is 670,500 sq. m., rather less than a quarter of the whole area of the Commonwealth.

The districts now included in Queensland were originally discovered by two separate routes. Cook and Flinders both passed along the coast, but Oxley, surveyor-general under Governors Macquarie and Brisbane, was the first to explore it for purposes of settlement in 1823; he was looking for a site for a penal station, and was induced by two castaway timber-getters to penetrate the recesses of Moreton Bay and sail up the river which he afterwards named the Brisbane. In 1827 Allan Cunningham made his way behind the Dividing Range north across the Nainoi to the Darling Downs, and squatters looking for pasturage followed in his tracks; so that, although Cunningham himself in 1828 discovered a pass connecting the downland with the Brisbane valley, the penal (afterwards largely agricultural) settlement on the coast had for many years little intercourse with the inland pastoral stations, which communicated direct with Sydney along the tracks by which they had been opened up. This division in many ways seriously affected the colony's subsequent history. The pastoralists had no objection to convict labour, and welcomed it when in 1849 Sydney and Melbourne had refused to let convicts land; while the original penal settlement at Brisbane, transformed into a prosperous farming area by the efforts of Dr Lang, resented the reintroduction of the convict element. And when in 1859 the two districts were cut off from New South Wales and constituted an independent colony, the wish of the Imperial Government to retain the northern half was frustrated by the fears of the Brisbane settlers and their friends further south that the retained portion would be again used to receive transportees. Consequently the colony has been unwisely from the first, a mixture of temperate and tropical coastlands and dry inland areas all ruled from a seaport capital in the far south-eastern corner; and its history has been full of movements for further subdivision, Rockhampton in the centre and Townsville in the north being aspirants for the leadership of new States to-day. For the State's further history and the work of the explorers Mitchell and Leichhardt, see AUSTRALIA.

Geography.—The main Dividing Range, with its foothills merging into the great central plain, accounts for the whole of Queensland as of New South Wales. But its resemblance to a genuine mountain-range is even smaller than in the southern State. It is merely a watershed meandering across a much-dissected tableland, at first not far from the coast, then passing 200 miles and more inland, then bearing east again about lat. 17° and almost hugging the eastern shores up to Cape York. Behind Brisbane some of its peaks exceed 3000 feet, but nowhere else does it reach that height; the highest hills in the State are Mount Bartle Frere (5438 feet) in a coastal range near Cairns, and Mount Barney (4300 feet) in an eastern spur on the southern border. As a result of this the coastal rivers of Queensland are far more important than any further south. While the Hunter, the most important river of New South Wales, is 340 miles long, and drains about 11,000 sq. m., the Burdekin in Queensland is 440 miles long, the Fitzroy (to the head of the Dawson) nearly 500, and each drains about 55,000 sq. m. Other important coastal rivers are the Brisbane (200), Mary (165), and Burnett

(250, draining an area exceptionally large for its length), south of the Fitzroy basin, and the Herbert (150) and Normanby (162) north of the Burdekin basin. West of the Great Divide the tableland slopes away in 'downs,' of which the Darling Downs are the best known, to the central plain. This is divided by two long, low ridges—the Grey Range and the Kirby-Selwyn Ranges—into three basins; the Moonie (215), Condamine-Balonne (495 in Queensland), Warrego (365 in Queensland), and Bulloo (370) flow into or towards the Darling; the Thomson (240) and Barcoo or Victoria (310), joining to form Cooper's Creek, flow under that name nearly 600 miles farther into Lake Eyre, which also occasionally receives the outflow of the Diamantina (743, of which 468 in Queensland); while the Leichhardt (300), Flinders (520), Gilbert (312), and Mitchell (350), with numerous smaller streams, drain into the Gulf of Carpentaria. It must be remembered that practically all the rivers of the first two basins—the Condamine is the only important exception—are permanent only in their upper courses, and dwindle sadly as they approach the plains. To prevent confusion, it should also be noted that some authorities use the term 'Great Divide' to denote the low watershed between the Lake Eyre and the Gulf basins; in this account the official Australian nomenclature is adopted.

The population of the State averages little more than one person to the square mile, but over the greater part of the area there is not one to 4 square miles. Still, Brisbane is the only State capital on the continent which contains less than a third of its State's population, its actual share (230,000) being little more than a quarter; the other chief centres of population are Maryborough (11,000), Rockhampton (25,000), and Townsville (21,000) on the coast, Ipswich (20,000) in the Brisbane valley, and Toowoomba (21,000) on the Darling Downs. Among the smaller towns are Gympie (6500) and Charters Towers (9500) on gold-fields east of the watershed; Mount Morgan (7200) near Rockhampton which during 1921 was temporarily deserted owing to strikes at the big mine, but with the collapse of the strike and the increase in the price of copper was gradually repopulated; and the prosperous little seaports, backed by large areas planted with sugar-cane, of Bundaberg (9000), Mackay (6000), and Cairns (7500). South of Maryborough the coastal districts are mainly agricultural; northwards lie long stretches of pastoral hill-country, broken with patches of rich sugar-land near the ports already named, and at Bowen, Ayr, Cardwell, and Innisfail between Mackay and Cairns. On the range west and south west of Cairns is one of the richest and most varied mineral districts in Australia. The basins of the Fitzroy, Burdekin, and the Gulf rivers are the great cattle regions; sheep are better suited by the low inland downs on the upper waters of the Barcoo, Thomson, and Diamantina. In the north west corner, where the great western tableland of Australia intrudes on the plains, a district known as the Barkly Tableland—cattle again prevail over sheep.

Geology.—Post-Tertiary deposits are represented in this State by the coastal alluvia of the Gulf of Carpentaria and by a few bone-drifts. Of Tertiary age hardly anything remains except some outflows of basalt covering patchy areas of the tableland from the Burdekin valley northwards. Cretaceous deposits are of great importance. The Lower Cretaceous marine clays, dating from a time when the Gulf of Carpentaria extended south to the Darling on one side and to Lake Eyre on the other, cover more than half the State; they are known as the 'Rolling Downs' formation, and mark the artesian

area; a very porous bed of sandstone—known as the Blythesdale Braystones—outcropping along the western edge of the tableland, intercepts the flow of large rivers, and conducts it beneath the Cretaceous clays, from which artesian bores release it. It is probable that at one time the whole of the Lower formation was covered by sheets of Upper Cretaceous sandstones and shales, known as the Desert Sandstones; extensive denudation has reduced these to isolated patches occurring (a) over the Cape York Peninsula; (b) along the western edge of the tableland from Hughenden south to the New South Wales border; (c) in ridges and plateaux on the great plain. Trias-Jura deposits, including coal-seams of more or less value, are found in the coastal districts; one patch—the Burrium beds—covers about 100 miles of coastline each side of Maryborough, the other—the Ipswich formation—occupies 12,000 sq. m. round and behind Brisbane, and occurs also behind Gladstone, where it contains at least one seam of sound coal 30 feet thick. But the bulk of the tableland south of lat. 20° is of Permian-Carboniferous age; the chief formations are the Gympie beds, in which most of the principal gold-fields occur, and the Middle and Upper Bowen beds, extending in a broad belt from near Townsville south-east and south to the Dawson River, which include valuable seams of anthracite coal on the Dawson and near Clermont. There is a second Permian-Carboniferous area behind Cairns and Cooktown, the direct connection being broken by the great block of metamorphic rocks (Archean according to Professor Gregory, Silurian in the opinion of most local geologists) which crosses the foot of the Cape York Peninsula from the Gilbert to Charters Towers. In this occur mineral deposits of a very varied nature, and gold, copper, silver-lead, tin, wolfram, molybdenite, and bismuth are mined advantageously. The same rocks, jutting out into the western part of the State from the great western Australian tableland, account for the rich mineral fields of the Cloncurry district, where, in addition to those already mentioned, monstone of high quality is also found. The only other series of deposits worth special note is a Devonian limestone formation, best known where it bestrides the Great Divide from the upper Burdekin to the upper Gilbert.

Industries.—The principal industries of the State have been already referred to. It is still essentially pastoral, containing nearly half the cattle and nearly a quarter of the sheep of the Commonwealth, and about 30 per cent. of the horses. Its agriculture, though rapidly growing, is insignificant in comparison with that of the southern States; its dairying also grows rapidly, especially on the hills behind Brisbane, and a condensed milk industry has developed considerably of late years. But its chief agricultural product is sugar, which occupies nearly a quarter of the lands under crop, against 17 per cent. under maize and 20½ under wheat. In 1923-24 about 41,000 acres under cotton were harvested, giving a yield of 12½ million lb. unginned, and this new industry is rapidly extending its bounds. During the war the Federal Government took control of the sugar output, and in 1916 fixed the wholesale price at £29, 5s. per ton; in 1920 this was raised to £30, 6s. 8d.; but in 1923 direct government control ceased, and it was agreed that for the next two years the price should not rise above £27 per ton. This agreement, coupled with an embargo on the importation of foreign sugar, has been prolonged until 1st September 1928; afterwards the industry will be protected like any other by means of the customs tariff. The manufactures of the State are also for the present of minor importance, the value of their output being only 11 per cent. of the total values

for the Commonwealth. In mining, on the other hand, though its total output is only a third of that of New South Wales, and is exceeded by that of Western Australia, Queensland excels the other States and approaches New South Wales in the variety of its resources. It produces more than half the copper and molybdenite of Australia, and more than 30 per cent. of the wolfram; and its hitherto small production of coal and iron, as well as of the minerals previously mentioned and several others, is due entirely to the difficulties of transport over the great inland distances or the steep coastal ranges.

In 1923 about 5½ per cent. of the State's area was alienated or in process of alienation; the proportion has been steadily decreasing since 1915, which shows that more land has been abandoned—partly, no doubt, because the young settlers enlisted and were killed—than has been taken up. Pastoralists and a few others held under lease or license 71·7 per cent.

Trade.—Direct exports from the State have nearly doubled in value since 1915. Wool, though still the chief staple of export, and worth more per lb. than that of any other State, has fallen off very greatly in quantity since 1915; it is almost entirely merino. The meat export is mainly beef, over a million pounds' worth of which was sent away in 1923-24; butter accounted for nearly £3,000,000.

Government.—The State government is of the usual type (see AUSTRALIA), except that the Legislative Council was abolished in 1922. The Legislative Assembly has 72 members, representing single-member constituencies, with a modified system of optional preferential voting; they are paid £500 a year. A unique provision allows members to vote by proxy, so that the rule of the majority in the legislature is not impeded by the absence or sickness of any of its members. Ten ministers administer as many departments. The State revenue, which between 1915 and 1924 ran up from 7½ to 13½ millions, showed a slight credit balance in the latter year. Nearly half the revenue, however, is derived from the State railways, and is more than accounted for by their working expenses and interest on the capital invested—during the five years 1920-24 the yearly loss averaged £2,330,000, or 3 per cent. on the capital cost; their percentage of net revenue to capital expenditure is the lowest in any State, except Tasmania, averaging little more than 1. Apart from railways, the State revenue is mainly derived from taxation (£4, 9s. 2d. per head of population, the highest in Australia), land-sales and rents (also the highest per head), and the Federal subsidy of about £1,000,000; the expenditure includes over 14 millions for education. Of the total loan expenditure of about 70 millions, two-thirds has been invested in railways and tramways. Owing to flotation and other expenses, the actual public debt considerably exceeds the amount expended; on 30th June 1924 it amounted to 90½ millions—£109, 8s. 9d. per head of population—at an average interest rate of £4, 8s. 10d. per cent.; nearly 70 per cent. of the money was borrowed in England. The sinking fund is negligible, about £940,000.

The State railways had, on 30th June 1924, a mileage of 6040—the largest in Australia—open for traffic, with another 441 miles under construction, and 1166 more authorised. Practically the whole State system is of 3 ft. 6 in. gauge. When the planned system is complete, it will include a coastal railway from Tweed Heads to Cairns, a far western line from Eromanga to Camooweal, and three or four cross-country lines connecting the two, with numerous cocks spur branches and separate inland extensions from Cooktown, Cairns, and Normanton. Connection with the rest of Australia will be afforded by lines through Kyogle and Tweed

Heads with the New South Wales coastal lines, and by branches running south-west from Brisbane with various inland lines of the same State, while an extension from Camoowien into the Northern Territory is also projected. Private railway lines had a mileage of 1300.

Population, Education, &c.—The population between 1901 and 1924 increased from 493,847 to 834,894; about 53 per cent. are males. About three-quarters of the population was born in Australia, and another fifth in the United Kingdom.

Queensland's primary educational system is of the usual Australian type (see EDUCATION); but, owing to the sparseness of the population, provision is made for average attendances as small as twelve. Isolated families are dealt with by itinerant teachers, or by 'correspondence tuition.' Authorised ministers of religion are permitted to give religious instruction during school hours, and Scripture lessons are included in the regular curriculum. Private schools may, under arrangement with the department of education, be inspected by State school inspectors, and advantage is frequently taken of this privilege. Up to 1912 secondary education was carried on mainly in subsidised grammar schools governed by trustees, of whom the government appoints a majority. Of these schools there were ten, established in the ten principal towns of the State, and State school pupils were admitted by means of scholarships. These schools and arrangements still exist, but in 1912 six State high schools were established, and five more have since been added; nine primary schools in important country centres have also been provided with secondary departments. All these schools, State and private, are connected with the university of Queensland by a scheme which provides twenty three-year scholarships. A teachers' training college at Brisbane is in operation, entry being obtained by gaining a certificate at the 'junior' or 'senior' public examination. Technical education is provided for by seventeen colleges with sixty-three branches, including central schools, do schools, prep

tory trade schools, and classes for apprentices. In certain trades the attendance of young workers at these classes is made compulsory by industrial awards. At Gatton, 60 miles W. of Brisbane, there are a State agricultural college and high school, and at Nambour, Boonah, Marburg, Guncwille, and Home Hill there are rural schools providing vocational education. In many centres special instruction is given to backward, subnormal, and defective children. The university of Queensland was founded in 1909, and commenced its work in three faculties (arts, science, and engineering) in 1911. In 1923 11 professors and 16 lecturers taught 387 undergraduates. Its activities include evening lectures, correspondence classes, and extramural lectures. Among other institutions of educational value are the public library, the museum, the national art gallery (all three in Brisbane), and many so-called 'schools of arts' in country municipalities; these are subsidised libraries with reading rooms attached, and are often connected with halls in which lectures or entertainments are given.

See AUSTRALIA and works there cited. Russell's *Genesis of Queensland* is a lively account of the early days of settlement. *The Geology and Palaeontology of Queensland*, by Jack and Etheridge, is a valuable work, but needs bringing up to date. *Northmost Australia* (1922), by the late R. Logan Jack, gives an exceptionally detailed and accurate account of the northern districts and their exploration.

Queensland Nut, the edible nut of the Australian proteaceous genus *Macadamia*, with a taste like the hazel-nut.

Queen's Metal, a kind of Britannia Metal (q.v.).

Queen's Tobacco-pipe, the facetious designation of a peculiarly shaped kiln which stood by the Tobacco Warehouses of London Docks. The kiln consisted of a circular brick stalk, bulging out at the bottom to a width of five feet inside. In the interior were piled up damaged tobacco and cigars, and contraband goods, such as tobacco, cigars, tea, silk, &c., which had been smuggled, books which were attempted evasions of the Copyright Act, &c., till a sufficient quantity had accumulated, when the whole was set fire to. The total value of the goods thus destroyed was enormous; and though this wanton destruction was often censured, government till 1891 continued from time to time to fill and light the 'Queen's Pipe.' Seized goods are now distributed to inmates of public institutions or sold at 'custom sales,' though worthless stuff is still burned.

Queensdown, now COBIT, a seaport of Ireland, on the south side of Great Island, in the harbour of Cork, by rail 12 miles S.E. of the city of Cork and 177 S.W. of Dublin. Its name of Cobli (or Cove of Cork) was changed to Queensdown to commemorate a visit of Queen Victoria in 1849, but resumed in 1920. The town is built in parallel streets on the slopes of a hill shaped like an amphitheatre. It enjoys a high reputation for its mild and salubrious climate (similar to Torquay), and is a health and bathing resort. The splendid Roman Catholic cathedral for Cloyne diocese is the principal building. Queensdown is an important port of call, the mails between Ireland and the United States being landed and taken on board here. Pop. 8200.

Queen's Town stands on an arm of the Khas Smiti River on a plateau (3544 feet) between the Stormberg and Katberg mountains, in the east of the Cape Province, 164 miles N.W. of East London; pop. (1921) 12,868 (7637 natives).

Quelpart, an island 60 miles off the south coast of Korea, about 40 miles long by 17 broad. It is rock-bound and mountainous, the volcano Mount Anckland being 6500 feet high. It has fertile soil and good timber, and is populous.

Quercitron, the name both of a dye stuff and of the species of oak of which it is the bark. This oak (*Quercus velutina*), also called Dyer's Oak and Yellow-barked Oak, is a native of North America, one of the noblest forest trees of the United States, found in New England, and as far south as Georgia, although there only at a considerable elevation.

Querétaro, an important town of Mexico, capital of Querétaro state (see MEXICO), is charmingly situated on a hilly plateau, 6000 feet above sea-level, 153 miles by rail N.W. of Mexico city. It contains a government palace, a cathedral (c. 1535), a lengthy aqueduct 90 feet high, and in the vicinity large cotton-spinning mills. Here the Emperor Maximilian (q.v.) was shot. Pop. 35,000. —The state is important agriculturally; fruit-farming is considerable. There are valuable opal mines.

Quern, a primitive mill for grinding corn, the stone of which was turned by the hand. Querns occur in the Scottish Earth-houses (q.v.), or cyclopean underground dwellings; in the lake-dwellings of Ireland, Scotland, and Switzerland; and abundantly among the remains of the Roman period in Britain and northern Europe. The most usual form of quern consists of two circular flat stones, the upper one pierced in the centre with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasionally ornamented with various devices; in the

Roman period it is sometimes funnel-shaped, with grooves radiating from the centre. In using the quern, the grain was dropped with one hand into the central opening, while with the other the upper stone was revolved by means of a stick inserted in a small opening near the edge. Though as early as 1284 an effort was made by the Scottish legislature to supersede the quern by the water-mill, hand-mills were largely used in Scotland down to the beginning of the 19th century. Probably the oldest British type of quern was that fashioned from a section of oak. A less simple variety, the Pot Quern, consisted of a circular stone basin, with a hole through which the meal or flour escaped, and a smaller circular stone fitting into it, perforated with an opening through which the grain was thrown into the mill.

Quesnay, FRANÇOIS, a great French economist, was born at Mérey, near Montfort-l'Amaury, June 4, 1694, studied medicine and surgery at Paris, and in 1718 commenced practice at Mantes. He acquired a high reputation in his profession, and at his death on December 14, 1774, was first physician to the king. But the fame of the 'European Confucius,' as he was called by his followers, depends upon his speculations in political economy, in the pages of the famous *Encyclopédie* (articles 'Fermiers' and 'Grains'), and various serials. Around him and his friend, M. de Gournay, gathered the famous group of the *Economistes*, also called the Physiocratic School (q.v.; and see POLITICAL ECONOMY). Quesnay's views were systematically set forth in a little treatise, entitled *Tableaux Économiques*. Only a few copies of this work were printed about the end of the year 1758, and these have now all disappeared; yet the principles maintained by Quesnay are well known, both from the sources above mentioned, and from other treatises that have met with a better fate - his *Maximes Générales du Gouvernement Économique d'un Royaume Agricole*, the notes to which occupy more space than the text; *Le Droit Naturel*, included in the *Physiocratie* of Dupont de Nemours; *Analyse du Tableau Économique*; *Problèmes Économiques*; and *Dialogues sur le Commerce et sur les Travaux des Artisans* - collected in Oncken's edition of his *Œuvres Économiques et philosophiques* (Frankfurt, 1888).

Quesnel, PASQUER, a French theologian, was born at Paris, July 14, 1634, and, after a distinguished course in the Sorbonne, entered the Congregation of the Oratory in 1657. So great was his reputation for learning and piety that at the age of twenty-eight he was appointed director of the Paris house of his Congregation. It was for the use of the young men under his care that he commenced the celebrated series *Reflexions Morales sur le Nouveau Testament*. In 1675 he published an edition of the works of Leo the Great, which in the notes was held to maintain Gallicanism (see GALLICAN CHURCH), and was accordingly placed on the *Index*. Having refused to subscribe the formula condemnatory of Jansenism required by a decree of 1684 from all members of the Oratory, Quesnel saw himself compelled to flee to the Low Countries, where he attached himself to Arnauld. He continued at Brussels his *Reflexions*, which were published in a complete form, with the approval of the Cardinal de Noailles, Bishop of Châlons, and ultimately Archbishop of Paris (1693-94). The Jesuits were unceasing in their malignant hostility, and Quesnel was denounced and flung into prison, but escaped to Holland. His book was finally condemned in 101 several propositions by the celebrated bull *Unigenitus* (1713). Quesnel spent his last years in Amsterdam, where he died December 2, 1719. A complete list of his many

books will be found in Moréri's *Dict. Hist.* His Letters were edited by Le Courayer (1721-23). For the later history of Jansenism, see Séché, *Les Derniers Jansénistes* (1891).

Quételet, LAMBERT ADOLPHE JACQUES, a celebrated Belgian statistician and astronomer, was born at Ghent, 22d February 1796, and studied at the lyceum of his native city. Here at eighteen he began to teach mathematics, and five years later was appointed to this chair at the Brussels Athenaeum. He superintended the building of the Royal Observatory, and became its director in 1828, while in 1836 he accepted the chair of Astronomy and Geodesy at the Brussels Military School. From 1834 he was perpetual secretary of the Belgian Royal Academy. He died 17th February 1874. His scientific work lay mostly in the regions of meteorology and statistics relating to anthropology. His greatest book is *Sur l'Homme et le Développement de ses Facultés* (1835), in which he sums up his researches on the physical and intellectual qualities of man. Both in this and in later work in the *Bulletin de la Commission Centrale de Statistique*, in *l'Anthropométrie, ou Mesure des différentes Facultés de l'Homme* (1871), and in other books and papers he shows the use that may be made of the theory of probabilities, as applied to the 'average man' - at times carrying out that method so as to arrive at a mechanical precision not justified by facts, and rejected by later writers on 'mind statistics.' Quételet's contributions to meteorology, astronomy, terrestrial magnetism, &c., in the *Mémoires* and *Bulletins* of the Belgian Royal Academy, were numerous and important. See Maillay's *Essai sur la Vie et les Travaux de Quételet* (1875), and Wolowski's *Éloge* (1875).

Quetta, known locally as Shalkot, a town near the north frontier of Beluchistan, strategically important as commanding the Bolan Pass and the Pishin Valley. Since 1887 it has been connected with the Indian railway system, and since 1877 Quetta and its district have been administered by British officers; it is now the headquarters of the British agent in Beluchistan, and of a considerable military force, and is strongly fortified. The valley is fertile, well watered, and populous. Coal and petroleum were discovered in 1890. Pop. 49,000.

Quetzal. See TROGON.

Quetzalcoatl. See MEXICO

Quevedo y Villegas, FRANCISCO GÓMEZ DE, was born at Madrid in 1580. His father was secretary to the queen, and his mother one of her ladies-in-waiting. The Quevedos were one of the old families of the Montaña, the mountain-region between Burgos and Santander. The name was no doubt derived from a place on the Besaya River, but the punning motto of the scutcheon on their house in the adjacent Toranzo valley, 'I am he who stopped - *el que oedd* - the advance of the Moors' expressed the family tradition, and, like others of the race, Quevedo was not a little proud of an ancestry that claimed a share in stemming the tide of Moslem conquest. Villegas was the name of his grandmother's family. He was left an orphan at an early age, and sent by his guardian to the university of Alcalá, where he won for himself a name for varied scholarship. He was attracted to the court of Philip III., but the issue of a duel, in which he killed his opponent, drove him in 1611 to the court of his friend the Duke of Osuna, the new viceroy of Sicily; and he, perceiving in Quevedo, poet, scholar, and bookworm as he was, the capacities of an able administrator and diplomatist, made him his right-hand man, and when promoted to the viceroyalty of Naples chose him as his minister of finance, an office in which

Quevedo's success was only equalled by his integrity.

He was involved in the fall of Osuna in 1619, and kept in prison for a time, but there was in fact nothing to tax him with except fidelity, and he was permitted to retire to La Torre de Juan Abad, a small estate of his in the Sierra Morena; he was allowed, however, to return to Madrid on the death of Philip III., and became a *persona grata* at the court of Philip IV. In 1626 he published his most important work, the *Política de Dios*, sketched probably in Italy, but put into shape during his banishment. He had seen for ten years the working of one-man rule in its worst form under the autocracy of the Duke of Lerma, and in the *Política* he made an earnest and eloquent appeal to the king to be a king, not in name only, but in fact. "The heart of the king," he said, "must be in no hand but God's." In 1628 he followed up his attack on government by favourites in an apologue entitled *Hell Reformed*. He remained, however, on friendly terms with Olivares; and if honours and high place could have tempted him he might have had anything in the minister's gift. But Quevedo had no mind to be a favourite's favourite, and all that he could be got to accept was the purely honorary title of secretary to the king. In the winter of 1639 a way presented itself to Olivares of ridding himself of a man who had an awkward knack of telling the truth in a way that brought it home to the public. A memorial in verse to the king, imploring him in respectful and loyal language to look with his own eyes to the miserable condition of his kingdom, was one day placed in his napkin on the royal table. Quevedo was denounced as the author (and no doubt he was, though his biographer, Dr de Tarsia, strives to disprove it), and was arrested at night and carried off to the convent of San Marcos at León, where, heavily ironed, he was lodged in a cell below the level of the river that washes the convent wall. Cold and damp brought on an illness from which he never recovered. He appealed to Olivares, but Olivares represented the king as implacable. In 1643, however, the count-duke fell from power, and Quevedo was free to return to Madrid, broken in health and fortune; all his property within reach had been seized, with his books and papers. After a year in Madrid he went home to La Torre; but the next year his sufferings became so acute that he had to remove to Villanueva de los Infantes for medical aid, and there he died in September 1645.

Quevedo was one of the most prolific Spanish poets, and was ranked by his contemporaries with Juan de Mena, Garcilaso, Lope, and Góngora; but he wrote no poetry for the world. Except those verses in the *Flores de Espinosa* (1605), the few pieces published in his lifetime were printed without his consent. Poetry was with him a recreation and a solace, and, according to his nephew, some of his gayest and brightest verses were written in his cell at San Marcos. His poetry therefore is for the most part of an occasional character, and to a great extent made up of what would now be called *vers de société*: sonnets, serious and satirical, form a large portion of it, and light humorous ballads and songs a still larger. His more ambitious work is at times disguised by conceits, but that it is the work of a true poet no one will dispute. All through life he was at war with the poets of the 'Culto' School, Góngora and his followers ('the scourge of silly poets' Cervantes called him), and this perhaps may have made him chary of appearing in public as a poet; but if he took no pains to place himself upon the roll of Spanish poets, he added to it the names of Francisco de la Torre and of Luis de León, whose poems he published in 1631. His place as a dramatist is not so well defined.

About a dozen of his interludes are extant; but of his comedies, except two of which he was joint-author with Antonio de Mendoza, nothing is known. His prose is even more multifarious than his verse. His first book was a life of St Tomás de Villanueva in 1620, and his last, in 1644, a life of St Paul; and the greater part of his prose is of the same character, as is indicated by the titles: *The Patience and Constancy of Job*, *The Cradle and the Grave*, *Virtue Militant*, *The Martyrdom of Marcelo Mastullo*, *Instruction how to Die*, *The Introduction to Devout Life*, from St Francis de Sales, and others of the same kind. Of his political works the *Política de Dios* is the chief; but he also wrote a *Life of Marcus Brutus*, to which he was adding a second part when struck down by his last illness, a *Letter to Louis XIII.* on the war of 1635, and several shorter tracts. In 1626, at Saragossa, his brilliant picaresque novel, the *Vida del Buscón Pablos*, or, as it was called after his death, the *Gran Tocaño*, was printed, apparently, like most of his books, without his permission, and at once took its place beside *Guzmán de Alfarache*; and in 1627 his five *Visions*, four of which had been written between 1607 and 1610, and the fifth in 1621, were printed in the same way at Barcelona. His friend, Vander Hammen, printed three of them at Saragossa from his own copies, and added the *Casa de los locos de Amor* ('The Madhouse of Lovers'), which thenceforward was wrongly attributed to Quevedo, though he himself disowned it; and Vander Hammen afterwards confessed himself the author. Chiefly for the sake of the vision or apologue of *Hell Reformed*, a sort of offshoot or sequel to the *Política de Dios*, he wished the *Visions* to appear in an authorised edition at Madrid; but unluckily they were submitted for examination to the Padre Niseno, a friend of Montalván, the dramatist, who had a grudge against Quevedo, and to obtain a licence he had to consent to barbarous mutilations of his work, which in some places make utter nonsense of it; and it is in this mangled shape the *Visions* have been printed ever since 1631. He added some short humorous pieces, on the affections of the Culto school, the use of vulgar slang phrases, silly popular beliefs, and the like; and, the better to mask the design of the others, he called the volume *Juguete de la Niñez* ('Playthings'), and apologised for the whole as the work of his youth, though the principal piece was written only three years back. The vision or apologue was Quevedo's favourite form of expression; his peculiar humour and satire are nowhere better seen than in *Fortuna con Seso* ('Fortune Right'), written in 1635, but not printed till 1650, in which Fortune demonstrates by experiment that if strict logic and justice took her place mankind would have a great deal more to complain of.

There is a good edition of Quevedo's works in the *Biblioteca de Autores Españoles* (vols. xxiii and xxlviii, prose, edited by Anichino Fernández-Guerra; vol. lxxix, verse, edited by Florencio Janer). The volume of verse follows the stupid pedantic arrangement of the 17th-century editors. Editions followed his death in quick succession, but most of them are slovenly in editing, paper, and print. A handsome edition in 3 vols. 4to was issued by Foppens (Brussels, 1660-71), and well printed, if not critical ones by Ibarra (6 vols. 8vo, Madrid, 1772), by Sancho (11 vols. 8vo, Madrid, 1791-34), and by Castellanos (5 vols. 8vo, illustrated, Madrid, 1841-45); and an admirable selection (which in Quevedo's case is not only a defensible but a desirable form) was published by Villalpando (6 vols. 12mo, Madrid, 1798).

The Sieur de la Geneste translated the *Visions* into French in 1633, the *Hell Reformed* in 1634, and the *Vida del Buscón* (1633 or 1641). His versions are by no means faithful or accurate, but they have the advantage of being based upon Quevedo's original text. From them most of the best English versions have been made—e.g. *Visions*; or *Hell's Kingdom*, by R. Croshawe (1640); *Hell Reformed*,

by E. M. (1641); *Buscon, the Witty Spaniard*, by J. Davies (1657); and the lively version of the *Visions* by Sir R. L'Estrange (1667). Captain John Stevens in 1697 translated *Fortuna con Seso, the Vida del Buscón*, and some shorter pieces in 1707; his translations, together with L'Estrange's *Visions*, were published in 3 vols. at Edinburgh in 1798 as *Quervo's Works*. The best French translation of the *Vida del Buscón* is D'Hermilly's *Fin Mutois* (1776). Under the title of *Voyages récréatifs de Quervo* four of the *Visions* were very freely rendered by the Abbé Beraud in 1756. In 1648 Hans Moscheroseh gave a still more free German version under the title of *Wunderliche Gesichte Phälander's von Sittewald*; and in 1841 Dr Guttenstein treated the *Buscón* in much the same fashion in *Der Glücksritter*. An Italian translation of the novel by G. P. Franco appeared in 1634.

Quezaltenango, the second city of Guatemala, the capital of a department of the same name, is on the Sigüila, 70 miles W. by N. of Guatemala city. It contains an ornate church, handsome government buildings, national colleges, and a conservatorium. The houses are built of a light brown lava from the Cerro Quemado ('Burned Mountain'), which overhangs the city. Quezaltenango is the centre of the trade in native cloths, also in grain and coffee. Its port is Champerico, on the Pacific. Pop. 30,000, mostly Indians.

Quia Emptores. See FEUDALISM.

Quiberon, a small fishing-town of France (dept. Morbihan), at the extremity of a long narrow peninsula, 21 miles SW. of Vannes; pop. 3500. It was here that a body of French emigrant royalists landed from an English fleet in 1795 and endeavoured to rouse the people of Brittany and La Vendée against the Convention, but were defeated and driven into the sea by General Hoche. Nearly all the prisoners taken were shot by order of the Convention. On 20th November 1759 Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay.

Quichua, the language of the Indians of Peru (q.v.).

Quick, ROBERT HERBERT, was born in 1832, and passed from Harrow to Trinity College, Cambridge. He took orders, held curacies in White chapel and Marylebone, and was appointed by his college to the vicarage of Sedburgh in 1883, but four years later resigned the living. The great interest of his life was education, and to the discussion of its theories he brought wide study, independent thought, and ripe wisdom; witness his *Essays on Educational Reformers* (1868; 2d ed. 1890). His practical knowledge of the work of teaching he had gained by service at Cranleigh, Harrow, and elsewhere. He died at Cambridge, 9th March 1891. See his *Life by Storr* (1899).

Quickens. See COUCH-GRASS.

Quicksand (*quick*—i.e. 'living' or 'moving,' and *sand*), in its usual significance, a tract of sand which, without differing much in appearance from the shore of which it forms part, remains permanently saturated with water to such an extent that it cannot support any weight. Quicksands are most often found near the mouths of large rivers. They appear only to be formed on flat shores, the substratum of which is an irregular expanse of stiff clay or other impervious formation. Pools of water are retained in the hollows, and become partially filled with sand or mud, which remains like the soft sediment in a cup of cocoa on account of the absence of drainage. The sand on a uniform shelving shore consolidates at low tide because the water which permeates it drains back freely to the sea. In narrow channels through which the configuration of the adjoining shore causes strong tidal currents to run the sand may be kept so constantly stirred up by the moving water that a quicksand results. Thus, while the summit of a sandbank rising

from a gentle slope is usually firm, the hollow margin of the bank where it meets the shore is frequently a quicksand. Quicksands are not commonly of great extent, and their danger has probably been exaggerated in the popular mind by sensational descriptions in works of fiction—e.g. in the *Bride of Lammermoor* and Wilkie Collins's *Moonstone*. Persons sink in a quicksand as in water, only more slowly; and it is probable that if the victim did not struggle he would not sink over the head, as experiments show that water containing a quantity of solid matter in suspension has its floating power increased. The belief amongst sailors that a vessel stranded on a quicksand is inevitably sucked down is unfounded.

The name quicksand is sometimes applied, especially by old writers, to the drifting sands which are carried by wind over cultivated land bordering the seashore or a desert. See DOWNS, DRIFT, DUNES, and ST MICHEL.

Quicksilver. See MERCURY.

Quietism, a name given to a tendency shown at various periods in the history of the church by many classes of mystical religious enthusiasts, of widely different beliefs, to make perfection on earth consist in a condition of uninterrupted contemplation. In this state of quiet the soul ceases to reason, to reflect either on itself or God, or to form any of the ordinary acts of faith, its sole function being passively to receive the infused heavenly light which accompanies this state of inactive contemplation. The first of modern Quietists was the Spanish priest Molinos; its most famous devotee, Madame Guyon, whose gentle but powerful influence led into the same mode of thought the saintly Fénelon. Quietism has been called the Spanish analogue of Quakerism in England, of Jansenism in France, of Pietism in Germany; but these several systems, though they had common tendencies, were also sharply distinguished. It may be said that Quietism involves but little of practical consequence, whether for good or for evil. This may and does hold true in the case of noble and lofty souls like Fénelon; but what moved Bossuet and the church generally to strong opposition was the belief that, carried to its logical conclusion, Quietism led to Antinomianism, and would inevitably prove pernicious in its effects upon the vulgar crowd of followers. From the belief of the lofty and perfect nature of the purely passive state of contemplation there is, it was held, but a single step to the fatal principle in morals, that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; that good works, the sacraments, prayer, are not necessary, and hardly even compatible with the repose of the soul; that so complete is the self-absorption, so independent is the soul of corporeal sense, that even criminal representations and movements of the sensitive part of the soul, and even the external actions of the body, fail to affect the contemplating soul, or to impress it with their debasing influence. See BOSSUET, FÉNELON, GUYON, MOLINOS; also Heppé, *Geschichte der Quietistischen Mystik in der Kathol. Kirche* (1875).

Quigrich. See FILAN (ST).

Quillmane, or SÃO MARTINHO DE QUILMANE, a seaport of Portuguese East Africa, stands about 15 miles from the mouth of the river of the same name, the northern arm of the Zambezi delta.—The district of Quillmane, which is fast developing, has an area of 40,000 sq. m. and a pop. of about 1,000,000.

Quiller-Couch, SIR ARTHUR THOMAS, poet, novelist, and critical essayist, born at Polperro, 21st November 1863, was educated at Clifton and Trinity College, Oxford, where for some terms he

was a classical lecturer. After a sojourn in London he settled in 1891 in Cornwall, and became professor of English Literature at Cambridge in 1912. For several years he was a frequent contributor to the *Speaker*, but since 1887 he has been known as a popular novelist. *Dead Man's Rock*, *Troy Town*, *The Splendid Spur* secured a favourable hearing, and were followed by *The Delightable Duck*, volumes of parodies, poems and ballads, *The Laird's Luck*, *The Westrotes*, *The White Wolf*, *Hetty Wesley* (1903). He completed R. L. Stevenson's *St Ives*. *The Oxford Book of English Verse* and other anthologies established him as the Palgrave of his time. Other publications of his are *Shakespeare's Christmas* (1905), *Poison Island* (1907), *Hocken and Hauken* (1912), *On the Art of Writing* (1916), *Studies in Literature* (1918; another series, 1922), *Shakespeare's Workmanship* (1918), *On the Art of Reading* (1920); and with Professor Dover Wilson he edited 'The New Shakespeare.' He is well known by his pseudonym 'Q.'

Quilotoa, a town of Chile, in the fertile valley of the Aconcagua, 13 miles from its mouth, and 25 miles by rail N.E. of Valparaiso; pop. 12,400.

Quills are the large feathers of the wings of birds, certain kinds of which have for centuries been used to make into writing-pens. Swan, goose, and turkey yield the kinds suitable for writing purposes, crow quills being used for drawing. A quill, like horn or hair, is formed of epidermic tissue, and the barrel or tube (the quill proper) has an external membrane and an internal pith. In order to get rid of these, and to bring the naturally soft state of the barrel into a condition ready for making into a pen, it requires to be dressed. This is done by heating and scamping, or (for toothpicks) by steeping in water and manipulating in hot sand. Quill-pens have almost everywhere been superseded by steel pens.

Quilua, or KILWA, a seaport of East Africa, 190 miles S. of Zanzibar, and an outlet for the trade with Nyusaland, exports ivory, gum copal, rice, and manioc.

Quilon, a town of Southern India, in the state Travancore, is situated on the west coast, 85 miles N.W. of Cape Comorin. A settlement of the ancient Syrian Church and subsequently of the St Thomas Christians, it was, under the names Coilon and Columbum, a famous mart for the trade in timber, ginger, pepper, &c. The Portuguese built a fort there in 1503, which the Dutch took in 1661. From 1803 to 1839 it was garrisoned by the British. Pop. 25,000.

Quimper, a town of France (dept. Finistère), is prettily situated on the Odet, 11 miles from its mouth, and 63 miles by rail S.E. of Brest. It has a stately and richly-carved cathedral (1239-1515); also a college, a museum, and an agricultural school. There are potteries, tanyards, sailworks, paper-mills, some manufactures of lace, and a trade in dairy produce. Pop. 18,000.

Quin, JAMES, a celebrated actor, was born in London, of Irish descent, 24th February 1693, and made his first appearance on the stage in 1714 at Dublin. Shortly after he proceeded to London, where he was engaged at Drury Lane, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Quin's being called on to sustain the character of Bajazet in the once famous play of *Tamerclane*. His success was marked. Next year he exchanged Drury Lane for Rich's theatre at Lincoln's Inn Fields, where he remained as a principal actor for seventeen years. Not long after leaving the former place he had the misfortune to kill a brother-actor in a duel—a circumstance which clouded his reputation for a while. The only really fine parts which he seems to have played

were Captain Macheath in the *Beggars' Opera* and Falstaff in the *Merry Wives of Windsor*. In 1734 he returned to Drury Lane Theatre, 'on such terms,' says Cibber, 'as no hired actor had before received;' and from this date until the appearance of Garrick in 1741 he was by universal consent the first actor in England. In 1746 Quin and Garrick acted together in the *Fair Penitent*, as a contest for pre-eminence. The novelty of seeing the two rival actors in the same tragedy, and the admirable acting of Mrs Cibber as the Fair Penitent, contributed greatly to the extraordinary success of this play. The superiority of Garrick was acknowledged by the best judges; and Quin, by no means pleased at his rising fame, sarcastically declared that 'Garrick was a new religion, and that Whitefield was followed for a time, but they would all come to church again.' In 1751 he withdrew from the stage, and fixed his residence at Bath, where he died, January 21, 1766. In society Quin was also popular, his conversation being full of wit and his stories amusing though coarse. He had a most benevolent heart, and among his many kind actions he was able on one occasion to do a great service to Thomson by delivering him from arrest, and afterwards lived 'in fond intimacy' with the poet, as Johnson tells us in his *Lives of the Poets*. An anonymous *Life of Quin*, dedicated to Garrick in 1766, was reprinted in 1887, with a supplement of corrections and additional information.

Quince (*Cydonia*), a genus of trees and shrubs of the family Rosaceæ, distinguished from Pyrus by having many instead of two seeds in each cell, and by their very mucilaginous nature. The Common Quince (*C. oblonga*), a native of the south of Europe and temperate Asia, is a low tree, with generally tortuous branches, ovate, entire, deciduous leaves, and rather large whitish flowers, which are solitary at the extremity of young branches. The fruit is in

one variety of quince globose, in others pear-shaped, of a rich yellow or orange colour, with a strong anell. It is hard and austere, but sweetened with sugar becomes extremely pleasant, and is used either by itself or to flavour apple-pies. It is also used for making

Flowering branch of Quince (*Cydonia oblonga*):
a, ripe fruit; b, section of do.
(Bentley and Timmer.)

marmalade, to which indeed it gives the name (Port. *marmelo*, 'quince,' from Gk. *melimelon*, literally 'honey apple,' i.e. an apple grafted on a quince). A delicious beverage somewhat like cider is made from it. The seeds readily give out their mucilage to water, so that they turn forty or fifty times their amount of water into a substance as thick as syrup. Quince mucilage or quince gum, *Cydonin*, is allied to Bassorin, but differs from it in being readily soluble in water (see GUM). The quince was cultivated by the ancient Greeks

and Romans, and is at the present day cultivated in the south of Europe, in England, and generally in temperate climates. Its principal use in Britain in a commercial sense is as a stock to bud or graft the pear on. Many choice kinds of pear succeed better when united to it than when they are grafted on the true pear-stock. In Scotland the fruit seldom ripens except on a wall. The Japanese Quince (*C. japonica*, better known as *Pyrus japonica*), a low bush, a native of Japan, but perfectly hardy in Britain, is often to be seen trained against walls, being very ornamental from the profusion of its beautiful flowers, usually a rich red in colour.

Quincey, DE. See DE QUINCEY.

Quincy, (1) city of Illinois, and capital of Adams county, is on the Mississippi River, 160 miles above St Louis and 262 by rail SW. of Chicago. It is handsomely built on a high bluff, has a large trade in grain, live-stock, &c., by river and rail, an important railway bridge crossing the river at this point. The public buildings include a fine courthouse, a medical college, several hospitals and asylums, an Episcopal cathedral, and many other churches. The city has flour-mills, machine-shops, foundries, saw- and planing-mills, and produces stoves, furniture, carriages, tobacco, bricks, &c. Pop. (1890) 31,494; (1920) 35,978.—(2) A town of Massachusetts, near the sea, and 8 miles S. of Boston. The township does shipbuilding, produces the famous Quincy granite, and was the birthplace of John Adams and John Quincy Adams. Pop. (1880) 10,570; (1920) 47,876.

Quincy, JOSIAH, an American orator and man of letters, and son of Josiah Quincy (1744-75), an eloquent advocate of the rights of the colonists, was born at Boston, 4th February 1772, graduated at Harvard in 1790, and was called to the bar in 1793. He took an active interest in politics as a leading member of the Federal party in New England, and entered congress in 1804, and became distinguished as a ready, earnest, and fervent orator. He was one of the earliest to denounce slavery; but his most remarkable speech was one in which, spurred on by the jealousy with which the old New England colonies regarded the new western states, he declared that the admission of Louisiana would be a sufficient cause for the dissolution of the union, and that, 'as it would be the right of all, so it would be the duty of some, to prepare definitely for a separation—peaceably if they could, violently if they must.' Disgusted with the triumph of the Democratic party and the war of 1812, he declined a re-election to congress, and devoted his attention for a while to agriculture. He was, however, a member of the Massachusetts legislature during most of the next ten years, served as mayor of Boston from 1823 to 1828, and in 1829 accepted the post of president of Harvard, which he held until 1845. His remaining years were spent in quiet literary work, and he died at Quincy, 1st July 1864. Among his published works are *Memoirs of his father* (1825) and of J. Q. Adams (1858), and histories of Harvard University (1840), of the Boston Athenæum (1851), and of Boston (1852). His *Speeches* were edited (1874) by his son, Edmund Quincy (1808-77), who was secretary of the American Anti-Slavery Society, and contributed largely to the Abolitionist press.

Quinet, EDGAR, French writer, was born of an old Catholic family at Bourg (Ain) on 17th February 1803. His mother, whose dreamy and emotional nature he inherited, was a Protestant. He spent great part of his boyhood in the remote and dreary solitudes of Certines near Bourg. His parents, both ardent republicans, hated the very name of Napoleon. Accordingly the boy early

made him a hero in his heart; but as he grew up a passion for liberty superseded his first love. Educated at Bourg and Lyons (1817-20), he next went to Paris; but, refusing to take the course for a soldier at the École Polytechnique, he published *Les Tablettes du Juif Errant* (1823) in justification of his choice of a profession. He found the spiritual impulse that he needed in an English translation of Herder's *Philosophy of History*, which he translated into French (1825), although he had first to learn German to do so. His remarkable Introduction procured him the friendship of Cousin, at whose house he met Michelet, for fifty years the 'brother of his heart and mind.' He had already travelled in Germany, Italy, and England, when in 1829 he was appointed to a post on a government mission to Greece. The fruit of his travels was *La Grèce Moderne* (1830). A speculative republican of ideas, one of the earliest writers for the *Revue des Deux Mondes*, and a student before their time of the old Chansons de Geste, Quinet played a conspicuous part in the Paris of his day, and made his name known beyond its walls by his *Althusser* (1833), a kind of spiritual imitation of the ancient mysteries, followed, after his marriage in 1834, by his less successful poems, *Napoleon* (1836) and *Prométhée* (1838), the three works forming a kind of trilogy, in which Althusser represents the race, Napoleon the individual, and Prometheus the martyr. In 1838 he published his *Examen de la Vie de Jésus*, in which he shows that Strauss is too analytic to detect the true principle of life in the gospels. Quinet's deepest conviction was that religion is the very substance of humanity, that the true founders of society have been teachers like Zoroaster and Moses, and that Christianity itself is the apotheosis of personality.

Appointed in 1839 professor of foreign literature at Lyons, he began those lectures which afterwards formed his brilliant book, *Le Génie des Religions* (1842). He was now recalled to Paris to the chair of 'Littératures Méridionales' at the Collège de France, where for four years he lectured on such themes as the revolutions in Italy, the Jesuits, Ultramontanism, and Christianity in relation to the French Revolution. He joined Michelet in attacking the Jesuits, and the blow he struck the order was the deadliest it had received in France since the days of Pascal. But his lectures caused so much excitement that government suppressed them in 1846. After the Revolution, in which Quinet took his place on the barricades, he was elected to represent Ain in the National Assembly, where he voted in the Extreme Left. He was little of a practical statesman, but from the beginning he saw the traitor under the mask of Louis Napoleon. After the *coup d'état* he was exiled to Brussels, whence in 1858 he migrated to Vevyranx on the shores of the Lake of Geneva. His mother had died in 1847, his wife in 1851, and soon after his exile he married the daughter of a Rumanian patriot, George Asaky. At Brussels he produced *Les Esclaves* (1853), and an edition of the chief writings of Manix de Ste Aldigonde (1856); and in Switzerland *Merlin l'Enchanteur* (2 vols. 1860), a book of enormous rhetorical power, lofty but ill-sustained thought, and dazzling imagery. Other works were *La Révolution Religieuse au XIX^e. Siècle* (1857); *Histoire de mes Idées* (1858), a delightful fragment of an autobiography; *Histoire de la Campagne de 1815* (1862); *La Révolution* (1865), demonstrating that its frightful crimes were the fruit of the suspicions and mistrust begotten by twelve centuries of despotic education. After the downfall of Napoleon III. he returned to Paris, and during the siege strove to keep aglow the expiring fire of patriotism. He sat in the National Assemblies

at Bordeaux and Versailles, and aroused great enthusiasm by his impassioned if somewhat vague orations. He died at Versailles, 27th March 1875.

Quinet's latest books were *La Création* (1870), a characteristically bold and imaginative incursion into the domain of science; *La République* (1872); and *L'Esprit Nouveau* (1874). *Le Livre de l'Exilé* appeared posthumously. His wife published in 1870 *Mémoires d'Exil*; his *Correspondance Inédite* followed in 1877 (2 vols.); his *Lettres d'Exil à Michelet et à Divers Amis* in 1884-86 (4 vols.); and his *Lettres à sa Mère* (2 vols.) in 1885; *Lettres Inédites* in 1907. An edition of his *Œuvres Complètes* in 30 vols. (1857-79) was issued as a national tribute. See the biography by Chassin (1859); *Edgar Quinet depuis l'Exil* (1889), and *Quinquante Ans d'Amitié* (1900), by his widow; Richard Heath's *Edgar Quinet: His Early Life and Writings* (1881); also the essay by Professor Dowden in *Studies in Literature* (1878); J. Texte's *La Jeunesse de Quinet* (1897).

Quinine is an alkaloid having the chemical formula $C_{20}H_{24}N_2O_6 \cdot 3H_2O$. Along with cinchonidine, cinchonine, and a large number of other alkaloids, it is present in the bark of numerous species of cinchona and Remijia, of which these substances constitute the active medicinal principles. Good barks yield an average of 5 to 6 per cent. total alkaloids, of which one-half is quinine and cinchonidine, the other half consisting of the other alkaloids in varying proportions. Quinine is by far the most important from a medical and commercial point of view; the yield of it varies greatly, $\frac{1}{2}$ and 8 per cent. being the extremes. Quinine is obtained from the powdered bark by treating it with lime, and then extracting the mixture with alcohol, neutralising with an acid so as to obtain a salt of quinine, and finally purifying the product. In 1820 Pelletier and Caventou isolated pure quinine and demonstrated that it was the chief active ingredient in the bark. Many attempts have since been made to prepare it artificially, but without success. For the history of the introduction of the bark into Europe, and the culture of the tree in South America, India, Ceylon, and Java, see CINCHONA.

Quinine itself is not used in medicine, owing to the inconveniences arising from its insolubility in water, but many of its salts are, and three of them, the sulphate, hydrochloride, and acid hydrochloride are included in the British Pharmacopœia along with numerous preparations of cinchona-bark containing them. The sulphate is the most commonly used preparation, and it is popularly known as quinine. It occurs in small, silky, snow-white crystals, which have a purely and intensely bitter taste, and are sparingly soluble in water (1 in 800 parts); its solutions have a bluish or fluorescent colour even when very dilute. In alcohol or dilute sulphuric acid it is very soluble. The hydrochloride closely resembles the sulphate, but is much more soluble to water (1 in 36 parts), and its solutions are not fluorescent. The acid hydrochloride is more soluble still (less than 1 part water). When treated with excess of chlorine water and a few drops of ammonia solution, solutions of quinine give a clear emerald green colour; if ferrocyanide of potassium be added, this changes to a ruby-red.

Preparations of quinine, and especially the sulphate, are very largely used in medicine. Locally applied, dilute solutions (1 or 2 per cent.) have a germicidal, antiputrefactive, and antifermentative action, hence they are used as lotions in hay-fever, diphtheria, cystitis, and similar diseases. As a bitter tonic, small doses ($\frac{1}{2}$ to 2 grains) are frequently given in general debility, atonic dyspepsia, anaemia, scrofula, convalescence from acute diseases, and other conditions where tonic treatment is required. It is also of great value as an antipyretic and antiperiodic. In healthy persons it does not reduce the bodily temperature, but in typhus,

typhoid, rheumatic, and some other fevers it is extremely active in this respect. A dose of 3 to 15 grains may be given in these cases. In certain fevers it does not reduce temperature. In malarial affections of all kinds it is supreme, and at present no other known drug can compare with it in efficacy. In intermittent fevers and ague the best plan is to begin its administration about six hours before the attack is expected, and continue it in hourly doses for three or four hours until 1 to 2 grams have been given. It cuts short or aborts the recurring febrile attacks. It is also of great value as a prophylactic in persons who are exposed to the risks of malarial poisoning. In such cases 20 centigrams twice daily is usually considered a sufficient dose. Its action in malaria is due to a specific poisonous effect on the protozoan organism which is the cause of the disease.

Quinine is also given in neuralgia and in inflammations. Large doses are very apt to irritate the stomach, and sometimes produce a train of symptoms known as cinchonism. There is singing in the ears, dizziness, deafness, a feeling of fullness in the head, and disturbance of vision—all of which usually pass off without leaving any ill results. In some cases the effects are more severe, and may lead to dangerous depression and collapse, especially if the patient be already weakened by disease. Certain persons are very susceptible to the action of quinine, and suffer from cinchonism after small doses. In others skin eruptions, oedema of the face, irritation of the bladder and kidneys, and other disagreeable effects are sometimes seen. Workers in quinine-factories also occasionally suffer from skin eruptions. These accidents are, however, comparatively rare.

The sulphate of cinchonidine and sulphate of cinchonine have the same actions and uses as quinine, but are very much less used. They seem, however, to be efficacious, and are cheaper.

Quinoa (*Chenopodium Quinoa*), a valuable food-plant, a native of Chile, which much resembles some of the British species of *Chenopodium* (q.v.). In the countries in which it is indigenous it is much cultivated for its seeds, which form a principal food of the inhabitants. The meal made from some varieties of the seed has a somewhat peculiar flavour, but it is very nutritious, and is made into a kind of porridge and cakes. The plant is sometimes cultivated in British gardens for its leaves, which are a good substitute for spinach.

Quinolone, a pungent colourless liquid obtained by the distillation of bones, coal-tar, and various alkaloids. It is the base of many organic bodies, and is isomeric with Lencoline (q.v.).

Quinquagesima (Lat., 'fiftieth'), the Sunday immediately preceding Ash-Wednesday. The common explanation of the name Quinquagesima, and of Sexagesima and Septagesima, the two preceding Sundays, is that the Sundays are, roughly speaking, about fifty, sixty, and seventy days respectively before Easter. Quinquagesima, indeed, is exactly fifty days before the Octave of Easter—i.e. Low Sunday (q.v.). But probably the terms were adopted without any intention of expressing definite numbers, and simply on a false analogy with Quadragesima, the Latin name of Lent.

Quinqueremes, vessels with five banks of oars, however arranged (see TRIRÈME), may be regarded as the first-rates of the ancient navies.

Quinsy (originally *spuynancy*; Fr. *esquinancie*; from Gr. *kynanchê*), known also as *Cynanche Tonsillar* and *Tonsillitis*, or as 'inflammatory sore throat,' is an inflammatory affection of the substance of the tonsils, attended when fully developed by suppurative (see PALATE). The inflammation is seldom limited to these glands, but extends to

the uvula, the soft palate, and the pharynx. The disease usually manifests itself by difficulty in swallowing, and a sense of heat and discomfort in the throat, often amounting to considerable pain. On examination the throat at first exhibits unnatural redness, with enlargement of one or both tonsils. The uvula is enlarged and elongated, its end either dropping down into the pharynx, and, by exciting the sensation of a foreign body, giving rise to much irritation, or else adhering to one of the tonsils. The tongue is usually furred, and the pulse rapid, and there are the ordinary symptoms of that form of constitutional disturbance known as inflammatory fever. The inflammation terminates either in resolution (if the attack is not severe, and yields readily to treatment) or in suppuration, which may be detected by the occurrence of slight rigors, and by the increased softness of the enlarged tonsil. The matter which is discharged has sometimes a very fetid smell, and the fetor may be the first indication of the rupture. The pain almost entirely ceases with the discharge of matter, and recovery is then rapid. The disease usually runs a course of from three to seven days; but it may be prolonged if, as sometimes happens, the two sides are successively affected. It almost invariably terminates favourably. It is most common between the ages of fifteen and twenty-five. The ordinary exciting cause of this disease is exposure to cold, especially when the body is warm and perspiring; and certain persons (or even families) are so subject to it that slight exposure is almost sure to induce it.

The patient should remain in the house (or, in cold weather, even in bed), and should be kept on low, non-stimulating diet. At the beginning of the illness the favourite remedy is salicin or salicylate of soda in 10- or 20-grain doses with an equal quantity of bicarbonate of soda; or the latter may be taken alone and held for some time in the mouth before swallowing. Painting the outside of the neck with tincture of iodine or other counter-irritant in the early stages may help to prevent an abscess, but later should be avoided. The inside of the throat may be painted with glycerine of borax, or other mild antiseptic; and inhalations of steam containing eucalyptus oil or Friar's balsam give relief. Hot poultices to the outside of the neck or simply a warm woollen wrap are also soothing. When pus has definitely formed, as shown by redness and bulging of the tonsil or palate, opening of the abscess gives immediate relief. This should be followed by warm antiseptic gargles, such as permanganate or chlorate of potash, &c.

Quintain, an instrument used in the ancient practice of tilting on horseback with the lance. It consists of an upright post, surmounted by a cross-bar turning on a pivot, which has at one end a flat board, at the other a bag of sand. The object of the tilter is to strike the board at such speed that he will be well past before the bag of sand, as it whirls round, can hit him on the back. At Offham, in Kent, 7 miles WNW. of Maidstone, there are the remains of an old quintain; and at the May games held at St Mary Cray in Kent, near Bromley, in 1891 the quintain was also revived.

Quintal, a French weight corresponding to the English 'hundredweight,' was equal to 100 pounds (livres); on the introduction of the metrical system the same name was employed to designate a weight of 100 kilogrammes (see GRAMME). The metrical quintal, equivalent to 220 lb. avoirdupois, is thus more than twice as heavy as the old one.

Quintana, MANUEL JOSÉ (1772-1857), whose patriotic odes obtained for him the surname of the

'Spanish Tyrtæus,' was born at Madrid, studied at Salamanca, and established himself as an advocate in his native city, where his house became a resort of the advanced liberals of the time. Besides his Spanish Plutarch (*Vidas de Españoles Célebres*, 1807-34), a work which is reckoned one of the finest Spanish classics, he published one or two tragedies, and an excellent selection of Castilian poetry. On the restoration of Ferdinand VII. in 1814 Quintana's liberalism caused his imprisonment for six years; but he ultimately forsook the cause and held office.

Quintana Roo. See YUCATÁN; also MEXICO.

Quintett, or QUINTET, a musical composition for five solo voices, or for five instruments, each of which is *obligato*. Quintetts for strings have been written by Boccherini, Beethoven, Mendelssohn, Schubert, &c.; for other combinations of instruments, generally including the pianoforte, by Mozart, Schubert, Schumann, Brahms, and Raff. Of vocal quintetts, one of the most notable is that in Wagner's *Meistersinger*.

Quintilian. M. Fabius Quintilianus was born about 35 A.D. at Calagurris (*Calahorra*), in Spain, and attended in Rome the prelections of Domitius Afer, who died in 59. After this date, however, he revisited Spain, whence he returned in 68 to Rome in the train of Galba, and began to practise as a pleader in the courts, in which capacity his reputation became considerable. He was more distinguished, however, as a teacher than as a practitioner of the oratorical art, and his instructions came to be the most eagerly sought after among all his contemporaries, his pupils including Pliny the Younger and the two grand-nephews of Domitian. As a mark of this emperor's favour he was invested with the insignia and title of consul; while he also holds the distinction of being the first public teacher who benefited by the endowment of Vespasian, and received a fixed salary from the imperial exchequer. His professional career as a teacher of eloquence commenced probably about 72, but after twenty years of labour as advocate and teacher he retired into private life, and died probably soon after 96. His reputation rests securely on his great work entitled *De Institutione Oratoria Libri XII.*, a complete system of rhetoric, which he dedicates to his friend Victorius Marcellus, himself a court favourite and orator of distinction. It was written—as he tells us in his preface to his publisher Trypho—after he had ceased to be a public teacher, and was the fruit of two years' labour. In the first book he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator, and he gives us an elaborate outline of the mode in which children should be educated in the interval between the nursery and the final instructions of the grammarian. The second book treats of the first principles of rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while that of the eighth, ninth, tenth, and eleventh is style (*locutio*), with memory and delivery. Of these the eighth and ninth discuss the elements of a good style; the tenth, the practical studies requisite; the eleventh, appropriateness, memory, and delivery. The last, and in the author's view most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to adopt, the age at which pleading should be begun, and at which it should be left off, and other

allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, admirable form, and the perfect familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences has always been admired for its clearness, width of intellectual sympathy, and vigour. Quintilian's own style is excellent, for though he is not free from the love of florid ornament and poetic metaphor characteristic of his age, he was saved from its extremes by his good sense, which refused to sacrifice clearness and simplicity to effect, and still more, by his wholesome admiration for Cicero. The style of Seneca he discusses almost as fully as he does that of Cicero, denouncing it as a dangerous model for the orator to follow. He makes an obvious effort to be fair in balancing his praise and blame, but a careful reader detects an undertone of dislike, whether to Seneca's philosophy or his person. Nineteen longer and 145 shorter *Declamations* (ed. C. Ritter, 1885), which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs.

There are editions by Burnmann (1720), Spalding, compiled by Zumpt and Bonnell (1798-1834), the last volume (vi.) containing a lexicon; Halm (1868-69); Meister (1886-87); Colson (bk. i., 1924). There are English translations by Guthrie (1805), Watson (1855-56), and Butler (with text, 1921-24).

Quintus Curtius. See CURTIUS.

Quipu, the language of knotted cords which was used by the Incas of Peru before the conquest of their country by the Spaniards. A series of knotted strings was fastened at one end to a stout cord; the other ends hung free. This was used for the purpose of calculation, recording numbers and apparently dates. The colours of the strings and the order of their arrangement, the character and number of the knots, their distance from the cord to which they were connected, and the methods of their interlacing were the principal elements in this 'knotty language.' They have been found in use by present-day shepherds to keep account of their flocks. A similar custom occurs in Central Celebes. See Nordenskiöld, *Comparative Ethnographical Studies*, vol. vi. (Göteborg, 1925-26).

Quirinus. See MARS.—The QUIRINAL (Lat. *Collis Quirinalis*) is one of the seven hills of ancient Rome (q.v.), and, next to the Palatine and Capitoline, the oldest and most famous quarter of the city. For *Quirites* also, see ROME, CURIES.

Quiscalus. See GRACKLE.

Qui Tam actions are actions so called in the law of England from the first words of the old form of declaration by which informers sue for penalties, the plaintiff describing himself as suing as well for the crown as for himself, the penalty being divided between himself and the crown.

Quitch. See COUCH-GRASS

Quito, the capital of Ecuador and of the province of Pichincha, lies 9351 feet above the sea in 0° 10' S. lat., on the east side of the great plateau of Quito, at the foot of the volcano of Pichincha (q.v.). It has been connected by rail with Guayaquil since 1908. Its site, cut up with numerous ravines, is very uneven; but the streets are laid out regularly at right angles, plunging into and scaling the sides of the valleys which come in their course. One of them is arched over. The appearance of Quito is very picturesque, and its beautiful environment of mountains, together with its clear, healthy, and temperate climate maintaining an eternal spring, renders it one of the most charming cities of South America; yet the

abrupt changes from the hot sun of midday to the chills of evening are found trying by some. The chief edifices are built of stone, the others of adobes or sun-dried bricks covered with tiles. In the great square (Plaza Mayor) stand the quaint cathedral, with its green-tiled dome, the archbishop's palace, the Jesuits' church, the municipal building, and the capitol, built of brick and stucco, with wine-shops on the ground-floor and the two halls of congress on the third story. Other public buildings of the city include the Central University (18th century; reorganised in 1895), a seminary, an observatory, museums, a theatre, libraries, hospitals, a score of churches, and many religious houses. Most of these last are in a very dilapidated condition, though they still retain their lands and revenues; and the offerings of the faithful, who are nearly all Indians, are as constant as ever. One of them (San Francisco) is among the largest in the world. Indeed, Quito is the paradise of priests, and the bells are jangling all day long; for Ecuador has been the most faithful province of the pope, and was the last state in the world to recognise the unity of Italy and the condition of affairs that resulted from the occupation of Rome. The manufactures include cottons, woollens, rugs, carpets, saddles, lace, and beer; the drying of humming bird skins, the copying of religious paintings, and the production of images of the Virgin and of saints rank as important industries. Founded in 1534, Quito has suffered frequently from earthquakes (especially in 1797 and 1854) and from revolutions (as in 1877 and 1883). Pop. about 100,000, mainly Indians and mestizos. See B. Niles, *Casual Wanderings in Ecuador* (1923).

Quit Rent, a term used to denote various nominal rents; properly speaking, a quit rent is a rent reserved in lieu of all services, because on paying it the holder of the land goes quit and free. In old records it is called white rent, because it was paid in silver money, as distinguished from corn rents. The Conveyancing Act, 1881, empowers an owner of land to redeem any quit rent to which it may be subject.

Quoad Sacra. See PARISH.

Quod ubique. See CATHOLIC CHURCH

Quoits, a game still popular in many districts of Great Britain, derived, perhaps, from the ancient game of throwing the *discus*. The *discus* was a circular plate of stone or metal, 10 to 12 inches in diameter, and was held by its farther edge with the right hand, and thrown at an angle of 45°, so as to give it as great a range as possible; the player who threw it farthest was the winner. The modern game of quoits differs very considerably from this. A quoit is a slightly concave ring of iron, generally about 8 inches in external diameter and between 1 and 2 inches in breadth; the weight accordingly varies a good deal, but may in any match be fixed beforehand. The mode of playing is as follows: Two pins, or 'hobs,' are driven into the ground from 18 to 21 yards apart; and the players, who are divided into two parties, stand at one hob, and in regular succession throw their quoits (of which each player has two) as near to the other hob as they can. The points are counted as in bowls or in curling. To facilitate the sticking of the quoits at the point where they strike the ground a flat circle of clay—about 1 or 2 inches in thickness, and 1½ feet in radius—is placed round each hob; this requires to be kept moist. The quoit, when thrown, is given a whirling motion, which causes it to strike the ground with its edge. Players acquire such dexterity in this game that they can very frequently 'ring' their quoit—that is, land it so that the quoit surrounds the hob.

Quorn, or QUORNDON, a village of Leicestershire, $2\frac{1}{2}$ miles SE. of Loughborough, gives name to a celebrated kennel (and hunt) of foxhounds. See FOXHUNTING.

Quorra. See NIGER.

Quorum is a legal term denoting a certain specified number out of a larger number as entitled or bound to act for certain purposes. Thus, in statutes appointing commissioners or trustees of a public work, it is usual to name a certain number of the whole body as sufficient to discharge the business when it may be inconvenient for all to attend. For the origin of the expression, see JUSTICE OF THE PEACE.

Quotidian Fever. See MALARIA.

Quo Warranto, the title of a writ by which a person or corporate body is summoned to show by what warrant a particular franchise or office is claimed. In the reigns of Charles II. and James II the writ was used oppressively, for the purpose of depriving cities and boroughs of their liberties. At the present day an information in the nature of a Quo Warranto may be filed, with the leave of the court; disputed questions in regard to municipal offices, &c., are sometimes brought to trial in this way. The information is now regarded as a form of civil process.

Qurân. See KORAN.

R

the eighteenth letter of our alphabet, descends from the twentieth letter of the ancient Semitic alphabet, named in Hebrew *rēsh*, and in Syriac *rish*. The meaning of the name is probably 'head' (Hebrew *rōsh*, Syriac *rish*, Arabic *rās*). The earliest known form is Δ .

It is curious that most of the early Semitic forms of the letter, including the Hebrew \aleph , have a very close resemblance to the form of D.

The Greeks adopted the letter in the upright form ρ , which occurs in Phœnician inscriptions. With the reversed direction of the writing this became β , afterwards rounded into Φ , whence the P, ϕ , of printed Greek. The Greek name *rhō* is probably to be accounted for by the jingling sequence *ch, o, pi, rhō*, into which the names of this and the three preceding letters were converted in the recitation of the alphabet.

The variety of the Greek alphabet adopted by the Romans had the letter in the form ρ , which was altered into **R** to prevent confusion with P. The Roman **R** was preserved with little alteration in the later varieties of the capital letter; but it is not easily written distinctly on a small scale, and in mediæval minuscule script it assumed a great variety of shapes, all very unlike their original. Our modern *r* descends from a very early type, in which the right-hand part of the letter was reduced to a curl at the top. An English form of the 8th century was *n*, hardly distinguishable from *n* (= *n*). In the Hiberno-Saxon hand the stem was continued below the line, *p*. Other common mediæval forms were *z*, whence our

ordinary script *z*, and *2*, from which descends the form *ſ*, common in English writing in the

17th and early 18th centuries, and still used in German script. In mediæval handwriting the *r* before a vowel was often omitted, the vowel being written above the line, and other abbreviated modes of writing combinations of *r* with other letters were frequent. The sound expressed by the letter has usually been some variety of the voiced point-open consonant, i.e. a voiced sound produced by friction of the breath against the tip of the tongue in contact with the palate. This sound is often trilled, i.e. uttered with vibration of the tip of the tongue. The ancient designation of **R** as *littera cavina* seems to indicate that the Latin *r* was trilled; the trill is normally absent in English, but is common in Scottish pronunciation. In several languages individual speakers substitute for the normal *r* sound another sound of somewhat similar acoustic effect, but very different formation, produced between the back of the tongue and the uvula. This 'uvular *r*', one variety of which is the 'Northumbrian burr', has of late years become the normal pronunciation of *r* in France and in a great part of Germany. A voiceless *r* sound exists in some languages, e.g. in the usual pronunciation of

the French *quatre, ancre*; in Welsh this is now written *rh*. In English the written *r* after a vowel in the same syllable is, in standard pronunciation (though not in some dialects), rendered under certain conditions by a voice-glide, and under other conditions is not sounded; but when final it resumes its consonantal sound before a word beginning with a vowel.

In Bohemian the character *ř* represents a palatal modification of the *r* sound. This was originally the value of the Polish combination *rz*, which is now pronounced *zh* (= *s* in *vision*).

The Roman name of the letter, *er*, is retained in the modern languages, but has become disyllabic in Italian and Spanish (*erre*). The English pronunciation of the name would be expressed in modern orthography by *ar*, the sound of *er* having undergone the same change as in *clerk, sergeant, Hertford*.

Ra. See EGYPT (*Religion*).

Raab (Hung. *Gyor*), a town of Hungary, stands on an extensive plain at the confluence of the Raab and the Little Danube, a branch of the great river of that name, 67 miles WNW. of Budapest. It contains numerous religious edifices, among which is a beautiful cathedral. Pop. 50,000.

Raasay, one of the Inner Hebrides, lies between the Isle of Skye and the mainland of Scotland, and belongs to Inverness-shire. It is 13 miles in length from north to south, 3½ miles in greatest breadth, and 24 sq. m. in area. The western side of the island is bare and uninteresting. On the eastern and more sheltered side there is some striking scenery. Dun Caan (1456 feet) is the highest point, and Brochel Castle, on the east shore—now a mere ruin—the chief object of interest. Iron mines (Upper Lias) were opened in 1911. Pop. 300.

Rabanus Maurus (or more correctly *Irabanus*), a great Carolingian churchman and divine, was born of noble parents at Mainz about 776, and had his education at Fulda and at Tournai under Alcuin, who surnamed him Maurus, after the favourite disciple of St. Benedict. He was next placed at the head of his school at Fulda, where he trained scholars like Walafrid Strabo and Otfrid of Weissenburg. In 822 he became abbot, but resigned in 842 to retire to the neighbouring cloister of Petersberg, whence in 847 he was called to the archbishopric of Mainz. The chief event of his reign was his severity against the too logical monk Gottschalk for his views on predestination. He died in 856. His writings show erudition but little originality. They include Commentaries on the Old Testament, St. Matthew, and St. Paul's Epistles, homilies, doctrinal treatises, hymns, and a Latin-German glossary to the Bible (Graff's *Diutiska*, vol. iii.). Among these are *De Institutione Clericorum*, and *De Universo Libri xxii.*, *sive Etymologicarum Opus*, a kind of encyclopædia of its time.

His *Opera Omnia* (so called) fill vols. cvii.-cxii. of Migne's *Patrologia Cursus Completus*—a reprint of the Cologne edition of Colvenerius (6 vols. folio, 1627), to which are prefixed the *Lives* by his disciple Rudolphus and by Joannes Trithemius. See the studies by Spengler (1856), Köhler (1870), and Richter (1882).

Rabat, or NEW SALLEE, a picturesque seaport of Morocco, is situated on the south side of the Bu-Ragreh, at its entrance into the Atlantic. It stands on cliffs in the midst of gardens, and is overlooked by a large citadel. The most conspicuous object is, however, the tower of Beni-Hassan (180 feet high), rivaling the great towers of Seville (Giralda) and Morocco (Kutubiya); near it is the ruined mosque of Almanzor, originally intended to be made the largest in the world. Ruins still exist of the sultan's palace that was immortalised by the feats of Dick Whittington's cat. Carpets, shoes, and mats are made, and woollens dyed, while the town is the centre of a vine district. Owing to the silting-up of the mouth of the river the commerce of Rabat declined; but imports rose rapidly under the French protectorate, when military railways to Casablanca and Miknas were laid. Formerly it was the centre of the European trade with Morocco. Pop. 31,000, including several thousand Europeans and Jews. See SALLEE.

Rabbath Ammon, or PHILADELPHUS, now AMMAN. See KERAQ, AMMONTES.

Rabbi (Heb., 'my master,' *ḥōdōskale*, John, i. 38), an honorary title of the Palestinian Master of the Law, which is first found applied after the time of Herod, subsequently to the disputes between the two schools of Shammai (q.v.) and Hillel (q.v.). It was in common use at the time of Christ (Matt. xxiii. 7), who is addressed as such by John's disciples (John i. 38) and the common people. Other forms of the same title are *Rab* (Babylonian, 'master'), *Rabbān* (Aramaic), also *Rabbon*, *Ribbōn* ('our master'), and *Rabbour*, *ῥαββουρι*, Mark, x. 51; John, xx. 16 ('my master'). The title *Rabbān* was first given to the grandson of Hillel, Gamaliel I. (q.v.), as prince-president of the sanhedrin, and was borne only by seven other exalted chiefs of schools. *Rabbi* was the usual title applied to the *Tannaim*, or teachers of the *Mishnah*, the compiler of which, R. Judah the Prince (150-210 A.D.) is often called 'Rabbi' alone, without mention of his name. Similarly 'Rab' stands for the Babylonian *Amora* (teacher of the *Gemara*) Abba Arika (175-247 A.D.). According to the famous letter of the *Gaon* Sherira (written in 987 to Jacob b. Nissim and giving an account of Jewish tradition), *Rabbi* is a higher title than *Rab*, *Rabbān* than *Rabbi*, while the simple name is greater than any title at all, i.e. the greatest authorities are the oldest, who lived before the institution of any title. At present nothing but the degree of *Morenni* ('our teacher'), bestowed upon a candidate who proves his erudition in the written and oral law in all its bearings before a college of rabbis, is wanted to render him eligible for the post of a rabbi, which, however, carries no authority whatsoever with it, save on a very few ritual points. No rabbi possesses the power of dispensation. It is a mere ignorant error to hold that the rabbi of our day is a kind of 'priest' in the sense of the Old Testament. He is simply the teacher of the young, delivers sermons, assists at marriages and divorces and the like, and has to decide on some ritual questions. Up to the times of the removal of Jewish disabilities in Europe (see JEWS, vol. vi. p. 337) he had on some occasions also to give judgment in civil matters. In Russia and Poland the Rabbinical Court takes cognisance of civil matters; in London the *Beth Din* regularly, by mutual consent, acts as arbitrator between Jewish litigants, and its findings are upheld by the civil courts. For the later Jewish, or so-called *Rabbinical*, literature, see JEWS, vol. vi. pp. 339 *et seq.*; for Rabbinical Jews and Rabbinites, see the same article, p. 328. For an understanding of Rabbinical methods of

Exegesis, see J. H. Lowe, *Tutorial preparation for Talmud without a Master* (Lond. 1926).

Rabbit (*Lepus cuniculus*), a well-known rodent in the same genus as the hare, from which it differs in some external features and yet more in its habits. The rabbit is smaller than the hare, with shorter head, ears, and legs; the ears are shorter than the head, and have no black patch at their apex, or at most a very small one; the hind-legs are not so much longer than the fore-legs as they are in the hare; the predominant colour is gray. Moreover, the rabbit brings forth blind and naked young, which it nurtures in the safe retreats afforded by the burrows. These burrows are often of great length, have a crooked course, and generally several openings. Rabbits live socially, and prefer for their warrens places where the soil is loose and dry, and where furze or other brushwood affords additional shelter. They feed on grass, herbs, and tender bark. Their reproduction is very prolific, for breeding may occur four to eight times during the year, the period of gestation lasts only thirty days, three to eight young are born at once, and sexual maturity is reached in about six months. A tame rabbit has been known to bear fifty-eight young in a year, and Pennant calculated that from one mother no less than 1,274,840 descendants might result by the end of four years, assuming that all the members of successive generations survived and reproduced. The young are born—naked, blind, and helpless—within the burrow in a special brood-chamber or nest lined by some of the mother's fur. The mother-rabbit takes much care of her young, nor is the male lacking in affection, though in abnormal conditions he sometimes destroys the brood. For periods at least rabbits are monogamous, and the males exhibit much affection for their mates and hatred of rivals. The normal length of life seems to be about seven or eight years. The gregarious life of a rabbit warren needs no description, but it may be noticed that adjacent burrows sometimes intersect. The senses of rabbits are acute, but their intelligence is not highly developed. They are most active in the gloaming and darkness. Their chief enemies are birds of prey such as hawks and owls, and carnivores such as fox and weasel. By stamping with the hind-legs the older rabbits give signals when danger threatens. It is said that the whiteness of the exposed under sides of the tails is of advantage in indicating the direction of movements, but one would think that it must be also disadvantageous in making the retreating rabbit more conspicuous.

Tame rabbits are varieties of the wild form, modified by the artificial selection usually associated with domestication. Among the more important breeds are the 'silver rabbits' with bluish-gray silvery fur, the 'Russian rabbits' with gray body and brown head, the 'Angora rabbits' with short ears and very long silken fur. Albino rabbits with white hair and red eyes are common. The domestic varieties, especially the last, are much less hardy than those which run wild. Some remarkable modifications have occurred among rabbits in which cross-breeding has been prevented by insulation. Thus there are local varieties in the Falkland Islands and in Jamaica. Most remarkable are the dwarf-rabbits of Porto Santo, one of the Madeiras, which are said to be the descendants of a

ingle litter left there in the beginning of the 15th century. That these are so much modified that they do not breed with other rabbits has been asserted, but is now denied.

In regard to the keeping of tame rabbits, it may be noticed that they eat almost any kind of vegetable food; the coarser blades of cabbages, turnip-leaves, celery-tops, carrot-tops, and other produce of the garden, not suitable for human use, are easily consumed by them, as well as chickweed, owl-thistle, dandelion, and many other weeds. When the rabbit-enclosure contains a plot of grass and clover it affords them an important part of their food. Great care is requisite to keep their boxes dry, neglect of which, and a too exclusive feeding with green and succulent food, cause diseases, often fatal, particularly to the young. Dry food, such as corn, ought to be frequently given; and aromatic herbs, such as parsley, thyme, and milfoil, not only tend to preserve the health of rabbits, but to improve the flavour of their flesh. It is usual to give no water to tame rabbits; but it is better to supply them regularly with it, and the females need it after producing young. See books by 'Cuniculus' (1889), Edwards (2d ed. 1887), Knight (1889), Rayson (2d ed. 1889), J. Simpson (1893), and J. E. Harting (1898).

It is believed by many that Spain was the original home of rabbits, and that they were, until comparatively recent times, confined to the Mediterranean region. It is certain that in Spain, and still more in the Balearic Isles, they did tremendous havoc in the 1st century B.C.; still it seems that bones of rabbits have been found in prehistoric deposits north of the Alps. Rabbits spread very rapidly. In some parts of Scotland they were hardly known in the 18th century, though elsewhere they abounded. Their introduction into Ireland is also recent. They are not able to stand great cold, and are therefore absent from Scandinavia and North Russia. The most signal instance of their rapid distribution is to be found in their present abundance in Australia and New Zealand, into the latter of which countries seven rabbits were first turned out near Invercargill, apparently about 1860. As to Australia, the agent-general for New South Wales writes (1891) but 'this department is unable to state the exact date when rabbits were introduced into the colony, but it is certain that they existed about forty years ago.' And according to the *Victorian Year Book* for 1887-88, tame rabbits were kept in Victoria during the early years of the colony (towards the middle of the 19th century); but rabbits were first turned out on an extensive scale by a landed proprietor in the western district. They bred rapidly, and for several years there was a demand for couples for reeling purposes in most districts, nobody guessing what a plague they were to become. In both Australia and New Zealand they have spread and multiplied to an extent which seriously affects the prosperity of farmers and rearers of stock. The climate and soil are suitable and their natural enemies are few. Many endeavours have been made to exterminate them, but without success. Trapping, poisoning, and hunting them down produce only a temporary reduction of numbers. Pasteur proposed to infect them with fowl-cholera, and to some extent this has been tried. It has been lately suggested that only the females should be killed, so that the predominance of males might result in unnatural conditions fatal to continued existence. Most practicable at present is the use of wire netting. Thus, if the pools where the rabbits drink are surrounded with netting, they and die of thirst in a short time. California and Idaho have also suffered severely from the rabbit pest.

Besides eating up crops and pasture, rabbits often do great harm by barking young trees, and also by their burrowing. On the other hand, the white flesh of rabbits forms excellent food, the skin and the fur are much used, and, as Gilbert White noticed, rabbits by their nibbling make 'incomparably the finest turf.' The preserving of rabbits in tins is in some places an important industry. Rabbits are not technically game (see GAME-LAWS). The old English name for the rabbit is *cony*, but the cony of Scripture belongs to the genus *Hyrax*, anatomically a very different animal. See HARE, RODENTS.

RABBIT-SKINS have a regular commercial value in consequence of the hair being well adapted for felting purposes; its chief use is in making the bodies of felt hats and imitations of several of the more valuable furs. See FELT, FURS, HATS.

Rabelais, FRANÇOIS. According to the statements of those who wrote while his tomb was still standing with his name and age upon it, who had access to the church register of Meudon, and who visited the place of his birth while his memory yet lingered, in order to collect every fact that could be found concerning him, this great humorist was born in the year 1483. His father, proprietor of a vineyard called La Devinière, was an apothecary in the town of Chinon, where his house, which afterwards became a *cabaret*, is still shown. François was the youngest of five sons. Of his elder brothers nothing whatever is known. Bishop Huët, annotator of Rabelais, found an old woman of the name in a village near Chinon, and gathered a local tradition that the last male representative of the family, an apothecary, had died at Chinon in great poverty.

At the age of nine the boy was sent to the convent of Senilly, near his father's estate. 'There are some mothers,' he wrote years afterwards, 'who cannot bear to keep their children about the house more than nine, or still oftener, seven years. By only putting a shirt over their frocks and cutting off a little hair from the crown of their heads, and saying certain magical words, they transmute them into birds, i.e. put them into monasteries and make monks of them.' He was, in fact, made a monk at the age of nine, and remained a monk all the best years of his life. One result was that, when he came out again into the world and began to write, he wrote of the world as he remembered it—of Tournaine and the Tourangeaux, the stories and songs of the drinkers, the gossip of the women, the merriment and happiness—the wild, the carelessness, happiness of the whole.

After some time at Senilly, the boy was transferred to the convent of La Baunette, near Angers. Here was a school founded by King René of Anjou in the year 1464, for providing an education on more liberal principles than those of the old method. At this school he founded a life-long friendship with the three illustrious Du Bellay brothers. Nothing is known about the range of his scholarship while at La Baunette. We may, however, very well understand, from the continued protection which Jean du Bellay (afterwards Cardinal) extended to him, that as a young man he had shown promise and proved his abilities. At the close of his course he took the step for which, no doubt, he had been long prepared—i.e. he became a novice of the Franciscan order. It has been asked why he took a step for which he was eminently unfitted; why he became a Franciscan, one of the order which professed to despise learning, and why he exchanged his own smiling country for the barren heaths of La Vendée. The answer seems obvious: for a poor lad the church offered in some form or other, either as priest, monk, or servant of the cathedral or monastery, a livelihood that was certain although humble. It is manifest that the

youngest son of the Chinon apothecary could not expect a certain livelihood, with the power of continuing his studies, in any other occupation. He became a monk and entered the Franciscan convent of Fontenay le Comte simply because this was the convent where some kindly interest found him a place. It must not be supposed that the monasteries were at that or at any period willing to accept any lad who wanted to exchange a life of servitude and hard labour for one of ease. Not at all. Interest was required for the admission of a boy: in some houses he must be of good birth, in others he must have shown abilities beyond the common. Rabelais, in fact, had no choice at all but to become a monk if he could get into some convent, and he entered the house of Fontenay le Comte because it was the only convent which offered to receive him.

By this time the Franciscan contempt of learning had undergone some modification. It does not appear that Rabelais was hindered by the brethren in his studies. On the contrary, he had access to a large and well-furnished library, whether outside the house or in it is not known, and he read all the books that he could get; acquiring Greek, Hebrew, and Arabic; studying all the Latin authors within his reach, French of the 13th and 14th centuries, books of medicine, astronomy, botany, mathematics—everything in the omnivorous fashion of his time, when every scholar with a good memory wished to become a *Doctor Universalis*. He had companions in his ardour for learning, especially one Pierre Amy, a brother-monk. Also, the rules of the Franciscans, far less severe than those of the Cistercians, permitted the monks to go outside the house, and in the little town of Fontenay Rabelais found a friend, André Tiraqueau, lieutenant general of the bailiwick, lawyer, scholar, and writer. Also his early and life-long friend, Geoffroy d'Estissac, Bishop of Maillezais, lived chiefly in his chateau of Ermenud, close to Fontenay.

Many silly stories have been attributed to Rabelais in these years. They all tend to show him in the light of a monkey, mischievous and impish. We may dismiss them as childish; not, however, that we are to regard him—now a priest—as a person grave and serious, charged with the sense of his sacred responsibilities and his vows. Rabelais was at all times a mirthful man, more given to laughter than to tears, and if he did not play silly tricks upon the brethren he certainly laughed at them. We find him corresponding with the great Bude, as one scholar with another. He is on terms of intimacy with Tiraqueau and his brethren learned in the law. He is on terms of friendship with Bishop D'Estissac. Evidently a monk of repute and distinction, he is far above the heads of his nameless and obscure brethren of the monastery. Then we hear of trouble and persecution. The Franciscan jealousy of the old learning has been transformed into jealousy of the new learning. The brothers take their books away from Rabelais and Amy—perhaps lay the pair by the heels in the convent prison.

When they were released a loathing of the convent fell upon these two scholars. What to do? They opened the Book of Oracles—Virgil—and chanced upon the following line:

Heu! fuge crudeles terras, fuge litus avarum!

What could this mean but a direct injunction to escape? They obeyed the oracle and fled—they ran away. Rabelais, returning to the world, was past forty years of age. He seems to have sought the protection of his friend Bishop D'Estissac, by whom he was received. Through him, or perhaps through the kind offices of Cardinal Du Bellay, he obtained the pope's permission to pass from the

Franciscan to the Benedictine order. But he was in no hurry to enter another cloister. He remained at Ligugé with the bishop for six years. It is said that during this period he took a small country living, but this is doubtful. Most likely he passed the whole time in study. Perhaps he paid visits to Paris and Bourges. He made the acquaintance of Marot, who wrote a sonnet for him. His reading had now ceased to be encyclopaedic: its special aims may be inferred from the fact that on the 17th day of September 1530 he entered the university of Montpellier as a student. That he was already known as a scholar is also proved by the fact that two months afterwards he was excused the undergraduate course of three years, was admitted to the Bachelor's degree, and allowed to lecture on Hippocrates and Galen. He dissected publicly before the students, and left the university in the year 1532, returning in 1537 to take the Doctor's degree.

In 1532 Rabelais went to Lyons to get his first book, *Hippocratis et Galeni libri aliquot*, published. He remained there as physician to the hospital. At this time Lyons was as great an intellectual centre as Edinburgh about the beginning of the 16th century. Here the great

Latin Bible of 1550, remarkable for its correctness and for the beauty of its type, and the commentaries of the unfortunate scholar Dolet, in two folios of 1800 columns each, and only eight errata for the whole work. Round this printer was gathered a company of scholars and poets called the *Société Angélique*, a company of broad thought and advanced opinions. As regards religious opinions, it must be remembered that to the scholars of that period the Christian religion meant little more than the Roman ritual and the Roman discipline. They had no idea of Christianity apart from the superstitions they detested. It is not fair to call them atheists: they had adopted the vague but hopeful agnosticism of Cicero: they would not, being scholars, wholly die: they would, after death, be allowed still to watch the advance of learning. Men, for example, who were physicists, like Rabelais, would worship the Creator of the vast and wonderful cosmos. Dolet represents the scholars of Lyons, Despériers the poets, Rabelais the men of science. All three despised and hated the Church of Rome. Two of them felt the heavy hand of the church in life, the third after death. Dolet was strangled and burned at the stake; Despériers, starving and despairing, fell upon his sword; Rabelais, dying peacefully, has been assailed ever since as a buffoon and a reveller in foulness and filth.

It was at Lyons that Rabelais began the famous book, or series of books, by which he will for ever be remembered. In the year 1532 he brought out *The Great and Inestimable Chronicles of the Grand and Enormous Giant Gargantua*. Every Tourangeau knew this good giant. Rabelais had heard about him while a child. It was he who set up the dolmen at Poitiers and the *pierre couverte* of Saumur. When he scraped the mud from his shoes he made hills, which may still be seen. He drank at a ford and swallowed six bullocks, a loaded cart, and the driver. Once he swallowed a ship laden with gunpowder. In fact, Rabelais, who never invented anything, but embellished and adorned everything, did not invent Gargantua. In the sequel or second book, *Pantagruel*, the author departed from his first plan: he no longer wrote pure burlesque; serious ideas are set forth side by side with overwhelming nonsense, and the reader steps from unbridled fancy into regions of sense and wisdom. In order to make the first book correspond with the second, Rabelais

wrote it all over again, with the result that it is fuller of sense and wisdom than the second. Both books had a prodigious success. They were published under the anagram of Aleoifribas Nasier.

At the same time he began his almanac, which he continued for eighteen years. These are all lost except a few fragments.

In 1534 he accompanied his old friend and patron, Cardinal Du Bellay, to Rome. He promised himself great things on this expedition. He would visit the Italian scholars; he would find new plants; he would dig and discover great things; he would study the topography of Rome. In the end he returned with Marliani's book on Rome, which he translated and published with notes of his own.

In 1535 new editions appeared of the *Gargantua* and *Pantagruel*. In 1536 Rabelais again went to Rome. Some of his letters from Italy to his friend Bishop d'Estissac have been preserved. He obtained absolution from the pope for having forgotten to go into a Benedictine house, for neglecting his Hours, and for practising medicine. He also received permission to go into any Benedictine house which would receive him—time being of course taken to find one. He was enabled to hold ecclesiastical offices, to practise medicine without fees, without the knife, and without fire. He now had nothing to fear from his old enemies of Fontenay le Comte. He amused himself in Italy with collecting curious plants—to Rabelais France first, and England next, owes the melon, artichoke, and carnation: he sent seeds to the bishop and bought curiosities for him.

In 1537 he is found in Paris at the great literary banquet held in honour of Dolet's escape from a charge of murder rising out of accidental homicide. From 1537 to 1539 he resided and taught at Montpellier. In the latter year he went to Lyons, where he stayed a short time only, removing to Paris in 1540. Once more he made things right with the church, obtaining absolution for not having found a Benedictine house, and permission to enter the Collegiate Chapter of St Maur des Fossés instead of a convent, and to hold any benefices which might be conferred upon him. In 1543 he was at Symphorien near Lyons—where he witnessed the death of Guillaume du Bellay—at Chinon, Ligngé, and Angers.

During this time he was writing his third book. It was a dangerous time for heretics. A whisper of heresy at the outset might not only ruin the book, but also bring the author to the stake. He caused the first two books to be read to the king, who was so pleased with them that he gave permission for a new edition, and granted a license for the publication of the third. Rabelais did not avail himself of the permission for a new edition. Already many impurities had been pointed out which he declared were due to the printers, interpolations, misreadings, and so forth. Best not to bring out a new edition. But he printed his third book. This was in 1546.

In 1547 the old king died, and a reaction against liberty of thought immediately began. They attacked Rabelais. Not content with finding impurities in the first three books, they printed a thing which they called his fourth book. Rabelais fled: he went to Metz, where he practised medicine. Cardinal Du Bellay, himself suspected of liberal tendencies, withdrew to Rome, whither he called Rabelais. On the birth of King Henry's eldest son great rejoicings were held in Rome. Rabelais wrote an account of these, and sent the little book to the Cardinal De Lorraine, a stroke of policy which enabled him to return, and gave him the living of Mendon.

From both sides, Catholic and Protestant, cries came that his book should be suppressed and the author burned. Nothing, however, was done. But

Rabelais did not dare to proceed further with the fourth book than the eleventh chapter. There it broke short off in 1549. The author, now growing old, lived quietly at his cure of Mendon, preached, catechised the children, and led an exemplary life. Early in 1553, a fortnight before the parliament allowed the sale of the book, he resigned his living and went to Paris. Here, in April of that year, he died. It was in the Rue des Jardins, parish of St Paul. They buried him at the foot of a tree, on which his name was carved. The tree was cut down a hundred years afterwards. Ten years after his death appeared the fifth and last book, which had been left in MS., unfinished and without the author's corrections.

These are the facts which have been gleaned concerning the life of this great humorist. The riotous license of his mirth, which is restrained neither by decency nor by reverence, has made him as many enemies as his wisdom has made him friends. This fault, which Rabelais shares with many writers of his age—our own dramatists were quite as bad—has been made the most of by his enemies. We may grant the blot: yet it is not inherent in the book; it is not woven in the web: and when it is removed there remains the most astonishing treasury of wit, wisdom, common-sense, and satire that the world has ever seen. All, however, assumes the form of allegory: those who have no taste for allegory cannot appreciate Rabelais.

Of the many modern editions of Rabelais may be named that by Ch. Marty-Laveaux (6 vols. 1868-1902). See Urquhart and Motteux's English translation (1653-94, reprinted 1892, 1900, 1921); W. F. Smith's trans. (1893); Sir Walter Besant's *Rabelais* (Blackwood's Foreign series, 1879), and his *Readings in Rabelais* (1881); A. Tilley's *Rabelais* (1907). French monographs include works by Gebhart (1876, 1893); Fleury (1877); Stapfer (1889); Heulhard, *Rabelais: ses Voyages en Italie, son Exil à Metz* (1891); René Millet, *Rabelais ('Grands Ecervains', 1893)*; Bertrand, *Rabelais à Lyon* (1894); Coutaud, *La Pédagogie de Rabelais* (1899); Dr Brémont, *Rabelais Médecin* (3 vols. 1877-1901). In 1903 the *Société des Etudes Rabelaisiennes* began its *Revue*.

Racahout, a farinaceous food prepared from certain acorns. See OAK.

Racalmuto, a town of South Sicily, 13 miles by rail N.E. of Girgenti. Pop. 13,600.

Racconigi, a town of North Italy, 24 miles by rail S. of Turin, with a royal palace built in 1570; the park was laid out in 1755 from designs by Le Notie. Pop. 9000.

Raccoon, or RACCOON (*Procyon*), a genus of the Bear group (Arctoidea), with four premolar and

Raccoon (*Procyon lotor*).

two molar teeth on each jaw; like other Arctoids, it is plantigrade, and has no retractile claws. There

are certainly two, possibly three, but not more than four species of raccoon, which are restricted to the American continent. In North America we meet with the 'coon' (*Procyon lotor*), so called from the habit of soaking its food in water. This animal prefers open woods, and is a good climber, making its home in trees. The raccoons, however, descend to the ground to search for their food, which consists chiefly of aquatic animals, fish, crayfish, and various shellfish; they will also feed upon corn. These animals are among the most strictly nocturnal of mammals; they hibernate during the winter. In South America occurs *P. cancrivorus*, and a well-marked variety which may be a distinct species, and has been named *P. nigripes* on account of its dark-coloured feet. For the Raccoon Dog, see DOG.

Rachel, ÉLISA (properly ÉLISA RACHEL FÉLIX), a great tragic actress, was born of poor itinerant Jewish parents at Mumpf, in the Swiss canton of Aargau, 8th February 1821. At last the family settled at Lyons, and here Rachel and her sister Sarah used to sing for chance gratuities in the streets and cafés. About 1830 the household was transferred to Paris, and here Étienne Choron gave her her first lessons in singing, Saint Aulaire in declamation; but later it was Samson from whom she learned most. Mademoiselle Mars divined her genius, but it was not till Véron and Jules Janin had written glowing criticisms that she took the playgoing world of Paris by storm. She made her first appearance at the Gymnase in the *Vendémiaire* in 1837 with but moderate success, but on 12th June 1838 she appeared as Camille in *Les Horaces* at the Théâtre Français. From this time forward, in the great parts supplied by the classic masterpieces of Corneille, Racine, and Voltaire, she shone without a rival; her fame may be said to have culminated in her appearance as Phèdre in Racine's tragedy in 1843. In *Adrienne Lecouvreur*, a piece expressly written for her by MM. Legouvé and Scribe, she had also immense success, though in other more modern parts her popularity was somewhat less. The *furor* excited in Paris in 1848 by her public recitation of the *Marseillaise* will continue to connect her name with the history of the Revolution. In 1849 she made the tour of the French provinces; before or afterwards she also visited Belgium, London—where Charlotte Brontë saw her—Berlin, and St Petersburg, everywhere meeting with enthusiastic applause. Her health now began to fail; in 1855, in the course of a professional visit to America, it altogether gave way, and she returned utterly prostrated. A residence at Cairo failed to restore her to strength; and on the 3d January 1858 she died at Cagnes, near Toulon. As an artist, within the limits prescribed by her genius, Rachel has probably never been quite equalled. Of the burning intensity which characterised her rendering of passion in its fiercer concentrations no words can give an adequate image. 'She does not act—she suffers,' one observer well said of her. Her Phèdre—by common consent her masterpiece—was an apocalypse of human agony, not to be forgotten by any one who ever witnessed it. In character Rachel was neither exemplary nor altogether amiable. She gave her first love to a Jew, who used her shamefully, publishing her letters after the rupture; in 1844 she bore a son to Count Walewski, himself a son of Napoleon by a Polish mother. In her pro-

fessional relations she was notoriously grasping and avaricious, although she could be royal in her munificence. She lavished her love upon her family, and heaped them with the wealth that she had gained. Her immense popularity enabled her to dictate her own terms to managers without scruple or generosity. She made over four millions and left one and a half million of francs. Her elder sister Sarah (died 1877) failed as an actress, but lived to make a fortune by the sale of the cosmetic 'eau des fées.'

See French studies by J. Janin (1858); D'Heylli (1882, 1902); Mme de Faneigny-Luceigne (1910); V. Thomson (1910); Fleischmann (1910); Mrs Kennard's Life (1885); and Gribble's monograph (1911).

Rachmaninov, SERGEI VASSILIEVICH, Russian pianist and composer, was born in the government of Novgorod in 1873. He had a brilliant career at the St Petersburg and Moscow conservatories, at the latter winning the gold medal for his one-act opera *Aleko* (1892). He began his career as a conductor, but it was as a pianist that he became known at all the principal centres of Europe. In 1909-10 he visited America, and in 1918 settled in New York. The popularity of the 'inevitable' *Prelude* in C sharp minor has unfairly detracted from the worth of his other compositions, which include two one-act operas, *The Miser Knight* and *Francesca da Rimini*, three symphonies, four piano concertos, a symphonic poem *The Island of the Dead*, an Elegiac trio, and different pieces of chamber music, chiefly in the longer forms. Rachmaninov is much the most western of all the Russian composers, not basing his art on popular folk-tunes, nor on exotic Asiatic colours and rhythms, but adhering more to classical idioms and forms. In his case it has led sometimes to a certain coldness and restraint, but there is a big-ness about his work, with its usual far-flung melodic lines, which at times can be singularly dignified and impressive.

Racine, capital of Racine county, Wisconsin, is situated on Lake Michigan, and on both sides of Root River, which is crossed by five swing-bridges, and whose mouth here forms an excellent harbour. By rail the city is 62 miles N. of Chicago and 25 SE. of Milwaukee; steamers ply on the lake to Chicago and the north. Racine contains a handsome post-office and city hall, a hospital, the Taylor Orphan Asylum, and the University of the Northwest (Episcopalian, founded in 1852, and formerly called Racine College). A large trade is carried on in coal and lumber, and, besides flax, flour, and woollen mills, boiler works, and linseed-oil works, there are manufactories of farm implements, pumps, wagons, fanning mills, hardware, wire-work, cordage, furniture, refrigerators, boots and shoes, dairy products, gloves. Sugar beets are grown in the neighbourhood. Pop. 53,000.

Racine, JEAN, the greatest tragic dramatist of France, was born at La Ferté-Milon, in the modern department of Aisne, in December 1639, and was baptised on the 22d of that month. His father was a *procureur* or solicitor by profession, and held, like his father before him, the office of comptroller of salt at La Ferté. His mother died while he was still a child, whereupon his father married again, but soon after died also. The boy was taken care of by his maternal grandfather, and was sent for his education to the college of Beauvais, whence he passed to Port Royal in October 1655, being, indeed, closely connected, both on the father's and mother's side of the family, with the famous abbey. Here he studied hard under the especial care of Claude Lancelot, Nicole, and Le Maître, and at an early age discovered a faculty for verse-making and, still worse, a liking for romance that caused

his good teachers no small uneasiness. He was almost nineteen when he left Port Royal to pursue the course of philosophy at the Collège d'Harcourt, and here he appears to some extent to have exchanged the severity of his Jansenist upbringing for the libertinism of the world of his day, as well as to have first felt the attraction of the life of letters. Naturally his Port Royal friends saw spiritual ruin in his worldliness and his intimacy with the abhorred actors and actresses. Meantime he had written an ode, *La Nymphé de la Seine*, on the marriage of Louis XIV. (for which he received 600 livres), finished one piece and begun another for the theatre, and made the acquaintance of La Fontaine, Chapelain, and other men of letters. About this time he lived a while under the care of his cousin, N. Vitart, fifteen years his senior, and gave him some kind of assistance in his work as financial secretary to the Duc de Luynes. Many letters of this period to Vitart, the Abbé Le Vasseur, and La Fontaine are extant, and show how the lessons of Port Royal were fading into forgetfulness, as his true vocation opened itself up before his eyes. The great dispersion of the *solitaires* of Port Royal took place in 1661, and, from Racine's contemporary letters to the Abbé Le Vasseur, it troubled him but lightly. In November 1661 he went to Uzès in Languedoc, hoping, but in vain, to get a benefice from his maternal uncle, the vicar-general of the diocese, and here he divided his time between St Thomas, Virgil, and Ariosto. Again in Paris before the beginning of 1664, he obtained in August of that year another grant from the king of six hundred livres for a congratulatory ode. But indeed he received almost to the end of his life handsome rewards in money—'gratifications'—from the court. An ode of gratitude to the king for one of these, *La Renommée aux Muses*, gained him the life-long friendship of Boileau, and from about this time began the famous but much over-estimated friendship of 'the four'—Boileau, La Fontaine, Molière, and Racine. Unfortunately from about this point there is a break in his correspondence, so that we lack satisfactory evidence about the most doubtful and, at the same time, interesting points in his career—his singular spite against Molière, his bitter attack upon Port Royal, and his final conversion and retirement from dramatic work. His earliest play, *La Thébaïde* on *Les Frères Ennemis*, was acted by Molière's company at the Palais Royal theatre in June 1664; his second, *Alexandre le Grand*, in December 1665. After the sixth performance the latter was withdrawn explanation represented by the rival actors at the Hôtel de Bourgogne—a fact which of course involved a complete breach of friendship between Molière and himself. This famous quarrel is difficult beyond most to clear up, but there is at least light enough to see that the wrong did not rest with Molière. Racine showed himself as hostile to Corneille, most probably only because the older dramatist judged the younger's work somewhat severely. But he soon plunged into a yet more discreditable quarrel. Stung by one of Nicole's *Lettres Visionnaires* (January 1666) condemning the romance or the dramatic poet as an 'empoisonneur public' in accordance with the ethics of Port Royal, he published a clever and stinging letter to the author, in which he heaped disgrace on his own head by indecent personalities upon Nicole and even his dead teacher Le Maître. Boileau's advice alone saved him from further shaming himself with a second. 'This letter,' said Boileau, 'may do credit to your intellect, but certainly none at all to your heart.' Later in life Racine himself said he would give his heart's blood to wipe out the most disgraceful blot upon his life. His repentance made noble atonement for the

wrong—as for the literary quality of the letters, for brilliant wit and delicate irony they were not unworthy of the hand of Pascal.

During the next thirteen years Racine produced his greatest work, seeking relaxation from labour in at least one liaison with an actress. His plays followed in this order: *Andromaque* (1667), with its charming character Hermione; *Les Plaideurs* (1668), a delightful little comedy of satire against lawyers, which Molière was the first to appreciate; *Britannicus* (1669), which Voltaire styled 'la pièce des connaisseurs'; *Bérénice* (1670), written unconsciously in competition with Corneille, the same theme having been given to both poets by Henrietta of Orleans; *Bajazet* (1672), admirable, but anything rather than oriental; *Mithridate* (1673), produced almost at the moment of his admission to the French Academy; *Iphigénie* (1675), a masterpiece of pathos; and *Phèdre* (1677), a marvellous representation of human agony, which afforded a subject adequate even to the powers of Rachel. With the last ended abruptly his thirteen years of unbroken playwriting. A few days after its production the Trompe du Roi introduced an opposition *Phèdre*, by Pradon, which, though worthless by comparison, was eagerly supported by a powerful party, including the famous Duchess of Bouillon. Whether from disgust and mortification, or from the conversion attributed to him just at this period, Racine turned at once from dramatic work, made his peace with Port Royal, married on June 1, 1677, and settled down to twenty years of domestic happiness. His wife brought him money, if she bore him five daughters and two sons; and he himself had found ample profit in the drama, besides enjoying an annual gratification that grew gradually from 800 to 2000 livres, not to speak of the office of treasurer of France at Moulins, at least one benefice, and from 1677, jointly with Boileau, the office of historiographer-royal of France, with a salary of 4000 livres a year. The last involved the duty of accompanying the king on several of his expeditions, but in the case of both poets bore little historical truth beyond a crop of good intentions and a few fragments. In January 1685 Racine emerged from his retirement to pronounce the discourse at the reception to the Academy of Thomas Corneille, and at last did himself honour by his admirable enlogium upon his greater brother.

In 1689 he wrote *Esther*, in answer to a request from Madame de Maintenon for a play suitable for her girls at Saint Cyr. She had tried *Andromaque*, but found that the girls acted it 'a great deal too well.' Its success was great, but entirely warranted by the exquisite art of the poem. *Athalie* followed in 1691 with much less success, though it perhaps deserved even a greater. Four *cantiques spirituels*, and an admirably written *Histoire abrégée de Port Royal*, make up the whole remainder of Racine's literary work. In his later years he lost the favour of the king—how is not by any means clearly understood. He is said to have prepared a memoir on the miseries of the people, and the king, finding Madame de Maintenon reading this, expressed his displeasure in some harsh words that broke the sensitive heart of the courtier-poet. On 4th March 1698 he wrote a long letter to Madame de Maintenon, to clear himself from the crime of Jansenism, but he never recovered the king's favour, and his acute mortification appears to have hastened his death. He said to Boileau, with the sweet graciousness of his nature, as he embraced him for the last time, 'Je regarde comme un bonheur pour moi de mourir avant vous.' He died 21st April 1699, and was buried by his own desire in Port Royal.

In France it remains an article of patriotism

to claim Racine as the greatest of all masters of tragic pathos, yet this estimate does not very greatly exceed the truth. He took the conventional French tragedy from the stronger hands of Corneille, and added to it all the grace of which it was capable, perfecting exquisitely its versification, and harmoniously subordinating the whole action to the central idea of the one dominant passion. But he was a far greater poet even than a dramatist, and the tender sweetness and beauty of his rhythm, the finished perfection and flexibility of his cadence, and the indefinable yet ever present stamp of distinction that informs his style, combine to add a charm of its kind beyond almost anything else in the whole poetry of France. It may be that the highest poetry of all is beyond his reach, and that his verses are only for a sensitive ear, but such they haunt with a peculiar charm beyond the art of a Lamartine or a Hugo. Within its limits his poetry attains the perfection of the classic in the highest as well as severest sense of the term; it sums up in its content all that was noble in the royalism of the 18th century, and in the spiritual aspirations out of which grew a *Mère Angélique* and a *Pascal*; and it attains the Olympian height of distinct originality as well in the balanced proportion and harmony of all its elements as in the grandeur and sublimity of which it is capable of rising in a *Phèdre*, an *Esther*, and an *Andriette*. These high creations transcend and crown with the glory of completion his habitual tenderness and beauty, but into this empyrean also the poet soars no less naturally on the same strong and steady wing. Voltaire, when asked to write a commentary on Racine, answered, and with truth: 'Il n'y a qu'à mettre au bas de toutes les pages—beau, pathétique, harmonieux, admirable, sublime.'

The first collected edition appeared 1675-76; the last within his life-time in 1697. Of more important editions may be named the splendid folio of 1805, those of La Harpe (with commentary, 1807), Geoffroy (1808), Aimé Martin (1820), A. France (5 vols. 1874), and especially the splendid edition by Paul Mesnard in 'Les Grands Écrivains de la France' (8 vols. 1865-73). The first volume of the last contains a Life; the eighth, a *Lexique* by Marty-Laveaux. Of English translations are the *Disgraced Mother*, by Ambrose Philips (1712), the *Phædra* and *Hippolytus*, by Edmund Smith, brought out at the Haymarket in 1707; and a complete metrical version by R. B. Boswell (1889-91). See vol. vi. of *Sainte-Beuve's Port-Royal*, and vol. i. of *Portraits Littéraires*; books on Corneille and Racine by H. M. Trollope (1881) and Canfield (1904); the monographs by Larroumet (1898) and Lemaitre (1908); and Mary Duclaux, *The Life of Racine* (1925).

Racing. See ATHLETIC SPORTS, HORSE-RACING, ROWING, YACHT.

Rack, an instrument of Torture (q.v.) used for extracting confessions from actual or suspected criminals, consisted of an oblong frame of wood, with a windlass arrangement at each end, to which the sufferer was bound by cords attached to his arms and legs. The unfortunate being was then stretched or pulled till he made confession, or till his limbs were dislocated. The rack was known to the Romans in Cicero's time, and in the 1st and 2d centuries A.D. was applied to the early Christians. According to Coke, it was introduced into England by the Duke of Exeter, Constable of the Tower in 1447, whence it came to be called the 'Duke of Exeter's daughter.' Its use first became common in the time of Henry VIII., but could only take place by warrant of council, or under the sign-manual. Under Elizabeth it was in almost constant use. In 1628, on the murder by Felton of the Duke of Buckingham, it being proposed by Charles I. to put the assassin to the rack, in order that he might discover his accomplices,

the judges resisted the proceeding as contrary to the law of England. In various countries of Europe the rack was much used both by the civil authorities in cases of traitors and conspirators, and by the Inquisition to extort a recantation of heresy. It is no longer in use in any part of the civilised world.

Rackets, or RACQUETS (M.E. *raket*; Span. *raqueta*, 'racket,' 'battle-dore'; Arab. *ráhat*, 'palm of the hand'). No reference is made to the game of rackets before the early part of the 19th century, and the game as then played differed materially from that of the present day. From Dickens's account in *Pickwick* we should gather that the racket-court in which the insolvent debtors disported themselves in the Fleet boasted of more than one wall, but the usual game was played against a single wall, the ball having to rebound into a court marked out with paint. The erection of the courts at Prince's Club in 1853 showed that the four-wall game was coming into favour, and since covered courts have been adopted by the universities and public schools the old game has become practically obsolete. When the site of Prince's Club was invaded by the builder in 1886 the headquarters of rackets were transferred to the Queen's Club, Kensington.

The modern court is about 60 feet long by 30 feet broad and about 40 feet high. It is enclosed by four walls, and covered by a roof with a double row of skylights. The walls and floor are coated with cement, usually coloured black, and marked out by white lines as shown in the plan. A line 9½ feet from the ground painted across the front wall is called the 'service line.' Below this at 2 feet is the 'play line,' which is made of wood, so as to enable the players to judge by the sound whether a ball is 'up' or not. The racket has a small head with tightly strung gut and a long handle. The average weight is 9 oz. The ball is very hard, and 1 inch in diameter. The server strikes the ball alternately from the two serving boxes *a* and *b* in such a manner that it flies direct from his racket to

Plan of Racket Court.

some part of the front wall above the service line, and rebounds into that quarter of the court opposite to him—viz. from *a* into *A*, from *b* into *B*. If the ball hits the wall below the play line, or goes 'out of court,' the server's 'hand is out,' and his opponent has the privilege of serving. If it strikes the wall between the play line and the service line, or falls on some part of the floor other than that indicated, it is a 'fault,' and the server may refuse to take it. Two faults put the hand out. The server must return the service above the play line. The game consists of fifteen aces, and the server scores an ace when the striker out fails to return his service or any ball in the subsequent 'bully.' The variant known as *Squash Rackets* originated at Harrow, and is played on a smaller but similar court, with a shorter racket and a ball of india-rubber. See a book in the 'Badminton' series (1890), one by Eustace Miles (1902), and Weigall, *Squash Rackets*.

Raccoon. See RACCOON.

Racoonda, the fur of the Coyupú (q.v.).

Racow (*Raków*), a Polish village in Kielce county, was in the 16th century a centre of the Socinians, who printed their *Catechism* (q.v.) there.

Radcliffe, a town of south-east Lancashire, on the Irwell, 2½ miles SSW. of Bury and 7 NNW. of Manchester. It has an 11th-century parish church (restored 1873), a ruined tower, a market-hall (1852), a co-operative hall (1878), cotton-mills, bleachfields, dyeworks, paper-mills, chemical and engineering works, and coal-mines. Pop. 25,000.

Radcliffe, ANN, novelist, was born in London, 9th July 1764. Her maiden name was Ward, but at twenty-three she married William Radcliffe, who became proprietor and editor of the weekly *English Chronicle*. In 1789 she published *The Castles of Athlin and Dunbayne*, which was followed by *A Sicilian Romance* (1790), *The Romance of the Forest* (1791), *The Mysteries of Udolpho* (1794), and *The Italian* (1797). From this time she published no more novels—'like an actress in full possession of her applauded powers,' says Scott, 'she chose to retreat from the stage in the full blaze of her fame.' She died 7th February 1823. A sixth romance, *Gaston de Blondeville*, with a metrical tale, 'St Alban's Abbey,' and other poems, and a short life, was published in 1826. As novelist she stands between Horace Walpole and Clara Reeve on the one hand and Sir Walter Scott on the other. She was mistress of every art of awakening the curiosity and enchainning the attention of a reader. And though her figures are shadows without reality, and her pages are unrelieved by humour or wit, she was dear to our great-grandfathers, dearer still to our great-grandmothers. Crabb Robinson preferred her stories to *Waverley*; Miss Rossetti was a warm admirer; and Andrew Lang suggested that the *Sicilian Romance* contains the germ of Byron's *Gianiculus*, of Jane Austen's *Northanger Abbey*, and of Charlotte Brontë's *Jane Eyre*.

See Clara F. McIntyre, *Ann Radcliffe in Relation to her Time* (1921).

Radcliffe, JOHN (1650-1714), born at Wakefield, studied at University College, Oxford, became a fellow of Lincoln, took his M.D. in 1682, and in 1684, removing to London, became the most popular physician of his time. A Jacobite, he yet attended William III. and Mary; from 1713 he was M.P. for Buckingham. He bequeathed his property to the Radcliffe Library, Infirmary, and Observatory, and University College at Oxford, and to Bartholomew's Hospital, London. See a book by J. B. Nias (1918).

Radclyffe. See DERWENTWATER.

Radetzky, JOHANN JOSEPH, COUNT (1766-1858), born at Trzebitz near Tabor in Bohemia, fought against the Turks in 1788-89 and in nearly all the wars between Austrians and French. Commander-in-chief in Lombardy from 1831, in 1848 Field-marshal Radetzky was driven out of Milan by the insurgents, but held Verona and Mantua for the Hapsburgs. Defeated at Goito, he won a victory at Custoza. In March 1849 he almost destroyed the Sardinian army at Novara, forced Venice to surrender, and till 1857 again ruled the Lombardo-Venetian territories with an iron hand.

Radhanpur, chief town of a protected state in Bombay Presidency, India, 150 miles NW. of Baoda; pop. 9900. The state has an area of 1150 sq. m. and a pop. of 68,000.

Radiation, Radiant Energy. See ENERGY, HEAT, LIGHT, RADIUM, RÖNTGEN, VACUUM-TUBES.—Millikan in 1925 proved the existence of radiation of very high frequency seemingly due to nebular sources outside even our universe of stars.

Radie, STEFAN, leader of the Croatian Peasants' Party, contended for federal republican government against the centralised monarchy of Belgrade. Imprisoned more than once, he won all Croatia for his party, which at first refused to attend the Skupstina (1920-22), and later was able to force M. Pašić to compromise. Dr Radie was released in 1925, and his nephew and other members of his party taken into the government, in which he himself took office later as minister of education.

Radical (Chemistry) is a group consisting of two or more elementary atoms which is capable of entering into a series of different compounds without itself undergoing change or decomposition. In this respect a radical resembles an atom of an elementary substance. Radicals are, in a sense, incapable of a separate existence, and must be in combination with other radicals or elements; but two similar radicals can combine with each other, and then the compound produced has been looked upon as the radical in the free state.

Radical, in English politics, is often used to denote the advanced wing of the great Liberal party. The name came into use in the reign of George III. in the phrase 'radical reform.' But modern radicals are descendants of the French Revolutionists of 1789, and began to be called radicals about 1816. Their principal objects have been chiefly concerned with parliamentary reform, the extension of the franchise, the enlargement of the public privileges of the people, and with endeavouring to weaken and curtail the exclusive privileges and prerogatives of the oligarchical ruling classes. The radicals of England were the pioneers of the democratic movement, and sought to achieve their ideals almost exclusively through the agency of parliamentary government. See W. Harris, *History of the Radical Party in Parliament* (1885); S. Bamford, *Life of a Radical* (1842); and the articles CHARTISM, DEMOCRACY, HUNT (HENRY), WHIG.

Radiography. See RÖNTGEN, RADIUM.

Radiolaria, a class of marine Protozoa, represented in all seas, with the living matter divided by a perforated chitinous 'central capsule' into a central mass surrounding the nucleus or nuclei, and an outer vacuolated and somewhat gelatinous zone from which thread-like processes or pseudopodia radiate outwards, never forming a network. The skeleton of the majority is siliceous, either coherent or of loosely disposed spicules; in others it consists of definitely arranged spicules of a protein material called acanthin. A few are without skeleton. Radiolarians multiply by division or by forming spores within the central capsule. Most are minute (under $\frac{1}{16}$ inch); a few form colonies of considerable size, over an inch. The majority form part of the surface Plankton (q.v.); others occur at varying depths or near the bottom (abyssal). Almost all have partner Algae (see SYMBIOSIS). Many of the shells are of extraordinary beauty. Fossilised Radiolarians form deposits of 'Barbados earth' and 'Tripoli powder,' just as modern Radiolarians are forming siliceous ooze on the floor of the deep sea. See Haeckel, *Challenger Report*, xvii, 1887.

Radiometer, an instrument consisting of four horizontal arms of very fine glass, carefully poised so as to revolve easily on a point; the tips of the arms having pith discs blackened on one side. The whole is contained in a glass vessel almost but not quite exhausted of air. When exposed to light or heat the arms move round, more or less swiftly according to the strength of the rays. The blackened sides of the vanes are warmer: the molecules of air striking those sides are more heated by the

vanes: they rebound after impact with greater velocity: the vanes are driven back by a greater recoil on the blackened sides. The radiometer was invented in 1873-76 by Crookes (q.v.).

Radiotelegraph, Radiotelephone. See WIRELESS TELEGRAPH, WIRELESS TELEPHONE.

Radish (*Raphanus*), a genus of plants, of the family Cruciferae, with yellow, red, or purple flowers. The Common Radish (*R. sativus*) has thick, round, tapering, and pointed pods, little longer than their stalks, and has been cultivated from time immemorial in China, Japan, India, and Europe. Some varieties of the Wild Radish found on the Mediterranean coasts resemble so closely the Garden Radish as to suggest that the latter may be but a cultivated race of it. Radish is a well-known salad root, much appreciated for its succulent roots with their warm, pungent taste; the young and tender leaves were also formerly used. The extremely numerous varieties of radish in cultivation are generally classed under the two heads of *Long-rooted* and *Turnip-rooted* Radishes, the roots of the former resembling the carrot in shape, and the latter the turnip. The varieties differ also greatly in colour and size, a red colour generally prevailing. Some of the darker-coloured turnip-rooted radishes, such as the black Spanish, grow to a large size under good cultivation, and are grown in gardens chiefly for their usefulness in winter. Radishes are sown at different seasons, and are generally used when young and small. Radish-juice, mixed with sugar-candy, is a German remedy for hoarseness and cough. The Oil Radish, which has a slender—scarcely fleshy—root, a short much-branched stem, and many-seeded pods, is cultivated in China for the oil of its seeds. To this genus belongs the Jointed Charlock of the cornfields (*R. Raphanistrum*), a troublesome weed, whose seeds may, however, be advantageously crushed for oil. The Sea Radish (*R. maritimus*) is a rarer British species, the roots of which are of fine quality and great pungency.

Radium, the most characteristic of those substances which possess the property of radio-activity—i.e. have the power of producing photographic or electric effects by a process identical with or analogous to radiation. The property was first observed in uranium by Becquerel in 1896—hence the name 'Becquerel rays.' He at first connected it with the property of phosphorescence, in virtue of which a substance continues to emit rays for some time after it has been illuminated by a bright light; but he found that a piece of the double sulphate of uranium and potassium which had not been previously exposed to the light affected a sensitive photographic plate near which it was placed in the dark. In 1898 Schmidt and Madame Curie discovered almost simultaneously that the compounds of thorium had the same radio-active property; and further elaborate investigations on the part of the latter, in conjunction with her husband and Bémont, led to the discovery of polonium and radium as new substances with radio-active properties. The year following, Debierne added to the list by the discovery of actinium. The new field of research opened up by Becquerel and Madame Curie was entered by other experimenters, notably Rutherford, formerly of the University of Manchester, whose previous work at Cambridge in relation to cathode rays and ionisation admirably fitted him for elucidating the complicated phenomena connected with uranium, thorium, and radium. Important work has also been done by Crookes, Ramsay, Soddy, Huggins, and others.

Radium, which is a million-fold more radio-active than uranium, is derived from Pitch-blende (q.v.), in which it exists in very small quantities. It is finally

obtained associated with barium. After a long-continued process of fractional crystallisation it has been prepared in the form of a tolerably pure salt. Its atomic weight is high, 225 according to Madame Curie. The atomic weights of the other radio-active substances are also high, a fact which has an important bearing upon the theory of the process. When compounds of radium are first prepared they become self-luminous, glowing in the dark with a soft light like that of a glow-worm. This luminosity decays gradually in time, and is probably a secondary action due to the impacts of the true radium radiations upon the associated material. Another curious property of the radium salts established by the Curies is their power of giving forth heat apparently indefinitely, without any appreciable change in the substance itself. In other words, radium is able to maintain itself and matter in the immediate vicinity at a temperature a little higher than that of surrounding matter. It is estimated that one gramme of it gives out in one hour an amount of heat capable of raising 100 grammes of water 1° C. This is evidently the result of energetic changes going on in the atom—those changes, in fact, which give rise to the various kinds of radiations and emanations which characterise radium and radium compounds. The radium rays also produce effects on organic matter, and it is possible that certain of these rays may have an influence in destroying malignant tumours.

The most delicate method for studying radio-activity is electrical, depending upon the property the rays have of ionising the air and rendering it a conductor of electricity. When, for example, the rays pass near a gold-leaf electroscope, the electroscope rapidly loses its charge. In this respect the rays are similar to the Röntgen rays. By means of elaborate forms of apparatus made on this principle it has been established that uranium, thorium, and radium give off (at least) three distinct kinds of rays. These have been called the α , β , and γ rays. They differ markedly in their powers of penetrating through aluminium and other substances, the α rays being least penetrating and the γ rays by far the most penetrating. The α rays were examined by Rutherford, and were found to be charged atoms of helium, since under a very powerful magnetic field they are slightly deviated by an amount which proved them to be positively charged particles of mass two or four times the hydrogen atom, projected with a velocity comparable with that of light. Since then Ramsay and Soddy have collected helium thus generated in sufficient quantity to observe its spectrum, and have thus confirmed the anticipation of Rutherford. The β rays are easily deviated in a weak magnetic field, and their deviation is in the opposite direction to that of the α rays. They are thus shown to be negatively charged particles identical with the cathode rays in a vacuum-tube, the mass of each negatively charged particle being about the 1/1850th part of the mass of a hydrogen atom—i.e. they are Corpuscles, or Electrons (q.v.). The γ rays, which are very penetrating, are similar to the Röntgen Rays (q.v.), and do not experience deviation in a magnetic field. They are of the nature of disturbances in the ether akin to light.

Radium and thorium have the power of exciting in neighbouring bodies the same radio-active power, which, however, exists only for a time. This is due to a deposit from a material emanation which has all the properties of a heavy gas. These first emanations diffuse like gases, can be condensed to a solid state at low temperatures (-120° C. to -150° C.), and are themselves fiercely radio-active; wherefore they are short-lived.

These and many other facts suggest that the atoms of radium and the other radio-active sub-

stances are in process of disintegration; and this view, which is probably accepted by most scientific minds, has been elaborated by Rutherford into a fairly consistent theory. The theory is that the radio-activity of radium, thorium, and uranium is accompanied by the continuous production of new kinds of matter which possess temporary activity, and which constitute a whole series of temporary chemical elements, with properties that may be investigated. When the rate of production of each of these kinds of matter balances its rate of decay there is equilibrium, and the process continues at a steady rate.

Radio-activity has been discovered in certain mineral waters and deep wells, and is probably possessed, though in a very minute degree, by substances other than those which are conspicuously radio-active. Thus, freshly fallen snow and freshly fallen rain, when evaporated to dryness, leave a radio-active residue. Also, when a wire is kept negatively charged in air for some time it becomes radio-active. The fact that the phenomenon is strongly marked in substances with high atomic weight indicates a comparative instability in such complex atoms; and the breaking up of complex atoms would seem to mean the final disappearance of the radio-active substances as chemical elements. In their place will be found ultimately the inactive constituents of the emanations, together with argon or helium. But although radio-activity is thus a process of decay or disintegration, it is clear that radio-active substances must somehow be born, as well as die, or they would already be extinct. Uranium is the parent of some of them, and a genealogical tree can be now made out for many of the products. They are elements, in the sense of being able to form salts and of having a characteristic spectrum, but they are short-lived elements—some of them lasting only a few minutes, others a few weeks, and some a thousand years. Those which have a high death-rate and low birth-rate are necessarily rare, on the same principle as is familiar in the population question. It is possible that every kind of matter has some slow rate of decay, but that the commonest substances are the most stable—plentiful because so comparatively stable.

The disintegration of atoms furnishes a new source of heat, which must play a large part in determining the temperature of the earth's crust, and probably also in producing the local elevation of temperature displayed by hot springs and volcanoes. The amount of helium or disintegration-product occluded in a rock of measured radio-activity has been found by the present Lord Rayleigh to furnish an indication of its age, and measurements made by him are now treated as evidence of the age of geological formations. Calculations concerning the earth's age, which had become invalid owing to addition to the data, may thus perhaps be resumed with greater precision.

Radius. See CIRCLE.

Radley, a Berkshire village, near the right bank of the Thames, 5 miles S. of Oxford. The Bowyers' seat here in 1847 converted by Professor W. Sewell into a High Church public school—St Peter's College. It has a fine chapel.

Radnorshire, a border county of South Wales, bounded by the counties of Montgomery, Salop, Hereford, Brecon, and Cardigan. Measuring 36 miles by 30, and 470 sq. m. in area, it is the tenth in size and twelfth in population of all the twelve Welsh counties. The beautiful Wye traces all the south-western and southern boundary, the Teme the north-eastern; and the surface generally is hilly or mountainous, in the Forest of Radnor attaining a maximum altitude of 2163 feet. Of

half a-dozen mineral springs, those of Llandrindod are in most repute. The rocks are mainly Lower Silurian, and the soils poor, less than half of the total area being in tillage. The rearing of stock is the principal industry. Radnorshire returned one member till 1918; thereafter Brecon and Radnor together. Pop. (1801) 19,135; (1841) 25,458; (1881) 23,528; (1921) 23,528. See Williams's *History of Radnorshire* (Tenby, 1858).

Radom, an old but uninteresting town of Poland, on a sub-tributary of the Vistula, 60 miles S. of Warsaw. It is the seat of an active trade. Pop. 61,600.

Radowitz, JOSEPH MARIA VON, Prussian statesman, born 6th February 1797 at Blankenburg, was the son of a nobleman of Hungarian descent, and in 1813 entered the Westphalian army as an officer. After the peace in 1815 he taught in the military school of Cassel; but in 1823 he entered the Prussian service, and in 1830 became chief of the general staff of artillery. By his marriage he became connected with the Prussian aristocracy, and soon became the leader of the anti-revolutionary party. In 1836 Radowitz was sent as Prussian military commissioner to the German Diet at Frankfurt, and held diplomatic posts at Karlsruhe, Darmstadt, and Nassau. He was the confidant and adviser of King Frederick-William IV. in his endeavours to bring about a reform of the German Diet. After the revolution of 1848 the endeavours of Prussia to give a constitution to Germany, by means of the alliance of the three kings, was principally his work. He wrote several works, mainly political, and died 25th December 1853.

Rae, JOHN, Arctic traveller, was born in Orkney in 1813, studied medicine at Edinburgh, and went to Hudson Bay as doctor of the Company's ships. In 1845 he undertook an exploring expedition, and in 1846-47 a more extensive one, wintering in Repulse Bay. He was second under Richardson in 1848 on a Franklin search voyage. In 1853-54 he commanded an expedition that proved King William's Land to be an island. In his various journeys nearly 1800 miles were travelled over for the first time. In 1860 he surveyed a telegraph line to America by the Faeroes and Iceland, and visited Greenland; and in 1864 he made a telegraph survey from Winnipeg across the Rocky Mountains. He died 24th July 1893.

Raeburn, SIR HENRY, R.A., portrait-painter, was born 4th March 1756, at Storkbridge, then a village near Edinburgh, where his father was a manufacturer and mill-owner. His parents died when he was about six years old; and he was educated in George Heriot's Hospital, and apprenticed to James Gilliland, a goldsmith and jeweller in the Parliament Close. While in this employment his turn for art attracted the attention of David Denchar, the etcher and seal-engraver, who gave him some instruction; and he afterwards studied under David Martin, producing at first water-colour miniatures with such success that he was soon able to devote himself exclusively to portraiture in oils. A careful miniature of Denchar, still preserved, forms a curious example of Raeburn's earliest style. At the age of twenty-two he married one of his sisters, Ann Edgar, widow of Count Leslie, a lady of means; and, after practising his art for a time in Edinburgh, he resolved to study in Italy. In passing through London he visited Reynolds, who received him kindly, recognising his talent, and furnished him with introductions to Pompeo Battoni and other leading painters in Rome. After remaining two years in Italy he returned and settled in Edinburgh in 1787, the date of his fine portrait of the second Lord President Dundas. He soon received full employ-

ment as a portrait-painter, and before long attained acknowledged pre-eminence among the artists working in Scotland. In 1812 he was elected president of the Society of Artists in Edinburgh; in 1814 Associate of the Royal Academy, London; and in the following year full Academician. He was knighted by George IV. during that monarch's visit to Scotland in 1822, and was appointed king's limner for Scotland a few days before his death in Edinburgh on the 8th of July 1823.

Raeburn's style was, to some extent, founded upon that of Reynolds. Like Sir Joshua, he aimed at breadth of effect, a result attained by massing together the lights, and keeping them as far as possible distinct from the shadows, and so making each respectively effective; but he attained his aim in a manner and with a feeling that was characteristic and original. He seldom attempted to produce texture and luminosity of effect by thick impasto and semi-transparent painting, but adopted the opposite mode of painting, in a low tone, with a crisp, definite touch, working his colours with little admixture of any unctuous medium. In its decision and power of handling his style has been justly compared to that of Velázquez. In his portraits of men, in particular, the heads are most vigorously modelled, and the characteristic expression is seized in a singularly simple, direct, and effective manner; but works like the seated portrait of his wife and the portraits of the two Misses Grant Suttie sufficiently prove that he could portray the grace and dignity of comely womanhood. His reputation, always high in his native country, is becoming more widely spread, and his works are now much sought after. Among his sitters, who included almost all the celebrated Scotsmen of his day, were Sir Walter Scott, Lord Melville, Sir David Baird, Henry Mackenzie, Neil Gow, Harry Erskine, Dugald Stewart, Principal Robertson, Lord Jeffrey, and Lord Cockburn. Technically, one of his finest is the bust portrait of James Waidrop. His art is well represented in the Scottish National Gallery and National Portrait Gallery, and there are good examples in the National Gallery and National Portrait Gallery, London, in the Glasgow Gallery, and in the Louvre.

See life by his great-grandson, W. R. Andrew (1886); *Sir Henry Raeburn, a Selection from his Portraits* (photogravures, edited by W. E. Henley, 1890); books by Pinnington (1904), J. Greig (1911).

Raemaekers, Louis, Dutch artist and cartoonist, was born at Roermond, Holland, in 1869, the son of a publisher. Educated at Roermond, also at Amsterdam and Brussels, he became director of a drawing school at Wageningen, and achieved some distinction as an artist. During the Great War, horrified by the barbarity of warfare, he issued his famous cartoons, volumes appearing in 1916, 1917, and 1919. Executed with consummate technical skill and full of bitter meaning, these cartoons, or *projets de tableaux* as they have been called, were profoundly influential as anti-German propaganda.

Raff, Joachim, composer, was born at Lachen on the Lake of Zürich on 27th May 1822. He began life as a schoolmaster, but, encouraged by Mendelssohn, he devoted himself to music. From 1850 to 1856 he lived near Liszt in Weimar, then taught music at Wiesbaden until 1877; and from that year until his death, on 24th June 1882, he was director of the Hoch Conservatory at Frankfurt-am-Main. From the time he turned to music down to the end of his life Raff poured forth an incessant stream of musical productions, more than 200 in all. In *Die Wagnerfrage* (1852) and numerous papers contributed to the *Neue Zeitschrift für Musik* he advocated the works and aims of the new German musical school.

Raffaelli, Jean François, realist impressionist painter of Parisian suburban life, born in Paris in 1850, worked in an office, sang bass in the Théâtre Lyrique and in a church choir, studied with Gérôme at the Ecole des Beaux Arts, and travelled in Europe and Algeria.

Raffaello. See RAPHAEL.

Raffia. See RAPHIA.

Raffles, Sir Thomas Stamford, British administrator, was born, a sea-captain's son, off Port Morant in Jamaica, on 5th July 1781. In 1795 he was appointed to a clerkship in the East India House, and in 1805 assistant-secretary to a new establishment at Penang; eventually he was made principal secretary. In 1808 he made a voyage to Malacca, respecting which place, and the East Indies in general, he collected much valuable information. In 1811 Raffles accompanied the expedition against Java (q.v.) as secretary to the governor-general, Lord Minto, who himself took the chief command. The island was captured, and Raffles appointed lieutenant-governor of it and its dependencies. Much had to be done in the way of conciliating the native princes and chiefs to the British rule. He appointed British residents at the native courts, and framed rules and regulations for their conduct. He ordered a general survey to be made of the whole island, and checked the attempt of the native sultan of Jogyakarta to expel the Europeans from Java. His efforts were, however, chiefly directed to effecting a complete reform in the internal administration. By frequent personal interviews with the natives he sought to become acquainted with their manners and character, and to educate them and civilise them; and by them he was regarded with great esteem and affection. But his health had been failing for some time, and in 1816 he returned to England, stopping by the way at St Helena, where he had an interview with Napoleon. On his arrival in England he wrote his *History of Java* (2 vols. 1817). Java having by this time been restored to the Dutch, Sir Stamford Raffles was appointed lieutenant-governor of Bencoolen, a settlement upon the coast of Sumatra, where he landed in March 1818. Shortly afterwards, to paralyse or combat the commercial prosperity of the Dutch in the eastern seas, and to repress the piratical propensities of the Malays, he was sent to form a new settlement at Singapore. In 1824 he was again compelled by ill-health to return to England. But the vessel in which he set sail took fire 50 miles off from Sumatra, and the crew and passengers escaped with difficulty in the boats. By this accident Sir Stamford Raffles lost the greatest part of his effects, including a fine collection of natural history, materials for various East Indian grammars and dictionaries, and for a history of Borneo, Celebes, Singapore, &c. After his arrival in England he lived to carry out what had been one of his favourite projects—namely, the formation of the Zoological Society of London, of which he was named president. He died on 5th July 1826. See *Memoir* by his widow (1830), and the *Lives* by D. C. Boulger (1898), Egerton (1900), Cook (1919), Coupland (1926).

Rafflesia, a remarkable genus of plants belonging to the small family Rafflesiaceae, a family composed entirely of parasitic plants, which consist merely of a flower, and cellular threads in the tissues of the host. The *Rafflesiaceae* are natives of the tropics. The genera include *Pilostyles*, *Cytinus*, *Mitrastemon*, *Bruguaisia*, and others. The genus *Rafflesia* has enormous flowers seated upon the roots of species of *Vitis* and *Tetrastigma*, making their appearance at first as a hemispherical swelling of the bark of the root, and, after the bark has broken, rising up in the form of a head of

cabbage, whilst the perianth is covered with imbricated bracts, which are more or less recurved after it has opened. The perianth is thick, fleshy, and 5-partite. The ovule is inferior, and contains many ovules; and the anthers, which are numerous, are seated under the revolute margin of the top of the style column. After the flower has expanded it diffuses a carrion-like smell, that even attracts

Rafflesia patina.

flies, and induces them to deposit their eggs and pollinate the flowers. The largest and first-discovered species, *R. Arnoldi*, was discovered in 1818 in Sumatra by Dr Arnold, and was sent to the eminent botanist, Robert Brown, by Sir Thomas Stamford Raffles (q.v.). Its flower measures fully 3 feet in diameter, is capable of containing almost 2 gallons of fluid, sometimes weighs 15 pounds, and is the largest of all known flowers. A smaller species, *R. Patma* (on Tetra-stigma), whose flowers are 16 inches to 2 feet in diameter, is highly prized by the Javanese as a medicine, for its strong styptic powers. *R. Horsfieldii*, another Javanese species, is still smaller, its flowers being only 3 inches broad.

Rafn, KARL CHRISTIAN, critic and archaeologist, was born at Brahesborg in Fünen 16th January 1796, and educated at the university of Copenhagen, of which he was appointed sub-librarian in 1821. It is to Rafn's unwearied exertions that Denmark owes the foundation (1825) of the 'Society for Northern Antiquities.' As its secretary he edited and published a great many ancient Scandinavian MSS., occupying about seventy volumes. He was named professor in 1826, and died at Copenhagen 20th October 1864. Among his numerous important works a Danish translation of Norse Mythic and Romantic Sagas (1821-26), and *Antiquitates Americane* (1837), in which he showed that America was discovered by Norsemen in the 10th century (see VINLAND).

Ragatz, a spa of Switzerland, in the south-east corner of the canton of St Gall, by rail 68 miles SE. of Zurich and 13 N. by W. of Chur (Coire); it stands at the mouth of the ravine leading to Pfäfers (q.v.), from which town it gets its healing waters by means of a pipe (1838-40) 2½ miles long. Schelling, the German philosopher, is buried in the parish churchyard.

Ragged Robin. See LYCHNIS.

Ragged Schools. The Ragged School, as distinct from the Certified Industrial School, is a voluntary agency providing education for destitute children, and so preventing them from falling into vagrancy and crime. Vagrant children, and those guilty of slight offences, are provided for in the Certified Industrial School; but the two institutions are frequently combined. John Pounds, a poor shoemaker at Portsmouth, has the honour of

originating the idea of the ragged school. For twenty years, up to the time of his death in 1839, he gathered the ragged children of the district round him as he sat at work. They came freely, and were taught gratuitously. The success attending his humble efforts soon led many more influential friends of the 'outcasts' to engage in the same work. In 1838 London had a Ragged Sunday School, and in 1844 was formed the Ragged School Union, under the presidency of the seventh Earl of Shaftesbury. The first ragged feeding-school was opened in 1841 by Sheriff Watson in Aberdeen, and a similar school in the Vennel, Edinburgh, in 1845 by the Rev. Dr. Robertson. Soon afterwards Dr Guthrie's famous *Plea for Ragged Schools* gave an irresistible impetus to the movement, and caused the author to be generally regarded as the father of ragged schools. A ragged school was founded at the Castle Hill in 1847 (since 1887 at Liberton, the girls' school later at Gilmerton). After this ragged schools were established in almost every town of any importance. Other activities were often connected with them—e.g. penny banks, Sunday schools, shoeblack brigades, even parent meetings. The Education Acts—England, 1870, and Scotland, 1872—introduced the principle of compulsory school attendance; accordingly a large number—especially in England—of such as were merely free day-schools became public schools. Where the system has been efficiently conducted, juvenile crime has sensibly diminished. See REFORMATORY AND INDUSTRIAL SCHOOLS.

Raghuvamśa, the greatest of Kālidāsa's epics, deals with the history of the kings of the line of Raghu, ancestor of Rāma, whose story is told as in the *Rāmāyana* (q.v.) in cantos ix.-xv.; the poem ends in canto xix. abruptly, perhaps owing to the death of the author. It was edited with a Latin translation by A. F. Stenzler (London, 1832) and translated into English by P. de Lacy Johnstone (London, 1902).

Ragi, or KIRAKKAN, a tropical cereal (*Eleusine coracana*). See ELEUSINE.

Raglan, LORD. Fitzroy James Henry Somerset, eighth son of the fifth Duke of Beaufort, was born 30th September 1788. He entered the army in his sixteenth year, and in 1807 served on the staff of the Duke of Wellington in the expedition to Copenhagen. He went to the Peninsula as aide-de-camp to the duke, and in 1812 became his military secretary. As Lord Fitzroy Somerset his name became a household word. He was present at all the great actions of the Peninsular campaign, being among the first to mount the breach at the storming of Badajoz; and it was to him that the governor gave up his sword. On the return of Napoleon from Elba he served under the duke in Flanders, and lost his sword-arm in the crowning victory of Waterloo; and the very next day he was seen pacifying writing with his left hand. He was minister-plenipotentiary at Paris in 1815, and secretary to the embassy there from 1816 to 1819. The duke was appointed in 1819 Master of the Ordnance, and Raglan then became his secretary; and in 1827, when the former became commander-in-chief of the British army, Raglan was called to the Horse Guards as his military secretary. This office he held until the death of his chief in September 1852. He was then made Master-general of the Ordnance, and in October was created a baron. He had sat in the Commons for Truro in the parliaments of 1818 and 1826. He was sent as Commander-in-chief of the English forces to the Crimean 1854 (see CRIMEAN WAR). The desperate infantry battle of Inkermann obtained for Raglan the baton of field-marshal; but, as the campaign proceeded, unfavourable comments began to be made upon

his conduct of the war. During the winter of 1854-55 his soldiers suffered unspeakable privations, and hundreds perished in camp and on board transports for want of the food, clothing, and medicines which were in store, but could not be found in the confusion and mismanagement that prevailed—the fault mainly of the home authorities. The siege continued without much apparent success until June 18, when a general assault was ordered, and when Raglan's troops, as well as the French, received a terrible repulse. Raglan had been suffering from a slight attack of dysentery, and the disaster weighing upon his mind, he suddenly became worse, and died of exhaustion, 28th June 1855. He was a skilful tactician, although it may be doubted whether he had the qualities of a great general. His personal bravery won universal admiration; and his courteous and noble bearing, his gentleness of temper and firmness of mind, and his constant worship of 'duty,' invest his character with something of the chivalrous. See Kinglake, *Invasion of the Crimea* (1863-87); and Hamley, *The War in the Crimea* (1891).

Ragman Rolls (*ragman*, a word of uncertain origin, used in ancient diplomatic language for an indenture or legal deed), the name given to the collections of instruments which record the acts of fealty and homage performed by the Scottish nobility and gentry to Edward I. of England in 1291-92, and afterwards during his progress through Scotland in 1296, and at the parliament at Berwick. The original instruments of homage under the seals of the parties were deposited in the Royal Treasury of England, and have almost entirely perished; but the rolls in the Record Office preserve a record of them. Their contents were given in an abridged form in Prynne's *Records*, and afterwards printed *in extenso* by the Bannatyne Club in 1834. An especial value attaches to the Ragman Rolls as containing the largest and most authentic enumeration extant of the nobility, barons, landholders, and burghesses, as well as of the clergy of Scotland, prior to the 14th century, and the only genuine statistical notices of Scotland of the period.

Ragnarök (*Ger. Gotterdammerung*), the end of the world, when the gods (Odin, Thor, &c.) shall be overcome by their enemies and the world be burned up. See SCANDINAVIAN MYTHOLOGY.

Rags. Fragments of almost all kinds of textile materials have now a commercial value. In the middle of the 19th century all white papers were made of rags, but the great demand for printing-paper for newspapers, &c., necessitated the use of other materials, as esparto, wood-fibre (see PAPER). Linen and cotton rags alone are still, however, used for bank-note and other fine and strong papers, and are mixed with other materials, such as wood-pulp, for inferior kinds. These rags furnish the manufacturer with a material already half made into paper, so to speak, because the preliminary processes of boiling out the silica, &c., from straw or esparto are not required in the case of woven linen or cotton. Hence rags of vegetable fibre will always be valuable for paper-making. Old woollen clothes or shreds of such are called, in the manufacturing districts where they are worked up, 'Old Mungo' (see SHODDY). These rags are torn up, or 'ground up,' as it is termed, and re-manufactured into coarse flannels, &c. Some are actually ground into a sort of powder for flock wall-papers.

Rag-stone, an impure limestone, consisting chiefly of lime and silica, much used in Kent. It breaks up into pieces about the size of a brick, and is hard and flat bedded. The name is also

applied to the hard irregular rock which frequently overlies better building materials. It is used for building purposes, also for making hones or sharpening-stones for scythes, &c.

Ragtime, an American negroid development of syncopation in music, originating late in the 19th century. Ragtimes are generally in quick time, the broken and ragged rhythms, with varying types of syncopation, being emphasised by a liberal use of percussion. Jazz (q.v.) is a later development. Ragtime is usually written in the form of dance music, but Stravinsky and other composers have investigated its possibilities as a branch of serious music.

Ragusa (Slav. *Dubrovnik*), a decayed city of Dalmatia, stands on the east shore of the Adriatic, 100 miles SE. of Spalato and opposite the Gulf of Manfredonia in Italy. It is surrounded with strong walls, and has a very picturesque appearance when seen from the sea. The city seems to have been colonised by refugees from Epidaurum (now Old Ragusa, a few miles to the south-east), Salona, and other Græco-Roman towns destroyed by the Slav invaders of the Balkan peninsula. For some centuries a Roman outpost on the edge of the Slav states, Ragusa flourished greatly under the suzerain protection of Byzantium, but towards the end of the 12th century she was made to acknowledge the supremacy of Venice, though she retained a large share of autonomy. In 1358 Venice ceded her Dalmatian possessions to Hungary, and from that time down to the era of the Napoleonic wars Ragusa generally looked to Hungary (i.e. the German empire) for help against her enemies, although from the beginning of the 15th century she was a free and independent republic. At the same time she became a prominent trading state of the Mediterranean, her prosperity being due to her position between the Christian powers and the empire of the Turks, and the privileges she enjoyed of trading freely with the subjects of the sultan. Her 'argosies' (i.e. 'vessels of Ragusa') traded as far as the Baltic; and a contingent joined the great Armada when it set sail for the invasion of England. Ragusa was the home from the middle of the 15th century of a remarkable literary movement, stimulated by the Renaissance (see SERBIA). In 1805 the French entered the city; this led the Russians to bombard it. In 1808 Napoleon declared the republic of Ragusa to be at an end, and in the following year he incorporated it in the kingdom of Illyria. From 1814 to 1918-19, like the rest of the Dalmatian seaboard, it belonged to Austria. Ragusa, however, had long been declining. The town suffered repeatedly from fires, plagues, and earthquakes, and its harbour, now sanded up, is of little use; as a port it has had to give way to Gravosa, a short distance to the north. Yet Ragusa still contains several striking and interesting buildings, chief amongst them the palace of the rectors (chief-magistrates), built in the Gothic and Classic Renaissance styles between 1435 and 1464; the custom-house and mint, dating from before 1312 and finished in 1520; the Dominican church (1306) and monastery (1348), the former containing a picture by Titian; the Franciscan church and monastery (1317); the church of San Biagio (Blaise), the patron saint of the town, built in 1348-52, but rebuilt in 1715; and the churches of San Salvatore and Alle Dancie. The earthquake of 1667 destroyed the old cathedral, which tradition says was founded by Richard I. of England on his way home from Palestine; its successor (1671-1713) possesses some valuable silver ornaments and curiosities. There is also a large Jesuits' church (1699-1725). The town has a naval college, tanneries, and soap factories, and there is considerable work in drap-

thread, silver, and silver-filigree. It is the centre of a district important for its dates, vines, olives, and cheese. Pop. about 10,000. See Luigi Villari, *The Republic of Ragusa* (1904).

Ragusa, a town in Sicily, 31 miles WSW. of Syracuse, stands on the right bank of the Ragusa, 14 miles from the sea. In the cliffs below the walls and around the town ancient tombs have been excavated. A neighbouring grotto yields stones impregnated with bitumen. Ragusa is supposed to occupy the site of the ancient *Hybla Ileraea*. It consists of two communes—an upper, with 37,204 inhabitants in 1921, and a lower, with 10,801, now called Ragusa Ibla.

Ragwort, the common English name of those species of *Senecio* (q.v.) in which the heads of flowers have a spreading ray, the involucre has small scales at the base, and the leaves are pinnatifid. The British species are large coarse weeds, with erect stem and yellow flowers; one species, the Common Ragwort (*S. Jacobaea*), a perennial, is too plentiful in many pastures. It is refused or disliked by horses, oxen, and sheep. It is the cause of Pictou cattle disease in Nova Scotia, where it is called 'cattle-kill.' To sheep it is injurious but not fatal. It generally disappears from thoroughly drained

Common Ragwort (*Senecio Jacobaea*).

land, at least after a little labour has been expended in grubbing up its roots. The fresh herbage has been used to dye wool green, but the colour is not permanent.

Rahel, the wife of Varnhagen (q.v.) von Ense, a woman of great intellectual abilities and wide intellectual sympathies, might almost be called the foster-mother of German genius. Her name was RAHEL ANTONIE FRIEDERICKA LEVIN; she was a Jewess by birth, a sister of the poet Ludwig Levin (afterwards Robert-Tarnow), and she was born in Berlin on 19th May 1771. The first half of her life was spent in various towns of Germany, in Paris, and in Prague. Her first love having been killed in battle against Napoleon's army, Rahel became a Christian and married (in 1814) Varnhagen von Ense. Her house in Berlin was a gathering-place for men of genius—philosophers, poets, artists, and writers. She herself was greatly influenced when a girl by the writings of W. von Humboldt and F. Schlegel, and especially by Goethe, whom she called her *god*; and she in her turn recognised and encouraged the genius of Jean Paul, Tieck, De la Motte Fouqué, F. von Gentz, Fichte, Hegel, Gans, Heine, Thiers, Benjamin Constant, and others, but especially the writers of the Romantic school. Into the patriotic struggle against Napoleon she threw herself heart and soul. She died in Berlin on 7th March 1833. Her husband published a collection of her writings and letters as *Rahel* (1833), and three years later another collection. See also her correspondence with Veit (1861) and with Varnhagen (1875); and books on her by Schmidt-Weissenfels (1857),

Assing (1877), Mrs Jennings (1876), and Ellen Key (trans. 1913).

Rahere, founder of St Bartholomew's Hospital (q.v.). See *Book of the Foundation* (ed. Moore, E.E.T.S. 1923).

Rahway, a city of New Jersey, manufacturing textiles and chemicals, on the Rahway River, 4 miles from its mouth, and 20 miles W. of New York; pop. 11,000.

Rai Bareil, or RAI BAREILLY, a town of Oudh, India, 48 miles SE. of Lucknow, has a magnificent palace and some fine mosques; pop. 16,000.

Raiffeisen, FRIEDRICH WILHELM (1818-88), born at Hammi, near Coblenz, held various posts in the Prussian government service, but is known as the founder of the agricultural banks on a principle similar to the people's banks of Schulze-Delitzsch (q.v.) now found all over Germany, Austria, Switzerland, and Italy. He wrote several books in exposition of the system. See CO-OPERATION.

Raikes, ROBERT, a pioneer of the Sunday-school movement, was born at Gloucester, 14th September 1735. He succeeded to the business of his father as printer and proprietor of the *Gloucester Journal*, keeping it till 1802. He loved children all his days, and his pity for the misery and ignorance of many in his native city led him about 1780 to start a school where they might be taught to read and to repeat the Catechism. Accounts of the scheme in the columns of his journal attracted attention, the movement grew, and Raikes himself lived to see his schools widely spread over England. He died 5th April 1811, and was buried in the church of St Mary de Crypt, Gloucester, all the children that attended his funeral being given by his directions a shilling and a plum-cake. See Lives by Gregory (1877), Eastman (1880), and Harris (1899).

Rail (*Rallus*), a genus of birds typical of the family Rallidae, represented in Europe by the Water Rail (*Rallus aquaticus*). This is a resident, or, more strictly, a partial migrant in Britain, a shy creature, slow to take wing. Its colours are mostly brown and gray; its length is 11½ inches; its food consists of aquatic plants, worms, slugs, and snails. The nest is made among sedges and grasses near water; there are 7-11 eggs, pale creamy-white, sparsely flecked with reddish-brown and ash-gray; there may be two broods in the season. At the breeding time the birds have

Water-rail (*Rallus aquaticus*).

a loud harsh call. The Corn-crake or Land rail is a near relative, and the Moorhen is also allied. There are several well-known North American species of *Rallus*, such as the King rail and the Clapper-rail. Wallace's Rail (*Habroptila wallacei*), from the Moluccas, and the Weka Raik (*Oedromus*), of New Zealand, have lost the power of flight, and will probably suffer extinction, as has already happened in the case of some of their relatives.

Rails (Railroads) in the wide sense are characterised by compressed bodies well suited for rapid movement in thick vegetation, by colouration adapted for concealment, and by retiring, often crepuscular, habits.

Railways. The addition to tractive power through the diminution of friction to be obtained by the use of rails upon a roadway is so obvious a fact in mechanics that it is not surprising to find records from very early times of the employment of various materials with this object (see TRAMWAYS). Stone or wood was first used, but towards the end of the 18th century the improvements in the production of iron permitted the substitution of that metal on lines laid down in collieries and quarries. The employment of steam-power for locomotion on ordinary roadways was the subject of numerous experiments in various countries during the 18th century, but the credit of producing the first practical working engine is ascribed to Nicolas Joseph Cugnot (1725-1804), a native of Void in Lorraine. His carriage, constructed in 1769 at the French National Arsenal at the cost of the Comte de Saxe, ran on three wheels, and had two single-acting cylinders turning the front wheel. In the United States Oliver Evans (1755-1819) in 1804 constructed a steam dredging-machine which propelled itself on wheels to the river, a distance of $\frac{1}{2}$ mile. The improvements in the steam-engine effected by the inventions of James Watt soon led to better forms of locomotives, and comparatively successful models were produced by William Murdoch; by William Symington of Dumbarton, the pioneer of steam navigation; and later by Richard Trevithick, whose steam-carriage was exhibited in London in 1803. The development of the high-pressure engine was largely due to Trevithick's numerous experiments and inventions. The first railway locomotive was tried, it is said, on the Merthyr tramroad in 1804, but the experiment was not successful, though it is usual to regard Richard Trevithick as the 'father of the locomotive engine.' Otherwise, to the venerable 'Puffing Billy,' patented in 1813 by William Hedley, and now to be seen in South Kensington Museum, must be ascribed the honour of being the progenitor of the enormous stud of iron horses now existing in all quarters of

Fig. 1.—'Puffing Billy.'

the world. In previous experimental lines rack rails and toothed wheels had been provided under the mistaken notion that the adhesion of a smooth wheel to a smooth rail would not be sufficient. 'Puffing Billy,' after many trials and alterations, commenced regular working at the Wylam Colliery, near Newcastle-upon-Tyne, in 1813, and was kept in constant use until 1872, when it was purchased by the government.

A standing difficulty with the earlier forms of engine was the want of adequate and uniform steam-power, various devices being employed to secure the requisite draught to the furnace. The problem was first solved by George Stephenson. In 1815, after many previous experiments made while acting as colliery engineer, it occurred to him that the waste steam might be utilised as a blast to stimulate combustion, and from this idea, with the subsequent invention of the multitubular boiler (by Booth), securing enormously increased heating surface, the present form of locomotive was evolved. Other improvements made by Stephenson comprised the direct communication between the cylinders and the wheels, and joint adhesion of all the wheels by the use of horizontal connecting-rods. An engine constructed by him was the first to run on the Stockton and Darlington line, opened for public traffic on 27th September 1825. The engine weighed about 8 tons, and could make a speed of nearly 16 miles an hour. This engine for many years occupied a stand on the platform of Bank Top Station, Darlington. In 1824 it was shown at the British Empire Exhibition at Wembley, where it attracted great public interest. In 1925 it participated in the railway centenary celebration at Darlington, being propelled by a petrol engine fitted to a duplicate tender provided to enable it to run in the procession. The Stockton and Darlington line was constructed for mineral traffic; and it was not until the opening of the Liverpool and Manchester Railway that the vast possibilities of the new form of transport were proved beyond civil. The directors of that company, with a view to settle the method of traction on the line then approaching completion, offered a £500 prize for the best locomotive engine. Stephenson's 'Rocket,' comprising the improvements above mentioned, was the only one that complied with the conditions laid down, and at the competition which took place at Rainhill in October 1829 its superiority was at once manifest. It drew a coach with thirty passengers along the prescribed course at the rate

Fig. 2.—The 'Rocket.'

of 30 miles an hour. The 'Rocket' went into regular service on the opening of the railway in the following year. It weighed, with its supply of water, only $4\frac{1}{2}$ tons, and long after it had been superseded by heavier engines, on one occasion is said to have run 4 miles in $4\frac{1}{2}$ minutes. It was later used on the Bampton Railway in Cumberland, but has for many years occupied a stand in the

South Kensington Museum. All the many changes which have since been effected in the appearance and size of the locomotive have been more matters of detail than of principle. The 120-ton express passenger-engine, which runs at a speed of a mile per minute for miles together, does not differ materially in principle from George Stephenson's pioneer engines.

Dimensions have, of course, vastly increased, steam pressures then undreamt of are systematically used, and availability of high grades of steel has solved many constructional and operating problems, while substantially new systems of boiler, valve gear and motion design have superseded the early low-pressure non-expansion, relatively elementary and comparatively crude methods. Of later origin are the principles of compounding, applied in various ways, and still favoured to some extent, and for particular classes of engines; and super-heating, which has become a characteristic of practically all modern locomotives. Mechanical and other lubricators, feedwater heating, special forms of valve gear, and various appliances and fittings are now in extensive if not general use. In essentials, however, the 'Rocket' included the features of successful locomotive design, though developed almost out of recognition.

Considerable diversity has hitherto existed in the type of locomotive on various lines; but the policy now adopted by nearly all the leading companies of manufacturing their own rolling stock, and the obvious advantage of having interchangeable parts, has led of late to the gradual adoption of a more uniform style of construction for the different kinds of service required. As a general rule inside cylinders are in use in the British Isles, though many modern engines have them outside (three and four-cylinder engines necessarily have both inside and outside cylinders), and this is now almost invariably the case in foreign practice.

At one time the four-wheeled bogie was regarded as practically characteristic of American locomotives. Now, however, practically all express passenger locomotives have leading bogies, and this applies also to many mixed-traffic and express goods engines, though some of these have a two-wheeled 'pony' or 'bogie' truck instead. The ordinary six-coupled goods engines, together with some of the powerful eight-coupled mineral engines, still have, on most lines, only the coupled wheels, though there are many of the large classes with a two-wheeled truck leading the coupled wheels.

British railways have adhered systematically to the plate frame, and this applies generally in other countries except where the American bar-frame is used, and that, as a rule, in connection chiefly with American-built locomotives. Many railways still use the ordinary round-topped firebox, sometimes in combination with a wide grate of the Wootton type, as on the Great Northern section of the London and North Eastern Railway. The Belpaire firebox (flat-roofed, and more or less square) is, however, extensively employed, as it possesses many advantages, particularly in regard to staging and the provision of generous steam space above the crown of the firebox. Oil fuel is extensively used in the oil districts, and has gone ahead in countries where coal is expensive and has to be brought overseas. Otherwise, however, coal is still the general fuel for locomotives.

For purposes of easy reference engines are regarded as having wheels of three classes—leading (carrying), coupled (driving), and trailing (carrying). The number of each is given thus (a cipher indicates the absence of wheels of a particular class): 4-4-2, 0-6-2, 2-8-0, 0-6-0, &c. Special engines having two (or more) sets of coupled wheels necessarily require the middle figure (for coupled or driving

wheels) to be duplicated, while some special designs require six figures (carrying, coupled, carrying, carrying, coupled, carrying) to denote the arrangement.

The usual wheel types (frequently with long large diameter boilers) for express passenger traffic are those known as the 4-6-2 ('Pacific'), 4-6-0, 4-4-2 ('Atlantic'), and 4-4-0, with some instances of the 4-8-2 ('Mountain'), and 2-6-0, 2-6-2, 2-8-0, 2-8-2 and other types for mixed traffic or steep-gradient duty. In the mountains there are some instances of the use of ten-coupled and even twelve-coupled locomotives.

For goods and mineral service the usual types are 0-6-0, 2-6-0, 4-6-0, 0-8-0, 2-8-0, 2-8-2, and a few 0-10-0, 2-10-0 ('Decapod'), and 2-10-2 ('Santa Fe') engines. During recent years a large number of special types have been introduced, having two, or even three sets of coupled wheels, one or both sets being in pivotal relation to the engine as a whole. Some of these engines are compound, particularly the Mallet class, steam being used first in one set of cylinders and then in the other. These special types may be briefly classified thus:

Fairlie.—Two sets of coupled wheels in pivoted frames, one double boiler or two separate boilers in one frame. Usual types, 0-4-4-0 and 0-6-6-0.

Meyer and Mallet.—One boiler, rear set of coupled wheels in main frame, and leading set in frame connected to rear frame by hinged connection. In the Mallet type the rear cylinders use boiler steam, and the leading cylinders low-pressure steam from the rear set. Usual types, 0-4-4-0, 2-4-4-2, 0-6-6-0, 2-6-6-2, 0-8-8-0, 2-8-8-2, and 2-10-10-2. Also one of two special adaptations including three sets of coupled wheels extending under the tender, 2-8-8-8-2.

Garrett.—Two engine bogies carrying the main frame between them, so that the boiler is, as it were, slung between the pivots and is not restricted in dimensions by wheels and axles below it. Usual types, 0-4-4-0, 2-4-4-2, 2-6-6-2, and special forms, 4-4-2-2-4-4, 2-6-2-2-6-2, &c., together with a few eight-coupled classes.

Kitson-Meyer.—An adaptation of the Meyer type above mentioned, with features introduced by Kitson & Co., Ltd., of Leeds.

These and other attempts to combine a large number of coupled wheels in an engine of limited size, or of well-distributed weight, and, at the same time, to obtain flexibility of wheelbase, are now extensively employed abroad, though there is little need for them in the British Isles (one or two classes are, however, in service or under construction), and, particularly in the United States, engines of tremendous size and power have been placed in service, in recent years, of these special types. 'Articulated' designs, as they are generally classified, are adapted in both tender and tank engine forms.

So far as tank engines are concerned, general use is made of them in the British Isles, and many interesting classes have been placed in service, some being intended for working express trains for runs of moderate length. The usual types now in use are: 0-4-4, 0-6-0, 2-4-2, 0-6-2, 0-6-4, 4-4-4, 4-6-2, 4-6-4, 0-8-0, 2-8-0, 0-8-2, and occasional instances of the 0-8-4 and 4-8-0, and (abroad) some with ten-coupled wheels. Some of these engines are actually adaptations of main line tender designs in tank engine form, and in some cases three and four cylinders are fitted.

With the development of electric traction numerous types of electric locomotives have been introduced, some of them including mechanical features derived from steam locomotive practice. On 'tube' and electrified suburban lines, however, the trains are usually made up of electric motor

and trailer cars, separate locomotives being used only (if at all) for working trains consisting of ordinary vehicles, so that they can be hauled on other stages by steam locomotives. In London, Paris, Berlin, New York, and, more recently, Madrid there are now systems of 'underground' or 'tube' lines all operated electrically, while the New York, Boston, and Chicago 'elevated' railways, and the Liverpool Overhead Railway, also many suburban lines in the vicinity of large cities, are now operated electrically. Electricity is now also often utilised for rack railways.

This type of railway has been adopted with advantage for the working of lines having steep grades. The Mont Cenis (1865) and Rigi Railway (1871) in Switzerland are among the best-known instances of this form of construction. The Zernatt Railway, 22 miles in length, opened in 1891, is a good example of 'combined' working, though many other, and in some respects more notable, lines of this kind have since been opened, especially in South America. A similar line ascends Pike's Peak in Colorado to a height of 14,134 feet. The highest points reached by the locomotive are Galera, a village in Peru, 15,635 feet, and those touched by a line from Galera rising 215 feet higher. The railway crossing the Andes in South America, from Buenos Aires to Valparaiso, is worked on this system for some 17 miles.

The Lartigue system of light railways, of which several short lines were constructed—one in Ireland (now dismantled) and others in France—comprises only a single rail. The carriages or receptacles for goods are balanced on either side, punnier fashion, on a pyramidal structure of wood or iron, 3 or 4 feet in height, which carries the rail. A 'bicycle' railway was proposed, and an experimental line constructed in the United States, the engine and carriages being retained on the single rail by an overhead support held between small horizontal wheels. Other forms of railway include the German suspended line from Barmen to Elberfeld, a distance of 9 miles, the Behr mono-rail sanctioned but not constructed between Liverpool and Manchester, and the Brennan patent, in which equilibrium on a single rail is maintained by a high-speed gyrostat.

Carriages.—The builders of the earliest railways did not intend them for passenger so much as for goods traffic. On the Stockton and Darlington line ordinary coaches placed on suitable wheels were used for the small passenger business which was encouraged, and for many years the coach was the model for railway-carriage builders. Third-class passengers were accommodated in open wagons, with or without seats. So late as 1845 many of these vehicles had no windows, light and ventilation being provided by Venetian blinds. On several of the lines no lamps were supplied in third-class carriages even for the night journeys. The first-class passengers booked their tickets as in coaching days, and their luggage was packed on the roof of the carriage to which they were allotted. As the passenger traffic increased the public became more exacting in their demands, and gradually more attention was given to the comfort of travellers, and the tendency of modern management is to add to the luxuriosity of the carriages, especially in long-distance trains. On account of the gradual decrease of second-class passengers practically all railways have now abolished that class. Carriages for first and third-class in most express trains are now fitted with lavatories and every comfort for both classes. Drawing-room, luncheon, and dining-cars are also provided for day expresses; and sleeping-cars for night trains are fitted with all the luxury of a first-class hotel.

British Railway Statistics.—At the end of 1925 the railways of Great Britain had a route mileage

of 20,392 miles, of which over 11,000 miles were laid with at least two tracks. Including sidings, this represented a total track mileage of 52,231. For operating traffic there were 24,166 steam locomotives, 42 electric locomotives, 6 petrol locomotives, together with 133 locomotives for departmental and other purposes. There were 47,532 passenger-carrying vehicles normally worked by steam power, 2061 electric cars, 103 rail motor vehicles, and 21,585 other coaching vehicles, making a total of 72,823. For merchandise and mineral traffic, a total stock of 721,359 vehicles was available, with, in addition, 53,137 allocated for railway service purposes. In the same year the railways had 303 motor and 38 horse-drawn road vehicles for passenger traffic, and 2282 motor, 31,662 horse-drawn, and 70 miscellaneous road vehicles for parcels and goods traffic.

Brakes.—The supply of brake-power has been the subject of many ingenious patents, and is dealt with in a separate article in this work. The use of continuous brakes of some approved form on all passenger-trains in the United Kingdom was made compulsory by the Railway Regulations Act of 1889. See the article BRAKES.

Railway Construction.—The cost of constructing railways is dependent on many conditions, such as cost of labour, the nature of the district traversed, and value of the land required. In England the last-named item has been a very serious one, and heavy parliamentary expenses have also added largely to the cost per mile, which, including equipment, has averaged over £50,000 for the United Kingdom. The most expensive railway system in the world is the underground system known as the 'Inner Circle' line of London. A circular railway of this description was recommended by a parliamentary committee in 1864. The scheme was carried out by two companies, the Metropolitan and the Metropolitan District, which have since extended their respective systems into the suburbs. This circle, including the purchase of land, which was the heaviest item, cost from £600,000 to nearly £1,000,000 per mile. The Metropolitan line from Bishop's Road to Farringdon Street was opened on 10th January 1863, but the circle, owing to financial and other difficulties, was not completed until October 1884. Another very costly section of railway is that of the Southern system between Charing Cross and Cannon Street, London, which includes two large stations with hotels and two bridges over the Thames in its length of two miles. The cost of this short piece of line was over £1,000,000 per mile. Some of the recently constructed 'tube' and other lines, especially those built since the Great War, have involved expenditure on a very large scale. In other countries the land acquired has been of much less value, and in many cases has been given by the government. Moreover, the traffic has not been so heavy, and consequently lighter works have sufficed than those which the Ministry of Transport requires in Great Britain. The average cost of railways in the United States is thus under £12,000 per mile, and in Western Australia the railways have been built and equipped at about £4400 per mile. In flat tracts, such as the prairies, where the traffic is light, the rails can be laid with but little prepared roadway; but this is an exceptionally favourable condition, engineers in most cases having to span rivers (see BRIDGES), pierce hills or mountains (see TUNNELS), cut through elevations, and carry the line over low-lying ground on embankments. The roadway having been completed, a substantial bedding of gravel, burned clay, or other suitable material is laid, and in this are imbedded the 'sleepers,' to which the rails are fixed. In laying out a line it is of great importance that heavy gradients and

sharp curves should be avoided, as the former add to the cost of working and the latter interfere with speed. Some of the sharpest railway curves in the United Kingdom are on the narrow gauge Festiniog line, where there are curves as sharp as the sweep of Oxford Circus—of but 116 feet radius—for short lengths. This line runs to a point 700 feet above Portmadoc in less than 12 miles, giving an average gradient of one in 92, and a maximum gradient of one in 80. On the Sleaford and Bourne section of the London and North Eastern Railway the line, on the other hand, is practically level, the gradients averaging about one in 400. Before the Ministry of Transport will sanction the opening of a line it has to be satisfied as to the strength of the bridges, that a minimum distance of 6 feet has been left between the lines, and as to other conditions.

The form of 'permanent way' has altered considerably since the laying of the first railways. The first wrought-iron rails used on the Stockton and Darlington weighed 28 lb. to the yard. The cheapening of steel which followed the invention of the Bessemer process has led to the use of that material for rails throughout the world, and the size of the rails has been successively increased until between 85 and 100 lb. per yard is the usual weight. In British railway practice the rails are supported in cast-iron chairs held by wooden wedges, and the chairs are spiked on to transverse wooden sleepers. On American and colonial lines chairs are dispensed with, and the rails are spiked direct on to the sleepers. The joints are made by 'fish plates' bolted on each side of the rails, and the bolt-holes are made oblong or elliptical to permit of the expansion and contraction of road under changing temperatures. Blocks of stone were sometimes used in the early history of railways to support the metals, but the rigidity obtained was found to be very destructive of rolling-stock, and wooden sleepers lying on gravel ballast are now almost universally employed. Iron sleepers have been found serviceable in some countries where wood is liable to the attacks of insects.

Light Railways.—In order to benefit the agricultural and other interests in districts too poor to make or support a railway on the usual terms, the Light Railway Act was passed in 1896 to empower the construction of lines of cheaper construction and simpler working than the ordinary. To avoid the heavy parliamentary expenses, the bill gave power to a Light Railway Commission (now dealt with by the Ministry of Transport) to make inquiry, and, if it were satisfied, to issue orders (subject to the approval of the Board of Trade) for the construction of such railway. County, Borough, and District Councils were empowered to initiate such railways, or to advance part of the necessary capital, and the Treasury could also advance a like sum at $\frac{3}{4}$ per cent. not exceeding one-fourth of the whole capital. About 750 applications have been received by the commission.

Signals.—At a very early stage of railway working a system of signals was found to be necessary. In 1830, when the Liverpool and Manchester line was opened, a flag by day and lamp by night were adopted; but this soon proved inadequate for the traffic, and in 1837 the managers of the Grand Junction Railway erected poles about 12 feet in height, with discs and lamps turned through a quarter circle by the pointsman working a lever at the base. About 1842 a semaphore signal, somewhat similar to those now in use, was introduced. Up to 1846 there were no 'distant' signals, but in that year this extra precaution was adopted. The successful concentration and interlocking of the levers working both points and signals was effected in 1856 at the Bricklayers' Arms Junction, and

in 1859 the first interlocking frame was fixed at Willesden Junction. Since that date the interlocking and concentration of signal and point levers has made rapid progress. The signals now in use may be classified as 'home,' 'distant,' 'starting,' 'advanced starting,' and 'disc,' the last named used on goods sidings. By the interlocking of points and signals, if the signalman has, for instance, moved a lever that opens a pair of points to enable a train to come out of a siding on to the main line, the 'home' and 'distant' signals must be at 'danger' to stop any train from approaching on the main line, and it is impossible for him to lower them.

During recent years pneumatic, electro pneumatic, and all-electric signalling have been extensively introduced, and on many of the 'intense' traffic suburban and practically all underground and 'tube' lines automatic signalling is employed. In many instances the signals are entirely of 'light' type, in that shaded red and green lights are shown without a moving semaphore arm being employed at all. Similar light signals, but of greater power, intended for use also under daylight conditions, are used to some extent, and are known as daylight colour light signals. Such signals consist merely of combinations of red, green, and yellow lights in one casing, the respective colours being switched on or off as required, or more usually by the automatic signalling equipment, according to the presence or absence of trains in their respective sections. On some lines in Great Britain, and to a large extent in the United States, 'upper quadrant' signals are now used, these working upwardly instead of downwardly. Frequently, too, three-position methods are adopted, in that the arm is horizontal (red light) for 'stop,' inclined upwardly at 45° (yellow light) for 'caution,' and pointing vertically upwards (green light) for 'all clear.' The same principle applies to light signals utilising the three colours, yellow having been adopted in many cases for the 'caution' indication. In some instances the 'caution' indication and the yellow light are used for 'repeating' the next signal ahead, and not necessarily as an actual equivalent to a true 'distant,' which implies that the line is clear throughout the whole of the section ahead, and possibly past the complete series of 'stop' signals under the control of a particular signal box. A system wherein a 'double yellow' indication precedes a single yellow, thus combining to some extent the 'distant' and the 'repeater,' is now in use on parts of the Southern Railway.

In the working of a railway the telegraph plays a very important part. By its means trains are started and protected throughout their journey; the signalmen are placed in communication with each other, and are warned if the signals are not acting properly. Before the introduction of telegraphy, signals were placed at certain points, and kept fixed at 'danger' for a certain time before another train was allowed to pass. In 1853, however, the absolute block telegraph system was introduced, and was made imperative on all railways by the act of 1889. Under the absolute block there can be only one train in a given section at the same time, while under the 'permissive' system there may be more than one train in each section. Taking A and B as the stations at each end of the section, the working of the absolute block system is thus arranged: the signalman at station A gives to station B what is called the 'Be Ready' signal, which indicates the nature of the approaching train. The man at station B, if the previous train has passed his cabin, and he knows that the section between A and B is clear, repeats this signal to the next box. The train is then

despatched from A, the signalman at that box giving the warning 'Train on Line,' which the man at B acknowledges, and at once gives the 'Be Ready' signal to C, and so on. As soon as the train has passed B, the man in that box telegraphs 'Line clear' to A, who acknowledges the message. Practically all running lines on double track sections in the United Kingdom are now controlled by block-working. On many single lines the 'train-staff and ticket' system is adopted. In this case, supposing there are two trains at one end of a line or section to proceed to the other end, the first would start with a ticket, the second carrying a staff which is the only key for the box in which the tickets are placed. No train is allowed to enter the opposite end of a section until the train staff arrives, so that it is impossible for two trains to meet.

On all busy single lines electric train tablet or train staff apparatus is now employed. The principle is the same in each case, though the apparatus differs. At each end of a section is a tablet or staff instrument, and, when required, a staff or tablet can be obtained from either, providing that no other tablet or staff is already in use. As a tablet or staff can be replaced in either instrument, it follows that, so long as one has not already been withdrawn, it is possible to send trains in either direction through the section as required. This system overcomes certain drawbacks of the ordinary train staff (and ticket) system, while the issue of tablets or staffs is governed by the instrument. Where fast trains are systematically run, it is now usual to provide apparatus on the engines and alongside the track, so that the pouches used for containing the tablets, or the train staffs themselves, by means of a ring attached thereto, can be exchanged at speed. Obviously, it is always necessary for drivers to ascertain, on receiving a tablet or staff, that it is the correct one for the section they are entering. Failure to do so has accounted for one or two accidents; otherwise, single lines are probably as safe as, if not safer than, double lines in regard to accidents arising out of signalling.

Mechanical details of signalling have on occasions to be superseded by manual work. In case of fogs a man, generally one of the platelayers, is stationed at the foot of each 'distant' signal, and as the semaphore is raised to 'danger' he places on the rails two detonating signals, which are exploded by the engine as it passes over them. If the engine driver hears no explosion he knows the line is clear. Fog signalling machines are now frequently installed, by which a fogman is able to place detonators on the rail without having to go on to the track himself. By this means one man is often able to fog-signals several lines. Similar repeating signals are usually placed adjacent to fog-signalsmen's huts to inform them as to the indications of the signals they are looking after. On some lines fog-lights are now used, consisting of powerful electric lights repeating the indications of the signals to which they apply. They are placed at a level which can be conveniently seen by drivers (or motormen on electric railways), and have enabled fogmen to be dispensed with altogether on some of the busy suburban lines. These fog-lights are, of course, switched in only when weather conditions call for them.

Gauge.—In deciding upon the gauge to be adopted the constructors of the first railways naturally adopted that of the tramroads then in existence—viz. 4 feet 8½ inches, that standard having been fixed upon as being in common use for the ordinary vehicles of the country. On all the lines built by George Stephenson, and most of the other leading engineers in the United Kingdom, this 4

feet 8½ inches gauge was adopted; but in 1838 Brunel, in his desire to secure double the attained speed and capacity of the then constructed railways, determined upon a 7-foot gauge for the Great Western Railway. This brought about the now historic battle of the broad and narrow gauges. The Eastern Counties (the late Great Eastern), opened for traffic in 1843, had a 5-foot way, the Caledonian 5 feet 6 inches, and in Ireland there were 5 feet 2 inches and 6-foot gauges. So long as lines of different gauges serving separate districts did not come into contact the inconvenience of breaks of gauge were not felt, but when the broad and narrow gauges met at Gloucester in 1845, and at other points later on, the evil effects were soon felt. Goods and passengers had to be transferred from the one set of carriages to the other, and no through services were possible until at a later period the Great Western laid a third rail to accommodate the narrow-gauge trains. So serious became the difficulties which arose through the breaks of gauge that in 1845 a commission was appointed; it reported in favour of the narrow gauge, and in August 1846 an act was passed enacting that thereafter it should not be lawful to construct any railway for the conveyance of passengers on any gauge other than 4 feet 8½ inches for Great Britain and 5 feet 3 inches for Ireland. It was, however, provided that railways constructed before the passing of the act on any other gauge should be allowed to maintain their independence. The Great Western, therefore, continued to maintain its broad gauge until its final disappearance on 20th May 1892. Parliamentary sanction has, however, been given to various exceptionally narrow gauge lines. In most European countries the gauge adopted has been about the same as the British standard. In Spain, however, the gauge is 5 feet 3½ inches, and in Russia, for military reasons, 5 feet was adopted. In India and on the South American systems 5 feet 6 inches is the gauge. The Australian states have varying gauges, and 3 feet 6 inches is the prevailing gauge in South Africa.

According to the Ministry of Transport report for 1924, 24 passengers only were killed, and 502 injured, in accidents to trains on the railways of Great Britain. Of the servants of railway companies, 225 were killed, either in accidents to trains or (the larger proportion) due to the movement of railway vehicles, while those injured totalled 3886. In addition, 3 contractors' servants were killed and 17 injured. Seeing that the total estimated number of passenger journeys made was, approximately, 1,744,000,000, the proportion of deaths arising from railway accidents, in the case of passengers, was one in about 73,000,000, and, of injured, one in about 3,400,000.

Speed.—Many old records of notable speed performances could be referred to, but it will be sufficient to consider only some of the more outstanding instances on record and to pay some attention to the work normally demanded of express passenger engines. Many claims for exceptional speed have been made on behalf of United States railways. It is doubtful, however, whether these can be accepted as entirely beyond question, but there are several records on British railways which were so carefully compiled as to be generally accepted as proved. The most remarkable run was one made in 1904, when a Great Western engine touched a speed of 102 m.p.h., while another, with a light load, covered 118½ miles in 99 minutes 46 seconds, start to stop, average 71·3 m.p.h., and incidentally completed the last 81½ miles in 62 minutes 55 seconds. These records were made with a light mail special. In the 1895 race to Aberdeen a London and North Western engine, again with a

light load, averaged 66 m.p.h. between Crewe and Carlisle, a by no means easy section. On many other occasions, various notable speed performances have been recorded on various lines. It is, however, in regard to daily schedules that the subject has most interest. So far as highest speeds are concerned, the fastest runs on British railways scheduled at over 60 m.p.h., start to stop, are:

Great Western Railway	177.3 miles in 75 minutes	61.8 m.p.h.
London and North	144.1 " " 43 "	61.5 m.p.h.
Eastern Railway	22.6 " " 22 "	61.5 m.p.h.

There are also one or two other runs at almost, if not quite, the 60 m.p.h. average, though in view of the record performances indicated they have to take second place. Certain longer runs probably rank even more highly, although the over-all average may be somewhat less, particularly when loads are greater than those usually associated with the record runs mentioned. Thus, the Great Western Railway has two trains booked from Paddington to Bristol, 118.3 miles in 120 minutes, average 59.2 m.p.h. These trains, moreover, each convey a slip portion for Bath, booked to arrive in 105 minutes for the 106.9 miles. There are also two up expresses between Bristol and Paddington (*viâ* the Badminton route, which is slightly shorter though rather harder than that *viâ* Bath) in 120 minutes for 117.6 miles. The Great Western Railway has also trains booked between Paddington and Exeter, 173.7 miles in 179 minutes, average 58.2 m.p.h., not to mention a large number of other trains averaging at least 55 m.p.h. for distances ranging from 100 to 226 miles. On the L.M.S.R. the highest average is given on a short run between Birmingham and Coventry, 19 minutes being allowed for a distance of 18.9 miles, start to stop. Another Birmingham express gives, however, an average of 59.2 m.p.h. for a distance of 107.5 miles to Willesden Junction, 109 minutes being allowed. On this system there is also a large number of runs exceeding 100 miles in length and giving average speeds above 50 m.p.h., and in many instances above 55 m.p.h. The L.N.E.R. has, in addition to the 61.5 m.p.h. average runs above mentioned, a Great Northern section fastest run of 57 m.p.h., applying to a distance of 105.5 miles between Grantham and King's Cross in 111 minutes, besides non-stop journeys, ranging up to 198 miles, at averages of from 50 to 57 m.p.h. The fastest schedule on the Southern Railway is between Waterloo and Salisbury, 91 minutes being allowed for a distance of 83.8 miles by three trains. In the case of the grouped railways, while there may be one or more outstanding runs which rank as the fastest throughout the system, each section usually has a number of runs which are not much, if at all, inferior thereto. The Great Northern Railway of Ireland has one train booked to cover a distance of 8.2 miles in 9 minutes, average 54.7 m.p.h.; while the Cheshire Lines Committee has a train booked to cover 15.7 miles in 18 minutes, average 52.3 m.p.h. These are the only lines where average speeds exceeding 50 m.p.h. between stops are made, though there are numerous trains on all lines not much below the 50 m.p.h. standard.

So far as length of run is concerned, the Great Western Railway leads with an extreme distance of 225.7 miles between Paddington and Plymouth, still the world's record in this respect, the L.M.S. longest being the 205.5 miles between Euston and Prestatyn, and the L.N.E. longest the 198.4 miles between King's Cross and Harrogate. In regard to numbers of trains booked to cover more than 100 miles without stop, the L.M.S.R. leads with 68 such runs, followed by the L.N.E.R. with 50, and the G.W.R. with 26. The Southern Railway offers little scope for runs of extreme length, though during the summer there are certain trains,

running on Saturdays only, between Waterloo and Boscombe or Bournemouth (Central), 106.8 or 108 miles. On several sections of the grouped railways runs which come slightly below the 100 mile standard are made, the most notable being 14 trains between St Pancras and Leicester booked to cover 99.1 miles in 107 or a few more minutes. From the point of view of locomotive performance, runs such as those between London and Brighton, 50½ or 51 miles in 60 minutes, and between Charing Cross and Folkestone, 70 miles in 80 minutes, take a high place.

To the general traveller, however, the principal consideration is the time occupied in journeys between principal cities, and the following table shows distances and best times between London and certain large towns.

Town	Distance from London	Fastest Time	Railway	Section
	h. m.	h. m.		
Aberdeen	523.7	11 40	L.N.E.R.	E. Coast.
"	529.7	11 40	L.M.S.R.	W. Coast.
Birmingham	112.9	2 00	L.M.S.R.	L. & N.W.
"	110.6	2 00	G.W.R.	—
Bristol	118.3	2 00	G.W.R.	—
Cardiff	145.1	2 40	G.W.R.	—
Chester	179.2	3 30	L.M.S.R.	L. & N.W.

York	188.2	3 30	L.N.E.R.	G.N.

(a) London Road. (b) North Road

In the United States there are several runs at about 60 m.p.h., notably those made by trains between Philadelphia and Atlantic City by the respective routes, and in France there are several schedules approximating to this level (there were many more before the war). For long journeys between the great cities of the United States and of Europe it is obviously impossible to expect more than 30-35 m.p.h. as a throughout average for several hundred or a thousand miles or more, this including stops *en route*, and the slower times necessarily taken on the mountainous stages. Apart from the United States and France, there are not many instances of averages above 50 m.p.h. for long distances, though this figure is attained in Germany, Italy, Belgium, Holland and other European countries, as also in India, South America, Canada, Australasia, and elsewhere. On the long, narrow-gauge railways of South Africa, to attain 30-35 m.p.h. throughout is very creditable work, especially when the severe gradients usual on such railways are taken into account.

Fares and Rates.—The whole question of rates and charges on British railways is still unsettled, but the standard for passenger fares may be taken at about 2d. per mile first class, and 1½d. per mile third class. The experience over a series of years has shown a constant increase in the volume of third class travel, which now accounts for about 85 per cent. of the whole passenger business in the United Kingdom. In 1872 the Midland Company

decided on the abolition of the second class, and other companies in England and Scotland gradually adopted the same policy. In the United States the average fare may be taken at 12d. per mile, extra charge being made for drawing-room and sleeping cars.

With regard to goods, the charges on British railways are higher on the whole, but the speed of the goods trains and the character of the service are superior. In the United States a great deal of the goods traffic is handled by express companies making additional charges for their services. With long hauls in some foreign countries, of course, lower mileage rates can be charged. The grain rates in America had been reduced to about 4d. per ton per mile, and on Indian railways, with cheap labour and fuel, a standard of 4d. per ton per mile was reached, but figures are now necessarily higher in both cases.

Capital, Revenue, &c.—The act of parliament authorising the construction of the Stockton and Darlington Railway, the first used for passenger traffic, received the Royal assent on 19th April 1821. The first rail was laid on 23rd May 1822, and on 27th September 1825 the railway was opened with great ceremony. Four hundred and fifty passengers were conveyed in the first train. The train arrived at Darlington, a distance of 8½ miles, in 65 minutes. When fifty years later the jubilee of the railway system was celebrated there were 16,449 miles of railway working in the United Kingdom, representing a capital cost of £600,895,000, and producing from traffic a revenue of £56,898,000, of which £24,893,000 was received from passenger fares and £32,005,000 from the conveyance of goods and minerals.

At the close of 1925 there were, as already mentioned, 20,392 route miles of railway in Great Britain. The total capital return created after adjustments following upon the amalgamations which became effective as from 1st January 1923, was £1,170,258,632. The total capital expenditure (in round figures) is £1,198,600,000. Gross receipts during the year were £199,600,000; expenditure, £165,000,000; and net receipts, £34,600,000. Numbers of passengers with ordinary tickets conveyed on a single journey basis were: 1st class, 20,788,000; 2d class, 2,772,000; 3d class, 900,729,000. Adding 308,272,000 workmen's tickets, this makes a total of 1,232,561,000. Season tickets were thus allocated on an equivalent annual basis: 1st class, 117,900; 2d class, 48,900; 3d class, 684,000—total, 850,800. Including allowances for an average number of passenger journeys made by season-ticket holders, these together represent about 1,743,000,000 passenger journeys annually. Goods and mineral traffic statistics for the year were: General merchandise, 59,712,000 tons; coal, coke, and patent fuel, 193,623,000 tons; other minerals, 62,513,000 tons—total, 315,848,000 tons. Head of live-stock carried during the year numbered 18,661,000.

The railway system of the United Kingdom has not been developed according to any plan previously marked out, nor does it owe any of the position which it now holds to support or assistance given to it by the state. It is the outcome of private enterprise carried on in very many instances under great difficulties, in spite of much national and local prejudice, and at an expenditure of capital greatly in excess of that which would have been required under more favourable conditions. In 1830 the Duke of Wellington, then at the head of the government, was asked to appoint some engineers to lay out four or more main lines which would form the great highways for the locomotive. The duke's reply was that he did not like railways; and Mr Goulburn, the Chancellor of the Exchequer, declined to take any action in the matter, on

he ground that he would create an amount of opposition which the government could not withstand. Private enterprise speedily supplied the impetus to railway development which the national government refused to give. The Liverpool and Manchester Railway was opened for traffic in 1830, and in 1838 there was a completed line between London and Birmingham. During the interval of the opening of these two lines—now absorbed in the London, Midland, and Scottish system—fifty-six acts of parliament were passed authorising the construction of 1800 miles at a total estimated cost of 45 millions.

The Railway Mania.—A later period, marked with greatly increased activity on the part of promoters and engineers, culminated in the 'Railway Mania,' followed by a great financial collapse. Parliament had required as a condition precedent of considering any new railway bills that a deposit of 10 per cent. of the estimated cost should be lodged with the accountant-general by the promoters, and 5 per cent. for parliamentary expenses. On the 30th of November in 1845, the latest date at which the Board of Trade would receive plans of new railways, there had been lodged 1263 bills, with plans and sections for new railways, representing a capital of 563 millions, and requiring the deposit of a total sum of 59 millions. The amount required for payment of the deposit exceeded by more than 20 millions the whole amount of gold and coin in the Bank of England and notes in circulation. The publication of these figures created alarm, and a panic ensued, the stocks of existing railways were greatly depreciated, and the premiums on the shares of the newly-promoted companies, which had been created by a wild spirit of speculation, disappeared, and widespread ruin and commercial disaster ensued. The result was that, of the 1263 companies which were promoted, 190 only survived the ordeal of parliament.

Railway Administration.—In order to compensate to some extent for the lack of original design and system in connection with the railways, the companies resorted at various times to numerous plans for amalgamation, fusion, purchase, or working agreements between themselves. There were in 1922, after numerous changes and dissolutions, about 290 railway companies in the United Kingdom, including light railways. Of the railways owned by these companies 97 were worked or leased by other companies. The situation is now, however, altered in material respects, arising mainly from the new conditions created by the Great War.

Post-War Developments.—During the war period British railways were administered (under the Regulation of the Forces Act, 1871) on behalf of the government by the railway executive committee, consisting of general managers of principal railways, railway revenue being guaranteed while these conditions continued. After the war control and guarantee were continued for some time, so that it was not until August 1921 that the railways were returned to independent operation. By that time, however, proposals for amalgamating into a few big companies had so far developed that, under the authority of the Ministry of Transport, a bill was brought before parliament, and eventually passed as the Railways Act of 1921, providing for the amalgamation of all the larger railways and many of the smaller ones into four big companies. As from 1st January 1923, therefore, nearly all the old companies were merged in one or other of the four new companies—the London, Midland, and Scottish, London and North Eastern, Great Western, and Southern. In Ireland, following upon the setting up of the Irish Free State, proposals were advanced in 1923-4 for amalgamating all the railways

in the latter into one concern, and except for the Great Northern Railway and railways in Northern Ireland, all except a few minor concerns are now combined as the Great Southern Railways.

Receipts for traffic in which more than one railway is concerned are allocated by the Railway Clearing-house (see CLEARING-HOUSE). In 1888 an act was passed giving to the Board of Trade authority to call for returns, and deal with the schedules of rates and classifications of the companies. This work is now in the hands of the Ministry of Transport, in view of the Ministry of Transport Act of 1919 and the Railways Act of 1921.

The earliest railways were authorised on the supposition that they would, like canals, be highways for the use of carriers. A scale of maximum tolls was prescribed in each act, and the canal classification of goods adopted. Later on the railway companies prepared a new classification. Each railway act also contained a clause authorising the railway company to charge a reasonable sum in addition to the maximum tolls, in order to cover carriers' services, risks, and profit.

Although the companies had thus power to charge certain rates, the *maxima* were seldom enforced; but even with the lower level of actual charges the traders were dissatisfied, and demanded frequent inquiries into the working of railways. Three such inquiries were held between 1866 and 1884, but the companies were on the whole acquitted of the charges brought against them. As the result of the inquiry of 1872 a Railway Commission of three members was appointed, for five years, to deal with disputes between traders and the railways. This commission was renewed in 1878 and 1883, and as the result of further inquiry the act of 1888 appointed a permanent commission to sit in England, Scotland, and Ireland to decide all questions arising under the various acts, and as to rates. Renewed dissatisfaction as to rates led to another inquiry by a select committee in 1893; and this resulted in the act of 1894, further regulating the powers of the companies as to rates, which has worked in a fairly satisfactory manner. Under the Railways Act of 1921 a Railway Rates Tribunal was set up to deal with the whole question of rates and charges. Its sittings were still in progress at the time of writing.

Results of Railway Working.—At the time when the Liverpool and Manchester Railway was completed, ten miles an hour travelled by the fast stage and mail coaches was about the limit of speed attainable. At the opening of the London and Birmingham Railway there were 3026 stage-coaches, 54 four-horse and 49 pair-horse mail-coaches in use. The full seating capacity of these vehicles, each being licensed to carry fifteen passengers, would represent 16,500,000 individual journeys in the course of the year, and it may be safely assumed that not more than 10 millions of such journeys were made. The extent of correspondence among the population was officially stated at 82 millions of letters. In 1924 the number of passengers carried on the railways was nearly 1743 millions. On the basis of work done by stage-coaches in 1837, we should require nearly a million of these vehicles to move the passengers now conveyed over the 20,000 or so miles of railway. On 30th November 1839 the first of Her Majesty's mails was transferred from the mail-coach to the railway. The increased facilities thus afforded converted a uniform penny post from a theory into a reality when that system came into operation on 5th December 1839. The news in those days was carried at an average speed of 8½ miles per hour. The railways carry the mails at an average speed of over 45 miles per hour.

There are now about 680,000 employees on the railways of Great Britain, the most numerous classes being: clerks about 85,000; enginemen, 85,000; guards, 26,000; labourers, 38,000; permanent way men, 64,000; porters, 28,000; cartage men, 20,000; signalmen, 30,000. In view of difficulties which arose largely from the railway strike of 1911, a system of Conciliation Boards was set up in that year, and, although modifications have since been made, the general system still obtains, elaborated by Central and National Wages Boards to decide matters in dispute. In 1919, in view of conditions which had arisen during the war period, an eight-hour day was standardised throughout the greater part of the railway service, and, in conjunction with arrangements by which wages were governed by the official cost of living figures, a system of grading with minimum wages for employees in each grade or class was set up. Slight modifications have since been made, but, in the aggregate, these arrangements still obtain.

State Ownership of Railways.—It may be assumed in general that railway construction and development has been less hampered by state interference in the British Islands and in the United States than in any other parts of the world, and it is precisely in these countries that railways have attained their highest development. In the Railway Act of 1844, power was given to the state to acquire the lines in the United Kingdom at 25 years' purchase of the annual divisible profits estimated upon the average of the three next preceding years, conditioned, however, on right being reserved to those companies which were not receiving dividends equal to 10 per cent. on the capital stock to require that the purchase price should be left to arbitration. The question of state purchase was left an open question by the act, and, moreover, some 2300 miles of line previously sanctioned were not covered by its provisions. In most of the British colonies the government has either built or subsequently purchased the lines. Railway construction in France was undertaken in a much more methodical manner than in Great Britain. The country is partitioned out among six great companies, and competition has thus been entirely avoided. The government owns about one-third of the capital invested, and will ultimately about the middle of the 20th century become the absolute proprietor of the various systems. The state has the right to fix fares and charges, and to determine the amount of new mileage to be constructed from time to time. So far as technical skill is concerned, the railways of the country are well managed, but, except for the chief expresses, the accommodation provided is far inferior to that in Great Britain or the United States; passenger-trains, other than the fast through and international trains, are comparatively few and crowded, and the freight service is very slow. The main lines are very remunerative in their operations, but the local roads are mostly worked at a loss. In Germany the roads were owned and managed by the government, and political and military considerations were paramount in the working of the system. They are now administered by a specially formed company with international control. The lines were cheaply constructed, the cost being less than half per mile that in Great Britain. The tendency in most other European countries is towards state ownership or control of railways.

Railways in the United States.—By far the greatest and most rapid development of railway construction in proportion to population has taken place in the United States, and the working of railways in all parts of the world owes much to the characteristic inventive genius of Americans. The building of railways has not been hampered in the

United States by undue legislative restrictions, and it is only recently that state ownership has been seriously discussed; land has been cheap or free for occupation, and the distances to be traversed are great. Before the date of the celebrated locomotive trial which evolved the 'Rocket' an engine was run in America called the 'Stourbridge Lion,' a machine made in England, and imported by the Delaware and Hudson Canal Railroad Company. The first railroad in the United States was, however, begun in 1828 by the Baltimore and Ohio Company, a section of 15 miles from Baltimore to Ellicott's Mills being opened in May 1830. Horse-traction was first used on this line. American engines are now found competing with English-built machines in many parts of the world.

It is, however, in the matter of carriage construction that the American railroad engineer has marked out an independent path and obtained the most striking results. For many years European railway carriages adhered closely to the model of the old stage coach. The longer distances travelled on the American continent, and the republican spirit which objected to the division of classes, led to the adoption across the Atlantic of the long railroad car, with a central passage between the seats. The great size and weight of these structures necessitated increased attention to such details as springs, couplings, and brakes, and in the provision of such accessories for comfort and safety American railroad practice was for long in advance of that in any other part of the world. Republican simplicity notwithstanding, the demand for improved accommodation gave rise to drawing-room, sleeping, and dining-room cars, and the stock turned out for these purposes by the Pullman and other companies challenged comparison with the provision made for the travel of royalty in the Old World. The 'Vestibule' trains running on most of the trunk-lines for long distances—say between New York and Chicago—represent the highest ideal yet obtained of luxurious travelling. Railway stock of this character is partly owned by independent companies, whose officials collect the extra fares for the accommodation.

In the United States, from 1830 to 1923, a total of 265,000 miles has been constructed, about one-third of the railways of the world. Previous to 1850, the greater portion of the railroads made were in the states bordering on the Atlantic, and were for the most part isolated lines employed for local traffic. A great development to this form of enterprise was given by the discovery of gold in California, and lines were rapidly pushed towards the centre of the continent. The great civil war at the commencement of the next decade emphasised the necessity of direct communication with the growing Pacific states to cement the Union, and government assistance was freely given both in land-grants and money to the two companies, the Union Pacific and Central Pacific, which, building respectively from the east and the west, met near Salt Lake City in May 1869, the total length from the Missouri River to San Francisco being 1700 miles. Since that date other transcontinental lines have been completed, including the Canadian Pacific and Canadian National routes across Canada. The rate of general railroad construction has varied considerably, but the most active period was that between 1880 and 1890. In 1882 11,569 miles were built, and in 1887 no less than 12,878. A large extent of this mileage was built in advance of the necessities of the districts traversed, and in other cases existing lines were paralleled to the heavy loss of the interests concerned. These periods of over-construction and resulting competition, combined with a necessary reduction of mileage rates as the centre of agricultural production moved westward across the

continent, caused at times much depression in railroad securities. The system of finance under which the companies borrow money on mortgages with foreclosure powers (not possessed by owners of British railway debentures) has also been the cause of heavy loss to investors in American railroads, many of which have passed through the ordeal of reorganisation with the accompanying 'assessment' or 'wiping out' of junior securities.

To remedy the effects of over-competition, a system of 'pooling' receipts was adopted by the various trunk-lines. Under this plan the receipts from any given description of traffic were made into a common purse, and divided among the companies concerned in an agreed ratio. The State railroad commissions were powerless to deal with traffic originating or passing out of their respective territories; but in 1888 the Interstate Commerce Commission was appointed with federal authority to deal with questions affecting railway traffic. Under the law appointing the commission, 'pooling' receipts was made illegal, and the well-known 'long and short haul' clause, establishing uniform mileage rates, was, contrary to the result, expected to produce disastrous results to railway revenues.

During following years many developments occurred, but the placing of the railways under federal control when the United States entered the Great War, and for some time after its conclusion, introduced new conditions, and a new railway era is in process of evolution. During 1921-22 a proposed Transportation Act introduced new features, and its passing has given rise to a number of schemes for amalgamations on varying principles. It is practically certain that such amalgamations will occur in due course, but it is not yet clear how they will be carried out. Meanwhile, the creation of a Railway Labour Board and anti-railway political action, together with the conditions occasioned by the high ratio of expenditure to revenue and the post-war trade depression, have rendered it difficult to provide for the 'standard' revenue indicated by the Transportation Act, and at the same time to carry passengers and freight at reasonable though necessarily increased rates.

Capital invested in United States railways amounts to some \$20,000,000,000, applying to about 260,000 route miles. Revenue for twelve months is in the neighbourhood of \$6,300,000,000. Operating expenditure is about \$5,000,000,000, the ratio to revenue being approximately 80, while the return on valuation is about 4.53 per cent. The equipment includes about 70,000 locomotives, 60,000 passenger cars and 2,500,000 freight cars (average 42.5), together with 110,000 service vehicles. There are about 1,800,000 railway employees. During twelve months some 1,050,000,000 passengers are conveyed by United States railways, while freight tonnage amounts to some 2,000,000,000. The average passenger journey is 36 miles and the average freight journey 178 miles. The average tonnage of freight trains is about 640.

While by far the greater proportion of passenger trains do not reach high average speeds, largely owing to the fact that in the country districts even the expresses have to do much intermediate work, while routes are largely single track and gradients frequently very severe, in the neighbourhood of the great cities and connecting them very creditable express trains are run. On a few particular services, such as those between Philadelphia and Atlantic City, there are, indeed, expresses averaging over or substantially 60 m.p.h., and a number of the inter-town expresses, such as those between Philadelphia, New York, Boston, Washington, &c., average 55 m.p.h. or even more. In general, however, speeds do not usually reach 50 m.p.h.,

and for the long runs very creditable work is required to haul lengthy and heavy trains of all-steel cars at averages of between 30 and 40 m.p.h., including stops, for several hundred or a thousand miles.

Colonial and Foreign Railways.—Canadian railways adopt methods more or less akin to those of the United States, and it is, indeed, a practical necessity that they should do so, in that physical connection is made with United States lines in many places. Certain Canadian train services are through to places beyond the frontier, and both passenger and freight cars have necessarily to circulate to some extent in both countries. Until recently the two great railways were the Canadian Pacific and the Grand Trunk Railway of Canada, there being also the Grand Trunk Pacific, Canadian Northern, Inter-Colonial and a few other lines. During 1921-23 the Grand Trunk Pacific was first combined with the Canadian Northern, Inter-Colonial and other lines, to form a new National system, and the Grand Trunk was then added, so that these lines together form what are now known as the Canadian National Railways, leaving the Canadian Pacific as the principal, if not the only, railway not under direct government control. The Canadian National Railways are, however, organised as a company, in which practically all the stock is held by the government. Together, these railways provide a route mileage of approximately 40,000 miles, the Canadian National system being slightly the larger. Capital cost is approximately \$300,000,000. During a recent year some 45,000,000 passengers were carried an average journey of 64·8 miles, while some 103,000,000 tons of freight were carried an average haul of 296 miles. Total receipts annually are about \$450,000,000, and operating expenditure \$390,000,000. Employees number about 160,000. For traffic purposes there are approximately 6100 locomotives, 6800 passenger vehicles, 232,000 freight cars, and 17,500 service vehicles.

In the case of Indian railways there is considerable diversity in the relations of the state to the various lines in respect of ownership and control. Five of the large systems in which the government of India is interested are owned and worked by the state; six are owned by the state, but worked on its behalf by companies enjoying a guarantee of interest from the government; three others, and many of less importance, are the property of private companies, some being worked by the owning companies and some by the state or by companies that work state-owned systems; and several minor lines are the property of district boards or enjoy a guarantee of interest granted by such boards. In the case of all railways, however, the government of India exercises certain general powers, and under the provisions of contracts, exercises detailed control over management, and by virtue of financial interests (preponderating in the case of most of those of first importance) has considerable power and influence in the working of virtually all railways. A majority of the contracts with earlier companies provided for acquisition by the state on specified dates, and many systems have been thus taken over, though in several instances new leasing or working contracts have been made, so that present conditions are essentially different from the earlier ones they succeeded, even where they bear the same titles. These new contracts have often been associated with a degree of re-arrangement; other systems, or parts thereof, being associated in such new contracts.

In the early days of railway enterprise in India the agency of private companies guaranteed by the state was exclusively employed, and nearly all the great trunk-lines of the country were made under

this system. The government gave the land for the lines free of charge, and guaranteed interest generally at 5 per cent. on the share capital and a lower rate upon the debentures for ninety-nine years. Any surplus earnings after the guaranteed rates were paid were divided equally between the government and the companies. Moreover, the government retained the right of buying the undertakings at specified dates on payment of the value of the stock calculated at its market price on the average of the three preceding years. In this way the East Indian Railway was acquired in 1880, the Eastern Bengal in 1884, the Sind, Punjab, and Delhi in 1885-86, the Oudh and Rohilkund at the end of 1888, the South Indian in 1890, the Great Indian Peninsula in 1900, the Bombay and Baroda in 1906, the Madras in 1908, and the Indian Midland in 1910. In 1870 a new policy of railway development by the direct agency of the state was inaugurated; and in 1880-81 the system of encouraging private enterprise by state assistance was again adopted. Both agencies are now employed. In some instances—notably the Bengal and North-Western line—railways have been constructed without any direct pecuniary assistance; in others a subsidy or limited guarantee has been granted. The agency of private companies has also been employed by the government both in the construction and working of state lines. In all cases the government has the power of taking over the railways at specified periods on stated terms, and in 1925 the East Indian and Great Indian Peninsular Railways were thus taken over. In 1884 a select committee reported in favour of a more rapid extension of railways than had been taking place, and recommended the broad gauge—i.e. 5 feet 6 inches—except in tracts where the metre or smaller gauge was already in successful operation, and for local lines where the traffic could only be light. A valuable and comprehensive report was prepared by Mr Thomas Robertson, the special commissioner appointed by Lord Curzon to inquire into the working and administration of Indian railways. The first railway opened in India was that of the Great Indian Peninsula Company from Bombay to Tannah, traffic being commenced on 4th May 1853. There is a total railway mileage of approximately 38,000. Some 550,000,000 passengers are conveyed annually an average journey of 38·66 miles, while freight tonnage is about 90,000,000, the average haul being 32 miles. Total receipts are about £65,000,000, and operating expenses £40,000,000. Railway employees number about 712,000. There are approximately 9100 locomotives, 25,000 passenger vehicles, and 197 freight vehicles.

In South Africa practically all the railways are now in the hands of the Union railway system, except as regards Rhodesia and certain other districts, where, however, relations are very close. The South African Government Railways operate approximately 12,000 miles of railway, with 1900 locomotives, 3100 passenger vehicles, and 33,000 freight vehicles, while the number of passengers carried annually is about 66,000,000, and freight tonnage approximately 19,000,000. In Cape Colony the first railway was opened 26th June 1860.

In Australasia practically all the railways are owned and operated by the respective states. More recently, the Commonwealth government has also undertaken the construction of railways in various districts where the individual governments could hardly be expected to do so. A vexed question in Australia is that of gauge, which offers important hindrances to the working of through traffic. Thus, while New South Wales and the Commonwealth itself use the ordinary gauge of 4 feet 8½ inches, in Victoria and South Australia

the Irish gauge of 5 feet 3 inches is used. South Australia has also a considerable mileage of 3 feet 6 inch gauge, which is also the gauge of Queensland and Western Australia. Tasmania and New Zealand use the 3 feet 6 inch gauge, but as they are islands this occasions no particular difficulty. A few general particulars may be given in tabular form.

	Route Mile- age	No. of Loco- motives	No. of Passenger Vehicles	No. of Freight Vehicles	Annual No. of Passengers	Annual Freight Tonnage
New South Wales	5,530	1,375	2,194	21,928	128,000,000	6,500,000
Queens- land	6,040	713	920	15,598	29,535,981	4,273,926
South Australia	3,452	486	724	9,350	25,177,933	3,565,307
Tasmania	673	66	232	1,797	2,959,887	706,961
Victoria	4,443	747	1,894	19,235	167,861,864	8,309,543
Western Australia	3,629	406	665	9,974	18,133,108	3,023,299
New Zealand	3,063	655	1,527	26,195	13,836,311	6,925,517

The dates of opening of the first lines of each colony are: Victoria, 13th September 1854; New South Wales, 29th May 1855; Queensland, 31st July 1865; South Australia, 26th April 1856; Western Australia, 21st January 1864; Tasmania, 10th February 1871; New Zealand, 1st December 1863.

In Europe many changes have occurred during recent years as a result of re-arrangement of territory in certain districts as a consequence of the war. Conditions are, moreover, in a transitory state, while the railways are in many instances in process of re-equipment. It will, therefore, be sufficient to indicate briefly the approximate present-day mileage in the principal countries.

	First Railway opened	Mileage	
Austria	—	1,090	
Belgium	5th May 1835	6,900	Including local railways
Bulgaria	—	1,630	
Czechoslovakia	—	8,500	
Denmark	18th September 1844	620	
Estonia	—	2,700	
France	1st October 1825	33,300	
Germany	7th December 1835	35,200	
Greece	18th February 1869	1,860	
Hungary	20th September 1828	4,400	
Italy	3d October 1839	13,600	
Latvia	—	1,750	
Lithuania	—	1,650	
Netherlands	13th September 1839	2,190	
Norway	14th July 1853	2,100	
Poland	—	9,900	
Portugal	9th July 1854	2,100	
Romania	—	7,500	
Spain	30th October 1848	9,700	
Sweden	9th February 1861	9,500	
Switzerland	15th June 1844	3,400	
Turkey	4th October 1869	630	
Yugoslavia	—	5,000	

In the case of Russia, figures remaining after the formation of new countries indicated are too indefinite to be stated. Prior to dissociation the proper mileage for Russia, Siberia, Finland, &c., was in the neighbourhood of 55,000. The total European mileage is approximately 237,000, of which about half is state-owned. North and South America have some 380,000 miles, of which about 51,000 are state-owned. In Asia there are approximately 75,000 miles of railway, about two-thirds being state-owned. In Africa there are about 33,000 miles, of which approximately 18,000 are state-owned; and in Australasia the total of about 25,000 miles is almost entirely state-owned.

For completeness, the approximate mileages in a few other countries may be mentioned, as follows:

	Opening date	Mileage
Argentina	14th December 1864	23,200
Brazil	30th April 1854	17,800
Chile	January 1852	5,500
China	—	7,000
Egypt and Sudan	26th January 1856	4,500
Japan	—	9,300
Mexico	8th October 1850	16,200
Peru	29th May 1851	2,000

Rain. Whatever lowers the temperature of the air below the point of saturation, or the dew-point, may be regarded as a cause of rain. Various causes may conspire to bring about this change of temperature, but by far the most important of these originate in winds and other movements of the atmosphere. The more prominent principles of the connection of the winds to the rainfall are these: (1) When the winds have traversed a considerable extent of ocean before reaching land the rainfall is large; (2) when the winds, on arriving at the land, advance into higher latitudes or into colder regions the rainfall is largely increased, for the simple reason that the air is now more rapidly brought below the point of saturation; (3) if the winds, even though they arrive directly from the ocean, have not traversed a considerable breadth of it, the rainfall is not large—indeed, in the case of the sea-board of Lower California the mean annual amount, as at San Diego, is only 10 inches; (4) if the winds, even though they have crossed a great extent of ocean, yet on arriving at the land at once advance into lower latitudes or into warmer regions, the rainfall is small; (5) if a range of mountains lie across the onward course of the winds, the rainfall is largely increased on the side facing the winds, but reduced over the region on the other side of the range; the reason being that, as the air on the windward side of the ridge is

suddenly raised to a greater height in crossing the ridge, the temperature is still more reduced by mere expansion, and a more copious precipitation is the consequence. On the lee side, as the air descends to lower levels, it gradually gets drier, and hence the rainfall of necessity diminishes with every stage of the descent to lower levels.

Attention may be here drawn to the diminished velocity of the wind over land as compared with the open sea. The observations of the *Challenger* Expedition (q.v.) in 1872-76 proved that an envelope of stiller air, or air of less velocity as compared with that of the ocean, broods over the land, and by its presence forces the wind blowing across the land to a greater height, thus augmenting the rainfall. This dragging effect of the land on the wind, and the important consequences resulting from it, explain how it is that during north-easterly storms of rain the foreshores of the Firth of Forth, Moray Firth, and Pentland Firth, which look to the north-east, receive a much heavier rainfall than other parts of Scotland in these circumstances. On the Ayrshire coast the annual rainfall at Ayr is 38 inches, but at Girvan it rises to 51 inches. Both stations are close to the coast, the only difference being that the hills to the eastward approach much nearer the coast at Girvan.

For short periods the heaviest rainfalls occur with thunderstorms, and with tornadoes, water-spouts, and other forms of the whirlwind, for the reason that there is rapid expansion due not only to the rapid ascent of the air, but also to great rarefaction produced by the extreme velocity of the gyrations of the air round the axis of the whirlwind. One of the heaviest rainfalls yet recorded in the British Islands was 2.24 inches in 40 minutes at Lednathie, Forfarshire, during a severe thunderstorm on 18th June 1887. At Camberwell, London, 3.12 inches fell in 2 hours 17 minutes on 1st August 1846. Of heavy falls during one day the following may be mentioned: Bruton, Somersetshire, 9.56 inches, 28th June 1917; Cannington, Somersetshire, 9.40 inches, 18th August 1924; Kinlochquich, Inverness, 8.20 inches, 11th October 1916; Seathwaite, Cumberland, 8.03 inches, 12th November 1897; Ben Nevis Observatory, 7.74 inches, 6th February 1894; Brindall, Norfolk, 7.31 inches, 26th August 1912; Angerton Hall, Northumberland, 6.70 inches, 7th September 1898; Doncaster, 6.06 inches, 17th September 1913.

In the United States, where severe thunderstorms and tornadoes more frequently occur, the daily rainfalls repeatedly exceed these amounts. Thus, during the years 1885-89 the following heavy rainfalls of one day were recorded: Brownsville, Texas, 12.94 inches in September 1886; Pensacola, 10.70 inches, June 1887; Key West, 7.80 inches, September 1889; Chattanooga, 7.61 inches, March 1886; Shreveport, 7.54 inches, January 1885; and a day's rainfall of from 5 to 7 inches is repeatedly recorded in the United States. These amounts are greatly exceeded in lower latitudes. In 1906, 41 inches fell in 13 hours at Suva (Fiji Islands); while on the Khasi Hills, India, 30 inches on each of five successive days have been recorded; at Bombay, 24 inches in one night; and at Gibraltar, 35 inches in 26 hours.

As regards the ocean little is yet known from observation. This, however, is clear, that in the equatorial belt of calms between the regions swept by the two trades the rainfall of the ocean reaches the maximum; and the parts of the Atlantic and Pacific which are longest within the belt of calms as it shifts northward and southward with season have the heaviest ocean rainfall. But, though the cloud-screen is unquestionably dense and the rainfall frequent and heavy, the observations of the

ments generally made as to these are very greatly exaggerated. Over the open sea in the regions of the trades the rainfall is everywhere small, owing to the circumstance that these winds are an immediate outflow from anti-cyclonic regions, their dryness being further increased since their course is directed in regions that become constantly warmer.

The trades, however, deposit a larger rainfall over islands and other land-surfaces which they traverse; the amounts being proportional to the height of the land, but more particularly to the degree in which the high land ranges lie across the paths of the winds. Thus, at Ascension, which is within the south-east trades the whole year round, the annual rainfall is 5.16 inches on the low ground, but it increases to 26.02 inches on Green Mountain; at St Helena on the coast it is 5.47 inches, but on the high land in the interior of the island it rises to 40 inches. In the western division of the Pacific, for some distance on each side of the equator, the rainfall is very slight, and extensive guano deposits are formed on Malden and other islands scattered over that region. In Mauritius, on the weather shore of the island, the annual rainfall is about 50 inches; but at Cluny, 16 miles inland, it is 146 inches, the latter place being in the neighbourhood of extensive forest-clad mountains.

The heaviest rainfalls of the globe are brought by the winds which have traversed the greatest extent of ocean within the tropics. These conditions are most completely fulfilled from June to September by the winds which, beginning their course from about 30° S. lat., blow north on southern Asia as the south-west monsoon, which accordingly distributes a heavier rainfall over a larger portion of the earth's surface than occurs anywhere else in any season. On these summer winds the rainfall of India chiefly depends, and the 'lie' of the mountain systems with respect to the winds intensifies the effects. The following in inches are the annual amounts at different points in the west from Suva southward: Suva, 41; Bombay, 71; Mahabaleswar, 263; Banca, 251; Honavar, 139; Calicut, 117; and Cochin, 115. In the west of Ceylon the rainfall is also large, being at Colombo 83, at Galle 92, at Ratnapura, inland among the hills, 151; but in the east of the island, before reaching which the monsoon is deprived of much of its moisture, it is considerably less, being at Mannar 39, at Jaffna 49, and at Trincomali 63. The rainfall is also very large in Burma, being at Akyab 196, Sandaway 214, Diamond Island 118, Rangoon 99, Tavoy 215, Mergui 163, and Port Blair 117. In the north-east angle of the Bay of Bengal, and thence north to Bhutan, the rainfall is great, rising at Cherapunji, in the Khasi Hills district, to 424 inches—or about 35 feet—being one of the largest known rainfalls anywhere on the globe. Owing to this diversion in the course of the monsoon the valley of the Ganges enjoys a generous rainfall. On the other hand, the rainfall is small over the plains of the Punjab, being at Multan 6.92 and at Kurachi 7.64, increasing over the higher parts of the province, at Lahore 20, Umballa 31, Simla 63, and Dharnasala 122.

The key to the distribution of rainfall over the East Indian Archipelago and Australia is the distribution of pressure from south-eastern Asia to Australia, with the resulting prevailing winds. During the winter months pressure diminishes rapidly from Asia southwards, and northerly winds prevail. Now, as these winds have travelled a great breadth of ocean, they arrive in a highly saturated state and deposit a heavy rainfall over these islands and the north of Australia. The degree to which these rains penetrate into Aus-
nigh the

winter monsoon. On the other hand, during the summer months pressure increases from Asia southwards, and southerly winds set in from Australia to Asia, distributing in their course a very large rainfall over the islands of the Eastern Archipelago, rising at several places to 30 inches a month. The small rainfall in such islands as Timor, which are more immediately sheltered, as it were, by Australia during these southerly winds, impresses on the region well-marked dry and wet annual seasons. These marked differences among the climates of this archipelago really depend on the geographical distribution of land and sea in this part of the globe, and must therefore be regarded as permanent differences, and as having played no inconspicuous part in the unique distribution of animal and vegetable life which is so characteristic of the archipelago. Since in the summer of the southern hemisphere the winds blow from the sea inland, and in the winter from the land seaward, it follows that generally the summer is the rainiest season. In the interior, along the Murray River and its affluents, the rainfall everywhere is necessarily small. In the north of New Zealand the winter rainfall is the heaviest, but farther south, where the wet westerly winds prevail with some constancy at all seasons, the rainfall is distributed pretty equally through the year, and is of course largest on the western slopes of these islands. Thus, while in the east it is at Dunedin 37 and at Christchurch 25 inches, in the west it is at Hokitika 116, and at Bealy, inland, 106 inches.

Europe as regards its rainfall may be divided into two regions—the countries bordering on the Mediterranean, and the rest of the continent. A vast ocean on one hand, a great continent on the other, and a prevalence of westerly winds, rule the distribution of the rainfall in western and northern Europe. Now, since these westerly winds have traversed a vast extent of ocean before arriving at the land they distribute a large rainfall, particularly on hilly regions opposing their course. Thus, over a large part of the Highlands of Scotland more than 80 inches fall annually, and over fully one-third of the British Islands the annual amount exceeds 40 inches. On the other hand, in eastern districts on the lee side of the great mountain-ranges, the rainfall does not exceed 30 inches over a large portion of England and in some of the best agricultural districts of Scotland. In the west of Norway it is 68 inches at Bergen, 46 inches at the Lofoden Isles, and 10 inches at the North Cape; over large portions of Sweden it is 21 inches, and in Russia and Siberia it varies from below 10 to 25 inches. Spain presents great extremes, from 70 in the north-west to 13 inches at Saragossa. In the plains of France and Germany it varies from 20 to 35 inches, rising, however, on approaching the Alps to more than 100 inches. In western Europe the greater part of the rain falls in winter, but in the interior of the continent in summer. The summer climates of the extreme south of Europe and in the north of Africa, situated at comparatively low levels, are practically rainless.

The summer winds in the south-east of the United States are southerly; and, as they have previously traversed a considerable extent of ocean, they arrive well but not supersaturated, and pour down a monthly rainfall of 6 inches or more from Louisiana to Chesapeake Bay. The comparative equableness of the rainfall over the eastern states is the result of the absence of mountain-ridges lying athwart their path, and of the winds passing into higher latitudes and therefore cooler regions. Again, the distribution and amount of the summer rainfall in the west and north of the United States is really determined by the low atmospheric pres-

sure which has its centre in the region of the Rocky Mountains. To the west of this low pressure winds are generally north-westerly, and as they thus pass into hotter regions the summer rainfall in these parts of the United States and Canada is either nothing or very small; whereas on the east side winds are southerly, and the rainfall consequently equals, or even exceeds, that of the finest agricultural districts of Great Britain.

As regards the rainfall of the two months, January and July, the following show in inches the average amounts for various places: Vera Cruz, 1·59 and 7·84; Pará, 12·52 and 5·91; Manaus, 8·50 and 1·50; Buenos Aires, 3·15 and 2·21; Corrientes, 5·24 and 2·67; and in Africa—Alexandria, 2·13 and 0·00; Algiers, 4·02 and 0·12; Senegal, 0·28 and 3·00; Sierra Leone, 0·41 and 35·58; Cape Town, 0·70 and 3·65; Durban, 4·57 and 1·24; and Zanzibar, 3·07 and 2·44. The explanation of these and similar differences is found in the seasonal changes of the wind. South Africa presents the strongest contrasts of climate so far as the rainfall is concerned, its climates being divided into two totally distinct classes, the climates of the Natal coast and of the inland regions where the rains occur during the summer months, and the climates of the other regions where the rains fall chiefly during the winter months. The driest region of Africa is doubtless the Sahara, and the wettest the coast of Sierra Leone, Liberia, and the Bight of Biafra.

See Hann's *Climatological Atlas*, and the Physical Atlas by Duchan, Bartholomew, and Herbertson (1899); Herbertson's *Distribution of Rainfall over the Land* (1901); H. R. Mill's annual *British Rainfall*; M. de C. S. Salter's, *The Rainfall of the British Isles* (1923); Loomis's *Meteorology* (new ed. 1889). See also METEOROLOGY, RAIN-GAUGE, BLOOD-RAIN, SHOWERS.

Rain-birds. any birds popularly supposed to foretell rain by their cry—many of them cuckoos of various species in North America, India, and the Malay Peninsula. It is doubtful whether any reliable forecast of the weather can be thus obtained.

Rainbow. The rainbow is the best known of all optical meteorological phenomena, consisting of a coloured arch formed opposite the sun on falling raindrops, and visible whenever the necessary conditions of a passing shower on one side and a clear and not too high sun on the other occur. Two bows are frequently seen, each exhibiting the full spectrum of colours from red to violet; but in the inner or primary bow the red is the outer edge and violet the inner, while in the outer or secondary bow the

Fig. 1.

order is reversed, the red being inside and the violet on the exterior. The colours are always arranged in a definite order, that of the solar spectrum—viz. red, orange, yellow, green, blue, indigo, and violet, but shade imperceptibly into

each other. The cause of this breaking up of the sunlight into its constituent colours is explained in most physical and meteorological text-books (see *Light*, by Professor Tait, chap. x., or *Meteorology*, by P. Loomis, par. 416), but may be briefly summarised as follows:

For the primary bow (fig. 1), let PQR represent the section of a raindrop, and SP a ray of light falling on it. The ray enters the drop at P, meets the surface again at R, is reflected to Q, where it leaves the drop in the direction QE. The ray is refracted or bent on entering the drop at P and again on emerging at Q—the amount of this refraction depending on the acuteness of the angle at which the ray meets the surface. Now it may be shown that there is a particular point P, such that any ray from S striking the surface below P emerges again above Q, and any ray above P also emerges above Q—the former owing to the more acute angle of the reflection, and the latter to the greater refraction on entering and leaving the drop. The course of two such rays is shown by the dotted lines in fig. 1. Q is thus a turning-point in the emerging rays, and near it a very large number of rays pass out, and an observer at E sees a bright image of S in the direction EQ. This statement applies to any one colour of sunlight; but, as the refrangibility increases from red to violet, the latter is bent more at P and Q, and the line EQ lies at a flatter angle. The observer, therefore, sees the violet rays reflected on drops at

Fig. 2.

a less altitude than those that reflect the red, the other colours being intermediate. The raindrop being spherical, this reflection takes place in all directions, the fixed condition being the radius of the bow, that is the angle between the line from the observer to the bow and that passing from the sun to the observer, or, in other words, the observer's shadow. For red light this angle is $42^{\circ} 39'$, and for violet $40^{\circ} 13'$. If the sun were a luminous point each colour would be sharply defined, but as the disc of the sun subtends an angle of about $30'$ each colour is broadened to this amount, and they overlap.

Exactly similar reasoning explains the secondary bow (fig. 2). The light that forms it has been twice reflected, at R and at R', the point Q lies above P, and rays entering either above or below P all emerge below Q. A glance at the diagram will show that the greater bending of the more refrangible rays makes the line EQ more nearly vertical, and therefore the violet rays form the outer edge and the red the inner of the secondary bow. The radius of the red is $50^{\circ} 5'$, and of the violet $54^{\circ} 0'$. The space between the bows gets no reflected light, but that inside the primary and outside the secondary is faintly illuminated by rays such as are indicated by the dotted lines in fig. 1 and their equivalents in fig. 2, which are not shown. These rays 'interfere' (see INTERFERENCE) with each other, and cause alternations of colour which appear as spurious bows inside the primary and outside the secondary. They can only be seen with strong sunlight and small drops of rain.

The radius of the primary bow being roughly 40° , it is evident that it cannot be seen when the sun is at a greater elevation than this, as the highest part of the bow would lie below the horizon. Hence in the latitude of Edinburgh rainbows cannot be seen for several hours about noon at the time of the summer solstice. If the drops of water be very small the interference of the rays causes such a complete overlapping of the colours that the bow appears white: this is the case generally with a fog-bow.

Intersecting rainbows have frequently been seen. When the sun is reflected from a surface of still water a bow is formed by the reflected image as well as by the sun itself. Lunar rainbows often occur, but the feebleness of the moon's light usually prevents any colours being observed. There are many popular weather prognostications connected with rainbows, all dependent on the fact that they imply local passing showers. 'A rainbow in the morning is the shepherd's warning; a rainbow at night is the shepherd's delight,' is easily understood when we remember that the rainbow is formed opposite the sun, and that weather-changes in the British Islands generally pass from west to east.

Rainey's Corpuscles. See GREGARINIDA.

Rain-gauge. The quantity of rain that falls is measured by a rain-gauge, of which there are many patterns in use. As experience has shown the great desirability of uniformity, either the Snowdon pattern, 5 inches in diameter, or the Meteorological Office pattern, 8 inches in diameter, should be employed. In no circumstances should rain-gauges of the Howard, Fleming, Symons, or British Association pattern be used, since experiments have shown that they are all open to grave

'Snowdon' Rain-gauge.

Reproduced by permission of H.M. Stationery Office from Form 1111, issued by Meteorological Office, Air Ministry

defects. The Snowdon gauge (see fig.) consists of a copper or tin cylinder 5 inches in diameter, and about 18 inches long, sunk 6 inches in the earth, so that the receiving surface is as near as possible 1 foot above the ground. In order to

prevent out-splashing during very heavy falls of rain or hail, and also to facilitate the retention of snow in high winds, the funnel which communicates with the bottle or can in the interior of the cylinder is placed 4 inches below the rim of the rain-gauge, which is sharp-edged. To the left of the rain-gauge is shown the graduated glass measure; this holds half-an-inch of rain, and is graduated in tenths and hundredths of an inch. To facilitate the measurement of amounts of less than one hundredth of an inch, the rain-glass is made conical below.

A rain-gauge should be placed on a level piece of ground, at a distance from every object higher than itself, and not nearer to a wall or a house than a distance equal to the height of that object. The gauge should be planted in the earth, or placed in a hole which exactly fits it in a block of cement, so that it will keep level even in the strongest wind. Various forms of recording rain-gauges have been invented. Of these, perhaps the best known are the Beckley and the Hyetograph, but the more recent 'natural syphon' patterns possess important advantages over the older forms. In these automatic gauges a continuous trace of the rain that has fallen is given by means of a pen on a revolving drum actuated by clockwork. In this way is shown not only the amount, but the time over which the rainfall is spread. The drum carrying a specially prepared chart usually revolves once in 24 hours, but in some cases the drum completes a revolution in a week.

Rainier, MOUNT, or TACOMA, one of the highest peaks of the Cascade Range (q.v.), was in eruption during part of 1894.

Rainy, ROBERT, Scottish divine, was born at Glasgow on New Year's Day 1826, the son of the professor of Forensic Medicine there. After studying at Glasgow and New College, Edinburgh, he entered upon his first charge at Huntly Free Church in 1851, but was transferred to Edinburgh by a General Assembly resolution in 1854. Some eight years later he became professor of Church History in the Free Church College, attaining the principalship in 1874. He visited Australia in 1906, but died at Melbourne on 22d December. An outstanding figure in the ecclesiastical politics of Scotland in the later 19th century, Rainy is chiefly remembered for his part in the union of the Free and United Presbyterian Churches in 1900. He was thrice moderator of Assembly. His writings, not many in number, include *Three Lectures on the Church of Scotland* (1872), being a reply to the Dean of Westminster's lectures on the subject; *The Bible and Criticism* (1878); *The Ancient Catholic Church* (1902). See Life by P. C. Simpson (2 vols. 1909).

Rainy Lake, forming a portion of the boundary line between Ontario and the United States, lies 100 miles north-west of the nearest point of Lake Superior, and is about 50 miles long. It discharges by Rainy River into the Lake of the Woods. There were gold finds on the Canadian side in 1896-97.

Raipur, a town in the Central Provinces of India, standing on a plateau (950 feet), 180 miles E. of Nagpur, has numerous tanks and groves, an old fort (1640), and a trade in grain, lac, cotton, &c.; pop. 38,000.

Rais. See RETZ.

Raised Beaches. See BEACHES (RAISED), UPRHEAVAL.

Raisins are dried grapes, used for cooking, for dessert, and in the manufacture of wines. They are produced in largest quantities in the south-eastern provinces of Spain (Málaga, Alicante, and Valencia), in Cos and Samos, and the adjacent districts on the mainland; smaller quantities are grown in Provence,

Southern Italy, the islands of the Greek Archipelago, and Crete. Currants (q.v.) are a small and peculiar variety produced in Greece, in the Morea, and the Ionian Islands. The grapes intended for raisins are dried either on the vines, after the stalks of the bunches have been partly cut through, or spread out on the ground; it is only in case of continued bad weather or persistent want of sunshine that they are dried by artificial heat. The better qualities are left on the stalks and dried in bunches; these are exported for use as dessert. All less estimable qualities are intended for cooking purposes, and, to a less extent, for the preparation of artificial wines or the improvement of wines of inferior quality. Raisins are rich in sugar, and it is this property that makes them serviceable to the manufacturers of wine. The bunches intended for table use are sometimes dipped in water upon the surface of which swims a layer of olive-oil, or in a strong potash lye. The object is to make the skin soft and give it a glossy lustre. The raisins grown in Spain are large and blue, and are known in the market as 'Malaga raisins' and as 'lexias,' the former for dessert, the latter for cooking. The raisins of Asia Minor are shipped principally at Smyrna (q.v.), and embrace the Elenic and similar varieties, which are long and light brown in colour, and sultanas, small light-brown grapes, with a thin and delicate skin and no seeds or kernels.

Rāja, or RAJAH (from the Sanskrit *rājā*, 'king,' cognate with the Lat. *reg.* of *rex*), originally a title which belonged to princes of Hindu race, who, either as independent sovereigns or as feudatories, governed a territory. Now, however, the title has a much wider extension: it is used of independent sovereigns, of subject or 'protected' princes, of petty chiefs, of great landowners, and of some persons of eminence. Malārāja is 'great prince' (*mahā rājā*). *Rānī* is a *rājā's* wife.

Rajamahendri (or *Rajamahendry*), a town of India, in the Presidency of Madras, stands on the left bank of the Godavari, 30 miles from its mouth. It has a museum, a provincial school, two gaols, and some Christian churches. From 1753 to 1758 it was held by the French. Pop. 54,000.

Rajmahal, a decayed town of India, stands on a steep eminence on the right bank of the Ganges, 170 miles NNW. of Calcutta. It was long the chief town of the Bengal and Bihar provinces, but is now deserted and ruinous, being only noteworthy for the remains of its palaces, formerly belonging to Shah Shuja and Kasim Ali, and as a station in an important transit trade. Its commercial value has been lessened in consequence of the Ganges often shifting its bed at this point. In the beginning of the 19th century it had 25,000 inhabitants, and now only about 3500.

Rajon, PAUL ADOLPHE, an etcher, was born at Dijon in 1842, and trained in Paris, partly at the School of Fine Arts. About 1865 he turned to etching, and gained immediate success with his first plate, 'Rembrandt at Work,' after Meissonier. Standing in the front rank of French etchers, he won several medals at the Salon exhibitions, and produced numerous beautiful etched portraits and plates for books. In 1872 he visited England, and published in London in 1873 a portrait of J. S. Mill after Watts, as well as in subsequent years many other plates. His greatest achievements were 'The Emperor Claudius,' a picture by Anna Tadema, the portrait of Darwin by Onless, and those of Tennyson, Joachim, and Mrs Anderson Rose by Watts. He died at Auvers-sur-Oise on 8th June 1888. See *Twelve Etchings* by P. A. Rajon, with Memoir by F. G. Stephens (1889).

Rajputana, an administrative territory of India, embracing twenty-one Indian states and the

British districts (2711 sq. m.) of Ajmere-Merwara. It lies between Sind, the Punjab, Agra and Oudh, and the native states of Central India (on the S.). Area, 131,600 sq. m.; pop. (1901) 9,723,300—less by 2½ millions than in 1891, owing to famine; (1921) 10,339,655. The most important of the Indian states are Jaipur, Jodhpur (or Marwar), and Udaipur (or Mewar); next follow Alwar, Bhartpur, Kotah, and Bikaner. This region is crossed by the Aravalli Mountains, and consists in great part of sandy, barren plains, though there are of course numerous fertile valleys and other tracts. It gets its name from the ruling race or predominant Aryan tribes, called Rajputs. They are a proud aristocracy, own the soil, and have furnished ruling dynasties to very many of the states of India. Yet in 1921 they were but 626,000 in number. At the time of the Mohammedan invasions in the 11th century the Rajputs ruled over half-a-dozen strong states—Kananj, Ajmere, Anhilwara, Udaipur, and Jaipur. From the end of the 16th to the middle of the 18th century these states acknowledged the supremacy of the Mogul emperor of Delhi. Then they were made to recognise the Mahrattas as their masters: since the Mahrattas were crushed by the British, the Rajput states are independent allies.

Rajshahi. See RAMPUTR BAULEAH.

Rákóczy March. a famous Hungarian tune. Its authorship has been variously attributed, but it is generally assumed that it was made up of camp alarms and other military calls by some musician in the service of Prince Franz Rákóczy II. (1676-1735), whose unsuccessful rebellion against the Austrians ended in exile. About 1700 the song in its original form of three 12-barred periods appeared, but it was probably not put down on paper till the end of the century. Berlioz made an audacious setting of it as 'Marche Hongroise' in his *Damnation de Faust* (1846), and Liszt transcribed it in one of his Hungarian Rhapsodies.

Rakshas. See DEMONOLGY.

Raleigh, the capital of North Carolina, is near the Neuse River, 186 miles SSW. of Richmond. The town is regularly built on an elevated site, with a central Union Square, from which four principal streets radiate, each 99 feet wide. In the square stands the capitol, a large domed building of granite. The city contains also various state institutions, colleges, iron-foundries and machine shops, and manufactures cottons, fertilisers, cars, &c. Pop. (1920) 24,418.

Raleigh, SIR WALTER, the typical gallant and hero of England's heroic age, was born of an ancient but decayed family at the manor-house of Hayes, near Badleigh in East Devonshire, probably in 1552. He was the second son of his father's third wife, who herself had been married before, and had borne her husband the famous Humphrey and Adrian Gilbert. He entered Oriel College, Oxford, about 1566, but left without a degree, most probably in 1569, to volunteer into the Huguenot cause in France. Here he served his apprenticeship to arms, but, beyond the fact that he was present at Montcontour, we know little of this period of his life. In 1578 he joined Humphrey Gilbert's luckless expedition, having most probably already crossed the Atlantic; and early in 1580 he landed in Cork at the head of a troop of one hundred foot to act against the Irish rebels. He quickly attracted notice by his dash and daring, took part in the assault of the fort at Smerwick and subsequent massacre of the six hundred Italian and Spanish prisoners, and seems to have approved thoroughly of all the drastic measures taken by the government to stamp out rebellion. He saw some months of

further hard and thankless service in Munster, but in December 1581 returned to England.

He now made his entry to the circle of the court as a protégé of the favourite Leicester, and in February 1582 accompanied him in his convoy of the Duc d'Alençon to the Netherlands. Almost immediately after his return he became prime favourite of the queen, whose heart was still susceptible despite the weight of almost fifty years. Fuller's well-known story of how he first caught her eye by flinging down on the ground his fine plush cloak to save her feet from the mire is most likely completely apocryphal, but well befits the romantic temper of the times and the manner of fantastic devotion with which the Virgin Queen loved to be wooed or worshipped by the fine gentlemen of her court. Raleigh was now in the prime of manly beauty; his tall and handsome figure, dark hair, high colour, lofty forehead, resolute and manly bearing, alert expression, and spirited wit combined to form an imposing personality, and all the advantage that nature had given him he heightened by a gorgeous splendour in dress and in jewels. But he was proud, haughty, and impatient, and everywhere, save in his native Devonshire, the broad accent of which he preserved all his life, he made himself a multitude of jealous and envious enemies. He was consulted confidentially on high affairs, but never to the last took a public place in the queen's counsels, perhaps because his royal mistress, with all her fondness, distrusted his ambition, and divined that he lacked that sagacity of the statesman which she recognised in the less splendid Burghley and Walsingham. The playful name of 'Water' by which she called him seems itself to imply a recognition of that instability of character which was his constant foible and, in the fullness of time, the occasion of his ruin. But meantime she heaped her favours lavishly upon him: in April 1583 he received two estates; next month the 'farm of wines,' a license duty of twenty shillings a year from every vintner in the kingdom, which at one time yielded £2000 a year; and in March 1584 a grant of license to export woollen broadcloths, which Burghley estimated had yielded him in the first year as much as £3950. About the close of 1584 he was knighted; in July 1585 he was appointed Lord Warden of the Stannaries, in September Lieutenant of Cornwall, in November Vice-admiral of Devonshire and Cornwall; and in the same year he was elected to parliament as one of the two county members for Devonshire. In 1587 he succeeded Sir Christopher Hatton as Captain of the Queen's Guard. During the summer of 1584 he leased of the queen the stately mansion of Durham House, spent much money on its repair, and kept it as his town-house from that time down to 1603. It was not till about the beginning of 1592 that he came into possession, on a ninety-nine years' lease, of the splendid park and castle of Sherborne alienated from the see of Salisbury.

In 1583 Raleigh risked £2000 in Sir Humphrey Gilbert's last ill-fated expedition, and on the news of his half-brother's loss took up a fresh charter of discovery and colonisation. In April 1584 he sent out a fleet under Amadas and Barlowe to explore the coast north of Florida. They made a prosperous voyage, and formally took possession of a district to which Elizabeth was pleased to give the name Virginia. Next year Raleigh fitted out a stronger expedition under Ralph Lane and Sir Richard Grenville, but the hundred men who lived a year under Lane's command on the island of Roanoke returned to England in Drake's fleet completely dispirited with their hardships. Soon after they set sail, Sir Richard Grenville arrived with three ships, and left on the island fifteen men well furnished with stores. One of the hundred

colonists—the first citizens of America—Thomas Hariot, in his account of the colony and the causes of its failure, speaks of the herb, 'called by the inhabitants *Ypponoe*,' which was destined to become one of the closest comforts of life to half the world. Raleigh himself took to the new luxury, and would enjoy it in pipes of silver, the queen sitting by him while he smoked. In May 1587 he sent out three ships, under Captain Charles White, with 150 colonists, seventeen of whom were women. They found the fifteen men had perished, and ere long misfortune after misfortune overtook themselves. White returned to England for supplies, and at length, after many delays and difficulties, reached Virginia in August 1590 to find the settlement ruined and the colonists dispersed, never afterwards to be seen. It was the last direct attempt of Raleigh himself at the colonisation of Virginia. The undertaking, says Hakluyt, 'required a prince's purse to have it thoroughly followed out—it is supposed that Raleigh himself had spent forty thousand pounds upon it.'

Already in May 1587 the appearance of the handsome young Earl of Essex at court had endangered Raleigh's paramount place in the favour of the queen. Hatton and Leicester long ere now had shown their jealousy of him, but this impetuous and petulant boy openly flouted him, and at length drove him from the court to Ireland. He had already received in the spring of 1587 a grant of 42,000 acres in Munster, and with characteristic vigour he at once set about reaping the fruit with English settlers. He was in Ireland when the Invincible Armada appeared in English waters, but he hastened to the south of England to superintend the coast defence, and he was present with the fleet a trusted counsellor throughout that glorious week of toil and triumph. His vessels scoured the seas in privateering enterprises, which gratified at once his inborn hate of Spain and helped to provide the means for his vast expense and his Virginian ventures. His over-zealous sea-men sometimes transgressed the forbidden limit of piracy, but the Treasury winked at such accidents or made itself a receiver by claiming a share of the plunder. Raleigh sailed with Drake on his Portugal expedition of 1589, but by the autumn of that year was again in Ireland, where he quickly became a warm friend of Spenser, with the endless fame of whose great poem his name is imperishably linked. The poet had settled on his estate at Kileohann three years before, and here the 'Shepherd of the Ocean' (Raleigh) visited him, and read him his poem of *The Ocean's Love to Cynthia* (Elizabeth), which Sir Edmund Gosse thinks must have contained at least 10,000 lines, the extant 130 stanzas being a fragment. In *Colin Clout's Come Home Again* we read how Raleigh carried the poet into the presence of the queen, who took delight to hear his poem, and commanded it to be published. In his Yonghul garden during this breathing-space Raleigh planted tobacco, as well as the first potatoes that grew on Irish soil. He quickly recovered all his influence at court, and busied himself with further schemes for reprisals on the Spaniards down to the moment of his fall. His famous tract, *A Report of the Truth of the Fight about the Isles of the Azores this last Sommer*, appeared anonymously in 1591. It is a splendid piece of heart-stirring prose, and three hundred years later it gave the inspiration to Tennyson's noblest ballad. Early in 1592 Raleigh prepared a new expedition to seize the Spanish treasure-ships, but again his dotting mistress forbade him to sail with the fleet, which he had reluctantly to entrust to Frobisher and Sir John Borough. Hardly had he returned before she seems to have discovered his intrigue with

Bessy Throckmorton, one of her own maids-of-honour—an infidelity to her own supremacy which her jealous temper could not brook. In July 1592 Raleigh was committed to the Tower, and it was more than four years before he was again admitted to his mistress' presence. He bore his imprisonment with characteristic impatience, and vexed the air with exaggerated complaints of his loss expressed in the fantastic fashion of the time. Meantime Borough had captured the *Madre de Dios*, a huge carrack, which he brought into Dartmouth in September. So great was the excitement and such the rapacity of the vultures that gathered to the spoil that none but Raleigh could control the tumult. He was sent down to Dartmouth with a keeper, and Sir Robert Cecil describes with astonishment his popularity and influence among his sailors and his countrymen. 'But his heart is broken,' he writes his father, 'for he is extremely pensive longer than he is busied, in which he can toil terribly.' Raleigh now married Bessy Throckmorton, and for the next two years lived with her in quiet happiness, building and gardening at Sherborne. About 1593 his imagination seems first to have been fired by the descriptions of Guiana, with its vast city of Manoa and its El Dorado, and in 1594 he sent out Captain Whiddon to Trinidad to make inquiries for him. In February 1595 he himself sailed with five ships, explored the coasts of Trinidad, sailed up the Orinoco, and had his imagination set aglow for life by the tropical splendours of vegetation that he saw, and still more by the auriferous quartz and glittering stones he found, and marvellous stories of stores of gold beyond brought to him by the native Indians. Six months after his return he sent Captain Lawrence Keymis to make further explorations, and later Captain Berry, but he himself failed to rouse any great public interest in England in his splendid dream of a new world and untold wealth from the mines of Guiana. Early in 1596 he published *The Discovery of the large, rich, and beautiful Empire of Guiana* (Hakluyt Society, edited by Sir R. Schomburgk, 1848), a splendid piece of vigorous prose. In June 1596 he sailed in the expedition under Howard and Essex to Cadiz, and it was his advice that governed the whole plan of action in that splendid triumph which a second time shattered the naval strength of Spain. His faults ever fell from him in the hour of action, but never before or again in life did he show such tact and temper as in the skilful persuasions by which he forced the Lord Admiral and Essex to agree to his plans. Yet he was mortified to the heart, as he lay in his ship suffering from a wound in the leg, when their lack of energy allowed the Spaniards, two days later, to burn the whole fleet of treasure-laden carracks before his eyes. His spirited *Relation of Cadiz Action* remains the best history of the exploit. Despite his heroic conduct, it was almost the midsummer of 1597 before Raleigh was again admitted to court and allowed to take up his place as Captain of the Guard. Cecil showed himself friendly to him, and Essex was glad of his support in his desire for a more active opposition to Spain. Raleigh at once set himself to prepare and victual ships for the projected expedition, which at length, in July 1597, was permitted by the queen to set sail from Plymouth. A desperate storm compelled many of the ships to put back for shelter, but at length Raleigh met Essex off the island of Flores. They agreed to attack together the Isle of Fayal, and Essex sailed off first, but Raleigh reached the harbour before him, and, after waiting three days, on the fourth landed his men and carried the town by storm. Next morning the squadron of Essex made the harbour, to find all the laurels of the 'Island Voyage' already reaped. Essex's mortification was

great, and was made greater by his cold reception at home. His surly temper grew upon him, and soon his helpless failure in dealing with Tyrone's rebellion in Ireland and his insane attempt at an insurrection in the streets of London brought him to the block. His hatred of Raleigh had become so desperate that he charged him, together with Cecil and Cobham, with a plot to murder him in his house—an absurd accusation, which Sir Christopher Blount on the scaffold confessed was 'a word cast out to colour other matters.' In 1600 Raleigh succeeded Sir Anthony Paulet as governor of Jersey, and in his three years' rule did much 'to foster its trade and relieve its fiscal burdens. About this time also he was active in parliament, advocating freedom of tillage, and of church-going, and the repeal of the more vexatious monopolies. His Irish estates he sold in 1602 to Richard Boyle.

In the dark intrigues about the succession that filled the closing years of Elizabeth's reign Raleigh took little part, while the crafty Cecil and the faithless Lord Henry Howard got the ear of James, and for their own advantage poisoned his mind against Raleigh and Cobham. The king had long been an admirer of Essex, and no doubt knew from the beginning that Raleigh was indifferent to his cause. The cowardice, timid love of peace, and the whole personal habits of the royal potent, as well as his overweening conceit of his own judgment in affairs of state, were all naturally repugnant to the bold, self-reliant hero who had so long been a trusted confidant of the great-hearted queen. He met James on his southward progress at Burghley in Lincolnshire, and was greeted with a wretched pun worthy of its source—'On my soul, man, I have heard but *rawly* of thee.' Ere long he was stripped of, or forced into resigning, all his offices, the captaincy of the Guard, the wardenship of the Stanaries, the wine-license monopoly, the governorship of Jersey. All this must have cut Raleigh to the heart, and as he was at no time guarded in his tongue it is possible enough he may have in his haste spoken, or at least listened to, words expressing a preference for Arabella Stuart to the rule of the Scottish king. But the only witness against him was the miserable Lord Cobham, and he made and unmade his eight several charges with such facility as to make them of no value at all. Neither in the 'Main' nor the 'Rye' Plot was there any really adequate evidence of Raleigh's complicity, and the refusal of the crown to allow him to be confronted with his accuser is of itself almost enough to justify belief in his innocence. 'But one thing,' says Kingsley, 'comes brightly out of the infinite confusion and mystery of this dark Cobham plot, and that is Raleigh's innocence.' Raleigh was arrested on the 17th July, and in his first despair tried to kill himself. The trial began at Winchester on November 17th, the prosecution conducted by the attorney-general, Sir Edward Coke, who disgraced his robe by a brutality almost beyond belief. Raleigh's defence was splendid, and for the first time in his life he made his way into the hearts of all Englishmen by the dauntlessness of his bearing and the burning eloquence of his words. Coke could call him 'a monster,' 'a viper,' 'the rankest traitor in all England,' 'damnable atheist,' and 'a spider of hell,' and Chief-justice Popham could jeer at him as an atheist as well as traitor; but it was too much for Englishmen to believe that the hero of Cadiz and of Fayal had 'a Spanish heart,' and all his unpopularity fell from him from that hour. Dudley Carleton, who heard the trial, wrote that when it began he would have gone a hundred miles to see Raleigh hanged, but ere it was closed he would have gone a thousand to save his life. Yet he was condemned to death, and only on the scaffold was his sentence commuted to perpetual im-

prisonment. Slierborne he had conveyed to trustees for his wife and eldest son, but an invalidity in the deed of conveyance was soon found, and the unhappy wife's application to the king was met with the words, 'I maun hae the lord, I maun hae it for Carr.' In January 1600 it was given to the favourite, a payment of £8000 being made as compensation. Within the Tower Raleigh employed himself with study and with chemical experiments, and was treated on the whole with fair indulgence. The young prince Henry came often to him, for he greatly admired the noble captive: 'No man but my father would keep such a bird in a cage,' said he. But he died in November 1612, and the promise he had wrung from his father to release Raleigh the next Christmas was only remembered to be forgotten. The chief fruit of Raleigh's imprisonment was his *History of the World*, the first and only volume of which, extending to over 1300 folio pages, although coming down but to the second Roman war with Macedonia (170 B.C.), was published in 1614. It is written throughout in admirable English; but the preface is the most interesting portion, for the subject itself is dreary, though lightened by glimpses of autobiography and occasional flashes of fire—scorching satire wrapped in ambiguous phrase. Its sale was suppressed in January 1615 as 'too saucy in censuring the acts of kings.' Oliver Cromwell, writing to his son Richard, in 1650, says, 'Recreate yourself with Sir Walter Raleigh's *History*: it is a body of history, and will add much more to your understanding than fragments of story.' The book was written for the young prince, and his death took from the author all heart to complete his work. Other writings of Raleigh's captivity were *The Prerogative of Parliament* (written 1615, published in 1628), which must have grieved the king still further; *The Cabinet Council*, published by John Milton in 1658; *A Discourse of War*, one of his most perfect pieces of writing; and *Observations on Trade and Commerce*, an appeal for free trade, suppressed like the rest.

On January 30, 1616, Raleigh was released from the Tower through the influence of Sir Ralph Winwood and Villiers, expressly to make preparations for an expedition to the Orinoco in search of a gold-mine which he maintained existed there. He engaged not to molest the dominions of the king of Spain, but he had been brought up on the old Elizabethan theory of no peace beyond the line, and doubtless he thought he had everything to gain and nothing to lose by a desperate venture, and that the gold he would bring home would gild over any formal breach of his promise. It seems difficult to understand how James can have expected that such an expedition could be made without a collision with Spain, and we find that he was careful to give himself the cowardly safeguard of allowing Raleigh to go with his old sentence still hanging over his head, as well as communicating his route to Gondomar, the Spanish ambassador. And so in April 1617 the hero sailed to the doom which fate was weaving for him, while James even then was drawing into ever closer relations with Spain, and beginning his negotiations for the Spanish marriage. Before sailing Raleigh asked leave, but in vain, to make an attack on Genoa, an ally of Spain. His small fleet was manned, some forty gentlemen excepted, by 'the very scum of the world, drunkards, blasphemers.' Storms, desertion, disease, and death followed them from the first, and ere they reached the mouth of the river Raleigh was himself stricken down by sickness and compelled to stay behind with the ships, and entrust the command of the party who went to seek the mine to Keymis. He did not give his men distinct orders to avoid fighting with the Spaniards, and when they found in their way a new Spanish town,

San Thomé, they attacked it and burned it down, but never reached the mine. In the fight young Walter Raleigh was struck down, as he shouted the words, 'Come on, my men! This is the only mine you will ever find.' Keyms lost control of his men, and came sadly back to his admiral, whose bitter reproaches made him drive a knife into his heart. The men now refused to return with Raleigh to the mine, whereupon he asked them if they would follow him in an attack on the Mexican fleet, telling them in his desperation that he had in his possession a commission from France. At length, on the 21st of June 1618, he arrived at Plymouth with his ship, the *Destiny*, alone and utterly cast down. His kinsman Sir Lewis [Judas] Stukely was sent to bring him up to London; at Salisbury on the way he feigned illness to gain four days' time to write his touching *Apology for the Voyage to Guiana*. Surrounded by a ring of spies, chiefest among whom was Stukely, he again intrigued for an escape to France, but was betrayed at every step. James dared not allow him to appear before the council of state, but had him formally examined before a commission of six, among them Coke, Archbishop Abbot, and Bacon, besides resorting to the infamy of sending a spy to gain his confidence and discover his secrets. In his perplexity Raleigh damaged his cause by contradictory statements and confessions, and his judges seem to have convinced themselves that he had never had any intention to find the mine at all, as appears from the *Declaration of the Demeanour and Carriage of Sir Walter Raleigh*, a feeble statement, though drawn up by the master-hand of Bacon. He was condemned to die the next morning (29th October 1618) on the old sentence, and neither the entreaties of the queen nor his own moving eloquence could save his life. 'You will come to-morrow morning,' he said to an old friend he met on his way back to prison; 'I do not know what you will do for a place. For my own part, I am sure of one.' One of his kinsmen warning him that his enemies would take exception at his high spirits, 'It is my last mirth in this world,' said he; 'do not grudge it to me. When I come to the sad parting, you shall see me grave enough.' His high courage never left him to the last. He wrote some verses the night before, and, says Dean Tounson, 'he ate his breakfast heartily, and took tobacco, and made no more of his death than if it had been to take a journey.' Of the cup of sack brought him he said, 'It is good drink, if a man might stay by it. The speech he made on the scaffold was masterly in its persuasive eloquence—'as he stood there in the cold morning air,' says Gosse, 'he foiled James and Philip at one thrust, and conquered the esteem of all posterity.' He asked to see the axe, and touched the edge with the words, 'This gives me no fear. It is a sharp and fair medicine to cure me of all my diseases.' To some one who objected that he ought to lay his head toward the east he answered, 'What matter how the head lie so the heart be right,' than which, as Gardiner well says, no better epitaph could be found for Raleigh's tomb.

The best edition of Raleigh's works is that in 8 vols. published at Oxford in 1829, with the 18th-century Lives by Olys and Birch prefixed. Sir Egerton Brydges edited the Poems in 1814. See Dr T. N. Brushfield's Bibliography (1908). There are Lives by Cayley (1805), Tytler (1833), Mrs Thomson (1830), Edward Edwards (the fullest, vol. i., life; vol. ii., letters, 1808), J. A. St John (1808), Louise Creighton (1877), Sir Edmund Gosse (1886), William Stebbing (1892), Martin Hume (new ed. 1907), Sir Rennell Rodd (1904), H. de Séllincourt (1908). Kingsley's glowing essay in *Miscellanies* is excellent; so also is the treatment in Sir Sidney Lee's *Great Englishmen of the 16th Century* (1904) and S. R. Gardiner's History.

Raleigh, SIR WALTER, critic, was born on 6th September 1861 at London, educated at University College there, and at King's College, Cambridge. After professorships at Liverpool (1890-1900) and Glasgow (1900-4), he was professor of English at Oxford from 1904. He died 13th May 1922. His works include numerous essays, also *The English Novel* (1894), *Style* (1897), *Wordsworth* (1903), *The English Voyagers* (1904), *Shakespeare* (1907), *Romance* (1917), *Some Authors* (1923). He combined great charm of manner with culture and scholarship. His boyish gusto for life and adventure drew him somewhat away from literature. Latterly his professorship grew irksome to him, and a more congenial activity was the writing of an unfinished official history of *The War in the Air* (vol. i. 1922).

Ralston, WILLIAM RALSTON SHILDEN, Russian scholar and folklorist, was born in 1828 of Scottish ancestry—his surname originally Shelden. He studied at Trinity College, Cambridge (1846-50); was called to the bar at the Inner Temple in 1862, but never practised; and from 1853 to 1875 held a post in the library of the British Museum. He translated his friend Turgenev's *Liza* (1869), and wrote on Russian folklore and history. He died in London, 6th August 1889.

Ram, a ship intended to run into and sink an enemy's vessel, and for this purpose provided with a heavily armoured stem projecting below the water-line in the form of a beak. Rams at first had a separate rating in the British navy. They were first employed during the American civil war in Norfolk roads in 1862, when the Federal frigate *Cumberland* was rammed and sunk by the Confederate armour clad ram *Virginia*. Torpedoes have made the rushing of vessels at one another a much more dangerous policy than of yore; ramming is now an exceptional method, but during the Great War it was often resorted to for the destruction of submarines, especially by boats of the destroyer class. See TACTICS (NAVAL).

Rāma, in Hindu mythology, is usually the name of the hero of the Rāmāyana (q.v.), but is applied also to his older rival, also regarded as an incarnation of Vishnu (q.v.), Parāśrāma, and to Balarāma, brother of Krishna.

Ram'adan, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course, from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spittle, are strictly prohibited during that period. Even when obliged to take medicine the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence in all sorts of enjoyments. The fast of Ramadan, now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of midsummer. The sick, travellers, and soldiers in time of war are temporarily released from this duty, but they have to fast an equal number of days at a subsequent period when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious are expressly exempt from fasting. The principal passages treating of the fast of Ramadan are found in the second Surah of the Koran, called 'The Cow.'

Rāmāyaṇa is the name of the second of the two great epics of India. Unlike the *Mahābhārata* (q.v.), it is, as regards books ii.-vi., essentially the work of a single poet, Vālmīki, and reveals marked unity of conception and style. The poet has combined two wholly different legends into a single theme; the first is a tale of court intrigue, showing how Dasaratha, king of Ayodhya, is forced, in order to keep a rash promise to Kaikeyi, his second wife, to disinherit his eldest son Rāma in favour of Bharata, her child, and how Rāma goes into banishment in the forest, accompanied by his true wife, Sītā, and his youngest brother, Lakṣmaṇa. The second tells of the rape of Sītā by a demon, Rāvāṇa, lord of Lankā—later identified with Ceylon, but originally quite distinct, and her rescue and the slaying of Rāvāṇa by Rāma, who is aided by a host of monkeys under Hanumat and Sugriva; here we are in the region of myth brought down to earth; in the late Vedic literature Sītā is the goddess of the ploughed field, and Rāma's overthrow of Rāvāṇa, with Hanumat's aid, is a reflex of Indra's victory over Vritra, demon of drought, with the aid of the wind-gods, for Hanumat is son of the wind-god. In the later books, i. and vii., Rāma appears as identified with Viṣṇu as the supreme deity, but this is unknown to Vālmīki. The date of the poem is uncertain. H. Jacobi assigned it to the 6th century B.C., but more probably it falls in the 4th century. While it is not as old as the main story of the *Mahābhārata*, it is unquestionably long anterior to the definite reduction of that text. Its influence on later Indian poetry has been predominant; Vālmīki established the norm of the Śloka metre (verses of two lines each of sixteen syllables), of which tradition makes him the inventor, and displays many of the characteristics which are developed in later Sanskrit poetic style; his brilliance of description, command of pathos, love of nature, and dignity vindicate for Vālmīki a high rank as a poet, while his noble conception of Rāma has deeply influenced religious belief and worship, and has inspired the greatest epic of medieval Hindustan, the *Rām Charit Mānās* of Tulsī Dās (1532-1624), which inculcates an ideal standard of purity and virtue.

Nominally composed, in its final form, of 24,000 Ślokas, arranged in seven books, the *Rāmāyaṇa* has come down in several varying texts, representing the changes made during the process of tradition, often oral, in different parts of India; thus a Bengal, a Bombay, a West Indian, a Kashmirian, and a North-west Indian recension may be distinguished; all are probably of considerable antiquity, the West Indian and the Bombay versions having existed by 800 A.D. at least.

The *Rāmāyaṇa* has been repeatedly edited in India; an Italian version of the Bengal recension by G. Gorresio, with text, appeared in 1843-58; an English version of the Bombay recension by E. T. H. Griffith appeared in 1870-75. See also A. Weber, *Ueber das Rāmāyaṇa* (1870); H. Jacobi, *Das Rāmāyaṇa* (1893); A. Ludwig, *Ueber das Rāmāyaṇa* (1894).

Rambouillet. CATHERINE DE VIVONNE, MARQUISE DE, one of the most accomplished and illustrious women of the 17th century, was born at Rome in 1588. Her father was Jean de Vivonne, afterwards Marquis de Pisani; her mother, Julia Savelli, belonged to an old Italian family, and through her mother was connected with the Florentine banking house of Strozzi. At twelve Catherine was married to Charles d'Angennes, son of the Marquis de Rambouillet, who succeeded to the family estates and title on the death of his father in 1611. From the very beginning she disliked alike the morals and manners of the French court, and she early determined to gather round herself

a select circle of friends. At once virtuous, spiritual, sympathetic, and appreciative, she gathered together in the famous Hôtel Rambouillet for a long series of years all the talent and wit of France, and in her salon met for the first time on an equal footing the aristocracies of rank and of *esprit*. For fifty years she received the wits, critics, scholars, and poets of Paris: Malherbe, Racan, Balzac, Voiture, Corneille, Ménage, Chapelain, Scarron, Saint-Evremond, Benserade, La Rochefoucauld. But half of the glory of the Hôtel belonged to the brilliant women who frequented it, among them Mademoiselle de Scudéry, the beautiful Duchesse de Chevreuse, the Marquise de Sablé, who inspired the *Maximes* of La Rochefoucauld, Mademoiselle de la Vergne, afterwards Madame de La Fayette, the inimitable Madame de Sévigné; but conspicuous beyond all by her splendid beauty and faultless grace, the idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde—the Duchesse de Longueville. As the centre of this group reigned the Marquise de Rambouillet—‘la grande Marquise,’ ‘the divine Arthénice’—and her beautiful daughter Julie (the Parthénice of *Célie*), after fourteen years of suitor, wife of the Duke of Montausier, who presented her with the famous *Garden of Julie*, a collection of love-verses, illustrated with exquisite paintings on vellum.

The frequenters of the Hôtel were celebrated for the elegance of their manners and the refinement of their language; but the latter, on the lips of imitators, degenerated into extravagant affectation and palpable pedantry—a mark for the comic satire of Molière in *Les Précieuses Ridicules* and *Les Femmes Savantes*. It must be remembered that the title *Précieuse* originally meant ‘distinguished’ in its best sense, and that the ladies of the coterie a generation before had been proud to wear it. Madame de Rambouillet's good taste in everything was conspicuous, and she led the fashion also in the decoration of houses. Her famous ‘Chambre bleue,’ furnished with blue velvet relieved by gold and silver, with large windows from floor to ceiling, and her alcove with its *ruelle*—at first adopted merely to save her from the heat of the fire, which she could not bear—were imitated in many a great house in France. Her importance declined under Louis XIV., who distrusted clever women, but she survived till December 1665.

See the *Historiettes* of Tallemant des Réaux and the *Dictionnaire des Précieuses* of Soumaize; Roderer's *Mémoire pour servir à l'Histoire de la Société polie en France pendant le Dix-septième Siècle* (1834); Victor Cousin's *Jeunesse de M^{de} de Longueville, M^{de} de Sablé, &c.*; Lavet's *Précieuses et Précieuses* (1859); Brunetiere's *Nouvelles Études Critiques* (2d ed. 1886); F. Magne's *Voiture et les Origines de l'Hôtel Rambouillet* (1912).

Rameau. JEAN PHILIPPE, a French musician, was born at Dijon, 25th September 1683. At eighteen he went to Milan, but soon returned to France, to Paris, Lille, and Clermont in Auvergne. Here he acted as organist to the cathedral, and wrote his *Traité de l'Harmonie* (1722). Removing to Paris, he published *Nouveau Système* (1726), *Génération Harmonique* (1737), and *Nouvelles Réflexions* (1752). In 1733, at the mature age of fifty, he produced his first opera, *Hippolyte et Aricie*, the libretto of which was written by the Abbé Pelleguin. It created a great sensation, and Rameau was forthwith elevated to the rank of a rival to Lully (see OPERA). Rameau's best opera was *Castor et Pollux*, produced at the Académie Royale de Musique in 1737. Between 1733 and 1760 he composed twenty-one operas and ballets, as well as numerous harpsichord pieces. Louis XV. created for him the office of composer of chamber music, granted him letters of nobility, and named

him a Chevalier de St Michel. Rameau died 12th September 1764. See A. Pougin's essay (Paris, 1876).—Rameau's nephew, well known as giving the title to a singular dialogue of Diderot's, which Goethe thought worthy of translation into German, had actual existence, being Louis Sébastien Mercier (1740-1814), author of the famous *Tableau de Paris*.

Ramée, DE LA. See RAMUS, and OUIDA.

Rameses, the name of several Egyptian monarchs, of whom two, the first and the second, were specially famous (see the article EGYPT). Some have identified the warrior king Rameses II. with the Pharaoh of the oppression, and Rameses III. with the Pharaoh of the Exodus, though there is some difficulty in the identification (see EXODUS, JEWS). The mummy of Rameses II. was found at Deir-el-Bahari in 1831, that of Rameses III. at Bulak in 1886. The story of Rhampsinitus (q.v.) seems to refer to Rameses III. For the treasury-city called Rameses, see PITHOM.

Ramle. See BEHMERIA.

Ramillies, a village of Brabant, Belgium, 14 miles by rail N. of Namur, is memorable as the place near which, on 23d May 1706, the French forces under Marshal Villeroi and the Elector of Bavaria were defeated by Marlborough, with the loss of almost all their cannon and baggage, and thirteen thousand killed and wounded. This victory compelled the French to give up the whole of the Spanish Netherlands.

Rammohun Roy. Rājā Rām Mohān Rāi, founder of the Brahma Samāj (q.v.), was born at Radhanagar in Bengal in May 1772, his ancestors being Brahmans of high birth. He studied Persian, Arabic, and Sanskrit, and soon began to doubt the foundations of the ancestral faith. He spent some time studying Buddhism in Tibet, and gave offence there by his frank criticisms. He incurred the enmity of his family for his religious views, and lived at Benares till 1803. For some years he was revenue collector in Rangpur. In 1811 he succeeded to affluence on the death of his brother. He published various works in Persian, Arabic, and Sanskrit, the object of the whole being the uprooting of idolatry. His influence was powerful in securing the abolition of suttee. He also issued in English an abridgment of the *Vedānta*, giving a digest of the Vedas, the ancient sacred books of the Hindus. In 1820 he published *The Precepts of Jesus, the Guide to Peace and Happiness*, accepting the morality preached by Christ, but rejecting belief in his deity or in the miracles, and wrote other pamphlets hostile both to Hinduism and to Christian Trinitarianism. In 1828 he began the association which grew into the Brahma Samāj, and in 1831 visited England, where he was received with all but universal friendliness and respect. He took a lively interest in the Reform agitation, and gave valuable evidence before the Board of Control on the condition of India, but overtasked himself, and died at Bristol, 27th September 1833.

See Miss Carpenter's *Last Days of Rammohun Roy* (1866); the fuller Bengali memoir (1881); his English works, edited by Jogendra Chunder Ghose (1888); and Dinesh Chandra Sen's *History of Bengali Language and Literature* (1912).

Ramnagar, two towns of India: (1) a town of the United Provinces of Agra and Oudh, stands on the right bank of the Ganges, 2 miles above Benares. It contains a palace, the residence of the raja of Benares, which rises from the banks of the sacred stream by a number of fine ghāts or flights of stairs. There is a fort, and whips and wicker-work chairs are manufactured. Pop. 10,000.—(2) A town of the Punjab, on the Chenab River, 28 miles NW. of Gujranwala. It was a place of great importance in the 18th century, being then known as Rasul-

nagar, but was stormed by the Sikhs under Ranjit Singh in 1795, and its name changed to Ramnagar. It is now a place of 4600 inhabitants. The opening of the Sind-Sagar Railway has practically ruined its trade.

Rampart forms the substratum of every permanent fortification; see FORTIFICATION.

Ramphastida. See TOUCAN.

Rampion (*Campanula Rapunculus*; see CAMPANULA), a perennial plant, a native of Europe, rare in England, with a stem about two feet high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovate-lanceolate and waved. The root is white and spindle-shaped, and was formerly much used for the table, under the name of *Rampion* or *Ramps*. The plant is now little cultivated in Britain, but is still commonly grown in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

Rampion
(*Campanula Rapunculus*).

Rampur, the capital of an Indian state in the United Provinces of Agra and Oudh, on the river Kosila, 110 miles E. by N. of Delhi, manufactures damask, pottery, sword-blades, and jewellery; pop. 73,000.—The *state*, entirely surrounded by British territory, has an area of 900 sq. m. and a pop. of 453,600.

Rampur Bauleah, chief town of the Rajshahi district (area, 2600 sq. m.) of Bengal, on the north bank of the Ganges, is a centre of silk and indigo trade, and has an English Presbyterian mission; pop. 24,600.

Ramsay, ALLAN, Scottish poet, was born in the parish of Crawford, Lanarkshire, 15th October 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. At fourteen he was put apprentice to a wigmaker in Edinburgh, and followed that calling till his thirtieth year, by which time he had become known as a poet, having issued several short humorous satires and realistic descriptions which were printed as broadsides, and sold in his shop or on the street for a penny each. He had also written (1716-18) two additional cantos to the old Scots poem of *Christ's Kirk on the Green*, felicitous pictures of rustic life and broad humour. Ramsay now abandoned wig-making, and commenced business as a bookseller in the High Street, with a sign of Mercury over his door. Later he removed to the Luckenbooths, and there flourished under the heads of Drummond and Ben Jonson, adding to his business a circulating library—the first established in Scotland. Down to 1755, when he retired to a villa of his own erection, 'honest Allan's' career, worldly and literary, was eminently prosperous. Neither Puritan nor profligate, social in his instincts, yet careful and industrious, Ramsay never allowed his pride and vanity as a poet to withdraw him from business. One brief cloud overcast the poet's successful career. He built a theatre in Edinburgh at his own expense, which was almost immediately shut up by the magistrates, in virtue of the act passed in 1737 prohibiting all dramatic exhibitions without special licence. Besides his loss he suffered

much from the attacks of the churchmen of the day. His application to Lord Advocate Forbes for 'some canny post' was unsuccessful; yet his misfortunes had left him a decent competency, and he spent the last two or three years of his life in cheerful retirement in the quaint but picturesque octagonal house he had built on the north side of the Castle Hill, and here he died 7th January 1758. He had the gratification of seeing his only surviving son, Allan Ramsay (1713-84), fast rising into distinction as a portrait-painter; in 1767 he was appointed principal painter to the king. A complete edition of the elder Allan's poems with a biography was published by Chalmers (1800); a fine edition, with the music of the songs, and engravings by David Allan, in 1788. A good selection is that by J. Logie Robertson (1887). A monument to Ramsay by Steell was erected in Edinburgh in 1865.

The following are his principal works: *Tartana, or the Plaid* (1721); a collected edition of his *Poems*, published by subscription in 1721, by which it is said the poet realised 400 guineas; *Fables and Tales* (1722); *Fair Assembly* (1723); *Health, a Poem* (1724); *The Tea-table Miscellany*, a collection of the most choice songs, Scottish and English (1724), to which a second volume was published in 1725, a third in 1727, and a fourth in 1740; *The Evergreen*, 'being a collection of Scots Poems wrote by the Ingenious before 1600,' published in 1724; *The Gentle Shepherd, a Pastoral Comedy* (1725); a second collection of *Poems* (1728); *Thirty Fables* (1730). See the Life by Oliphant Smeaton ('Famous Scots,' 1896); and Mackail in *Essays and Studies*, vol. x. (Engl. Ass. 1924).

Ramsay, Sir Andrew Crombie (1814-91), born in Glasgow, joined the Geological Survey in 1841, became director-general in 1871, and in 1881 retired with a knighthood. See Life by Sir A. Geikie (1895).

Ramsay, Edward Bannerman Burnett (1793-1872), born in Aberdeen, was a son of the sheriff of Kincardine, a Burnett of Leys, who inherited an uncle's estates and took the name of Ramsay. Young Ramsay took a poll degree at St John's College, Cambridge; became a curate in Edinburgh in 1824, and in 1830 incumbent of St John's there; and in 1846 he was appointed dean of the diocese. Dean Ramsay was practically founder of the Representative Church Council of the Scottish Episcopal Church. He published several theological treatises and memoirs, but is best known for his *Reminiscences of Scottish Life and Character* (1857-61).

See the Memoir, by Cosmo Innes, prefixed to the 22d ed. (1874).

Ramsay, William (1806-65), a son of the baronet of Bamff in Perthshire, was professor of Humanity at Glasgow, and wrote a manual of *Roman Antiquities*, long a standard work.—His nephew, Sir James Henry Ramsay (1832-1925), born at Versailles, wrote *Leicester and York*, and other important works on English history.

Ramsay, Sir William, K.C.B., F.R.S., born at Glasgow in 1852, a nephew of the geologist Sir Andrew Ramsay, was professor of Chemistry, and later principal, at University College, Bristol, and in 1887-1912 professor at University College, London. With Lord Rayleigh he discovered Argon (q.v.), obtained helium, and discovered afterwards neon, krypton, and xenon. He wrote on the gases of the atmosphere, on radium, and on chemistry generally. He died 23d July 1916. See Life by Tilden (1918).

Ramsay, Sir William Mitchell, born at Glasgow in 1851, studied at Aberdeen, Oxford, and Göttingen, was professor of Humanity at Aberdeen in 1886-1911. He travelled much in Asia Minor, wrote on the geography and antiquities of the region, on early Christian history there, and especially on St Paul and his labours in that region.

He and his wife have also written on Turkish life and Turkish policy.

Ramsbottom, a manufacturing town of Lancashire, on the Irwell, 4 miles N. of Bury. The first Sir Robert Peel established calico-printing here, and it now has iron and brass foundries and manufactures of cottons, calicoes, ropes, machines, &c. Pop. (1861) 4134; (1881) 16,142; (1921) 15,381.

Ramsden, Jesse, a mathematical instrument-maker, was born at Salterhebble, near Halifax, in 1735, and began life as a cloth-worker. About 1755 he moved to London, where his skill as an engraver recommended him to the instrument-makers. Being of an inventive turn, he spent his best efforts in improving the sextant, theodolite, equatorial, barometer, micrometer, mural quadrant, and the like, reducing the range of error of the sextant from 5 minutes to 30 seconds. He made the theodolite for the Ordnance Survey of England. He devised the mural circle, and made the first for Palermo and Dublin. He spent several years over an instrument for graduating mathematical instruments (see GRADUATION), and published an account of it (1777). For this the Commissioners of Longitude awarded him £615. He was elected a Fellow of the Royal Society in 1786, and was voted the Copley medal in 1795. He died at Brighton on 5th November 1800. Descriptions of some of his improved instruments will be found in *Phil. Trans.* (1779 and 1783).

Ramsey, (1) a seaport and watering-place in the north of the Isle of Man, 14 miles N.N.E. of Douglas. It stands on a spacious bay, with a good sandy beach and a background of wooded hills (1842 feet), and from the beauty of its surroundings and the salubrity of its climate has risen into a favourite resort of pleasure-seekers. It has two promenades, a park, salt-water lake, a pier 720 yards long, and steamboat communication with Liverpool, Belfast, Glasgow, Ardrossan, and Douglas. Pop. 5000.—(2) An urban district of Huntingdonshire, 12 miles N.N.E. of Huntingdon. It has remains of a mitred Benedictine abbey (969). Pop. 5000.

Ramsgate, a watering-place and seaport of Kent, in the south-east of the Isle of Thanet, 72 miles E. by S. of London, 4 S.S.E. of Margate, and 15 E.N.E. of Canterbury. From a small fishing-village it began to increase in importance during the 18th century through successful trade with 'Russia and the East country,' and through the formation (1750-95) of a harbour of refuge for the Downs. That harbour, 51 acres in extent, with a sea-entrance 250 feet wide, is enclosed on the east and west by two piers 670 and 520 yards long. The aspect of the place, which George Eliot calls 'a strip of London come out for an airing,' is familiar through Frith's 'Ramsgate Sands' (1854); among its special features are a municipal concert-hall (1914), an obelisk marking the spot where George IV. in 1821 embarked for Hanover, an iron promenade pier (1881), the fine Granville Hotel, a beautiful Roman Catholic church by the Pugins, a Benedictine monastery, college, and convent, and a Jewish synagogue and college, erected by Sir Moses Montefiore, who, like the elder Pugin, was a resident. To the north is Broadstairs (q.v.), beloved of Dickens; and to the west Pegwell Bay, with Ebbsfleet, the landing-place of St Augustine, and also, traditionally, of Hengist and Horsa. Here, too, is Osengal Hill, with an early Saxon cemetery. Ramsgate was incorporated in 1884. Pop. (1851) 11,838; (1881) 22,683; (1911) 29,603; (1921) 36,560.

Ramsons. See ALLIUM.

Ramus, Petrus, Pierre de la Ramée, an illustrious French humanist, was the son of a

poor labourer, and was born at the village of Cuth, in Vernandois, in 1515. In his twelfth year he got a situation as servant to a rich scholar at the Collège de Navarre, and, by devoting the day to his master, obtained the night for study, and made rapid progress. The method of teaching philosophy then prevalent dissatisfied him, and he was led to place a higher value on 'reason' than on 'authority'; when taking his degree in his twenty-first year he even maintained the extravagant thesis that 'all that Aristotle had said was false.' Immediately after he began lectures on the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to reform. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Dialectica Partitio*) appeared in 1543 it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by a royal edict, and his lectures for a time suspended. But Ramus had at this time two powerful friends, Cardinals Charles de Bourbon and Charles de Lorraine, through whose influence he was, in 1545, appointed principal of the Collège de Presles. In 1551 Cardinal Lorraine succeeded in instituting for him a chair of Eloquence and Philosophy at the Collège Royal. He mingled largely in the literary and scholastic disputes of the time, and ultimately embraced Protestantism. He had to flee from Paris; after 1568 he travelled in Germany and Switzerland; but on returning to France in 1571 he perished in the fatal massacre of St Bartholomew, 24th August 1572. It was believed that he was assassinated by the direct instigation of one of his most persistent enemies.

Ramus holds an honourable place in the list of intellectual reformers. His assault on scholasticism as a method of thinking is vigorous, and his exposure of its puerile and useless subtleties is thorough. His system of logic, by which his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but it really adds little to logical science. What strikes one most, however, in Ramus is his universal intellectual activity. He wrote treatises on arithmetic, geometry, and algebra which were text-books for a hundred years; he was among the earliest adherents of the Copernican system of astronomy; Latin, Greek, and French grammar, rhetoric, morals, and theology all engaged his pen, and he seldom handled a subject which he did not to some degree elucidate. His followers were a widespread, and for long a powerful, body of thinkers and teachers: France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain had their *Ramists*.

See monographs by Waddington (Paris, 1855), Desmazes (1864), and Lobstein (Strassb. 1878).

Rana. See FROG.

Ranée, ARMAND DE (1626-1700), the founder of the Trappists (q.v.).

Ranching, the business of cattle-breeding as formerly pursued in the unsettled districts of the United States from the Mississippi to the Pacific coasts, and from the Bad Lands of the Upper Missouri to the Gulf of Mexico. The name is derived from the Spanish *ranchero*, properly 'mess' or 'mess-room,' but used in Mexico also for a herdsman's hut, and finally for a grazing-farm, as distinguished from an *hacienda*, a plantation or cultivated farm. The cattle were raised and kept in a half-wild condition, with little or no house shelter and no artificial feeding. The life of the

'cowboys' and ranchmen was free, open, and exciting enough to have great charms for enterprising youths.

Large fortunes were made in the wild old days, but the gradual settlement of the ranching country seriously embarrassed the business of the ranchman. The old cattle-kings of the south often had ranges, under Spanish land grants, extending over several hundred square miles, and would brand many thousand calves each year. Herds would be 'on the trail' for from two to four months, the cattle from Texas crossing Red River, and passing through Indian Territory and southern Kansas to the railway; but the gradual settlement of the country and the extension of railways rendered these long trails impracticable and needless. The great events of the ranchman's year were the 'round-up,' when stock was taken, the cattle branded, and such full-grown cattle gathered into a herd as were suitable for market; and the departure of the herds for market or port—times of hard work and severe strain for all concerned. In the south there was but one annual round-up; on the more civilised ranges there were two round-ups in the year—one early in spring, to brand the calves and ascertain the losses during winter, another in autumn, when the steers over three years old were separated from the main herd and sent for sale. Similar methods have existed in Argentina, Uruguay, and Australia. The word ranching is loosely used in commerce for stock-farming and even fruit-farming; and 'fox ranching' is the breeding of the silver fox for its valuable fur, now an important enterprise.

Rand or **RANDT,** THE. See JOHANNESBURG.

Randall, JAMES RYDER, the author of 'Maryland, my Maryland,' was born in Baltimore, 1st January 1839, taught for a while in a Louisiana college, and then turned to journalism. Shnt out from the army by a delicate constitution, he still gave powerful aid to the southern cause by his lyrics. These include, besides 'Maryland' (1861; called forth by news of the passage of the first Massachusetts troops through the streets of Baltimore, and the consequent bloodshed), 'Stonewall Jackson,' 'There's Life in the Old Land Yet,' and others. From 1866 he edited a paper in Augusta, Georgia. He died in 1908.

Randazzo, a town of Sicily, at the northern foot of Mount Etna, with some old Norman churches, 43 miles N. of Catania by rail and 26 miles direct: pop. 17,161.

Randers, a town in Jutland, on the Randers-Fiord, 20 miles from its mouth in the Kattegat; pop. (1921) 26,495. It manufactures railway carriages and spirits, and exports butter and eggs.

Randolph, EDMUND JENNINGS, an American statesman, was born at Williamsburg, Virginia, 10th August 1753, studied at William and Mary College, and was admitted to the bar. In 1776 he helped to frame the constitution of Virginia, and became the state's first attorney-general. In 1786-88 he was governor of Virginia, and in 1787 he was a member of the convention which framed the constitution of the United States. He was working hard at a codification of the state-laws of Virginia when, in 1789, he was appointed by Washington attorney-general of the United States. In 1794 he was made secretary of state, but after the president's signing of the Jay Treaty (1795) with England he resigned in order to be free to vindicate his own conduct. Meanwhile he was practically ruined by the responsibility which he had incurred, as part of the duties of his office, for certain funds provided for foreign service; and, though he returned to the bar, he had to assign his lands and slaves. He died 13th September 1813. See Moncreur D. Conway, *Omitted Chapters of History*,

disclosed in the Life and Papers of Edmund Randolph (1888).

Randolph, JOHN, 'of Roanoke,' was born at Cawsons, in Virginia, June 2, 1773. He was a second cousin of Edmund Randolph, and boasted the Indian princess Pocahontas among his ancestors. In 1799 he was elected to congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity, and for thirty years was more talked and written about than any American politician. Tall and meagre, peculiar in dress and manners, he was described as a strange mixture of the aristocrat and the Jacobin. He was the Democratic leader of the House of Representatives, but quarrelled with Jefferson, and opposed the war of 1812; he opposed also the Missouri Compromise, and stigmatised its northern supporters as 'Doughfaces'; and he sided against Jackson on the nullification question. From 1825 to 1827 he sat in the senate, and in 1830 he was appointed minister to Russia. By his will he manumitted his numerous slaves, and provided for their settlement in a free colony. He died in Philadelphia, June 24, 1833. See *Lives by Garland* (2 vols. 1850), *Henry Adams* (1882), *W. C. Bruce* (1923).

Randolph, SIR THOMAS. See MORAY (EARL OF).

Randolph, SIR THOMAS, a trusted agent of Queen Elizabeth, was born in 1523, lived abroad for safety's sake during Mary's reign, and after Elizabeth's accession was frequently employed in diplomatic missions to France, to Russia, and especially to Scotland. He was first sent thither in 1559, and at many a critical juncture for more than twenty years thereafter he played his mistress's cards in the perplexed and corrupt game of Scottish politics. He was twice shot at, in 1566 was ordered by Mary to leave the court, and in 1581 had to flee from Scotland for his life. He died in 1590.

Randolph, THOMAS, poet and dramatist, belonged to a good Sussex family, but was born at his maternal grandfather's house in Northamptonshire in 1605. He was educated at Westminster and Trinity College, Cambridge, and died in March 1635. He left a number of poems and several plays: *Aristippus, or the Jovial Philosopher; The Conceited Peddler; The Jealous Lovers; The Muses' Looking-glass; Amyntas*. See *W. C. Hazlitt's* edition of his works (1875).

Ranelagh, a building erected in 1742 on the gardens of the last Earl of Ranelagh at Chelsea, had a rotunda 150 feet in diameter, with an orchestra in the centre and tiers of boxes all round. The chief amusement, promenading round and round the area below and taking refreshments in the boxes, the orchestra performing meanwhile, is often alluded to by Smollett, Johnson, and Walpole. Its older rival, Vauxhall (q.v.), survived it, for it was closed in 1803, and built upon the next year. Its site is now part of the Chelsea Hospital garden.—The name of RANELAGH, North and South, is given to two southern suburbs of Dublin.

Range-finders are used for finding the range or distance of an enemy in the field. If a measured base-line be used at right angles to the direction of an object, the distance of the object can be expressed as a function of that base-line and an angle. It is sufficient, therefore, to have an instrument capable of measuring an angle, with a scale from which the observer reads off not the actual value of the angle, but the corresponding value of the function in question, that is, the distance of the object. For harbour-defence purposes it is convenient to use an instrument for observing the

angle of depression of the object, which is equal to the angle subtended at the object by the height of the instrument above sea-level. The instrument is adjusted to that height. Instruments used at sea have a long tube, with a side-window near each end. By means of mirrors, lenses, and prisms two half-images are transmitted to the right eye of the observer looking into the middle of the tube. The rays from one end are deflected by a movable prism until coincidence is obtained, and the corresponding distance read off on a scale read by the left eye. A range-finder of the same general character, capable of solving triangles not only in the horizontal, but in vertical and other planes, is used by the British army. Others apply the principle of the sextant in quite a simple manner, but, requiring two observers working some distance apart, they are less useful in warfare than one-man instruments. See CANNON.

Rangoon, the capital of Burma and residence of the governor, stands on the Hlaing or Rangoon River, about 20 miles from its entrance into the Gulf of Martaban. The existing city is almost entirely of modern construction, built since the British took possession of the place in 1862. The town extends along the left bank of the Hlaing, the docks being on the other side of the river. Behind the town is the large military cantonment, grouped round the fortified hill (166 feet) on which stands the Shway-Dagon pagoda, 'the most venerated object of worship in all the Indo-Chinese countries.' It is built of brick, is lavishly gilded, and tapers up to a cone 321 feet above the ground (see illustration under BURMA). There is an excellent water-supply, and there has been an elective municipality since 1883. The principal buildings are the public and governmental offices, the High Court, the Anglican cathedral (begun 1886) and other European churches, the pagodas, a lunatic asylum, the chief gaol of Lower Burma, the Phayre Museum in the horticultural gardens, St John's College, the high school, a hospital, &c. The university was founded in 1920, and a site on the outskirts by the Victoria Lakes has been chosen for its colleges, halls of residence, &c. Along the river side are numerous rice-husking-mills and sawmills. Pop. (1852) 25,000; (1872) 89,897; (1881) 134,176; (1891) 181,210; (1901) 234,885; (1921) 341,962—natives of India being nearly as numerous as the Burmese. Rangoon is the principal port in all Burma, by far the greater part of the total trade passing in and out at this port. Its trade has grown at a wonderfully rapid rate since the British took possession of Lower Burma. (See BURMA.) Rangoon ranks as fourth of the commercial cities of the Indian Empire. A town has existed on the site of Rangoon since the 6th century B.C. It was always called Dagon down to the capture of the place by the Burmese sovereign Alompra towards the end of the 18th century. That prince rebuilt the place and called it Rangoon. It was taken by the British in 1825 and held until 1827; they captured it again in 1852, and have kept possession of it ever since.

Rangpur, a town of Bengal, on the Ghaghat, an arm of the Brahmaputra, 110 miles S.E. of Darjiling. It is the capital of a district in a great well-watered, fertile, well-tilled plain of sandy loam. Pop. 19,000.

Ranjit Singh, the founder of the Sikh kingdom in the Punjab of India, was born at Gujranwala on 2d November 1780, the son of a Sikh chief. His father died when he was twelve and his mother when he was seventeen years old. He at once began to show his ambition and capability for rule, and after the shah of Afghanistan had given him the

province of Lahore he directed all his energies to the founding of a kingdom which should unite all the Sikh provinces under his own personal rule (see *Sikhs*). He died on 27th June 1839. He procured from an Afghan prince, as the price of his assistance in war, the famous Koh-i-nur diamond (see *DIAMOND*). See Griffin, *Ranjit Singh* (1892), Cunningham, *History of the Sikhs* (rev. ed. 1919).

Rank in the military forces of the British empire is not confined to the commissioned classes; the various grades of non-commissioned officers, and even the titles gunner, driver, sapper, or private are officially styled ranks. *Lance* or *acting* rank is a temporary advancement. Thus, a private or sapper is first made a lance-corporal, and a gunner or driver an acting-bombardier, before being permanently promoted. Until so promoted they rank only as private soldiers. Similarly a lance-sergeant is a corporal acting as sergeant, and holds only the lower rank.

Officers of the army and royal marines may hold either regimental or army rank or both. Up to captain inclusive, rank is purely regimental. Afterwards a captain may be promoted in his regiment to the successive ranks of major and lieutenant-colonel, or while still remaining a captain in his regiment he may become a major or lieutenant-colonel in the army by Brevet (q.v.). The rank of colonel is purely an army rank, obtainable only by brevet or on receiving an appointment, such as assistant-adjutant-general, which carries that rank. The several grades of General (q.v.) are also army ranks only. *Local rank* is sometimes conferred on an officer to enable him to exercise command over others senior to him in a certain locality. *Temporary rank* is often similarly granted, and some appointments carry such rank; for instance, a colonel appointed quartermaster-general in India becomes a temporary major-general while so employed, and reverts to the lower rank at the end of his five years' term of office unless promoted in the meantime. *Honorary rank* is held by some quartermasters and riding-masters, and in the field by certain civilians, such as war correspondents. *Substantive rank* is an officer's or man's rank in his own unit. *Rank* and appointment must be kept distinct. Thus lance-sergeant is an appointment, the holder being corporal in rank. *Relative rank* is held by new officers of the ordnance corps and army pay department, and by chaplains. It carries with it all precedence and advantages attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants and horses, rations of fuel and light (or allowances in their stead), detention and prize-money. It does not entitle the holder to salutes from ships or fortresses, nor to the turning-out of guards, and, of course, it does not confer any right to command, but it allows the holder to sit on courts-martial. The corresponding ranks in the army, navy, and air force are shown in the following table. Officers rank one with another according to date of commission.

Navy.	Army	Royal Air Force.
Admiral of the Fleet.	Field-marshal.	Marshal of the Royal Air Force.
Admiral.	General.	Air Chief Marshal.
Vice-admiral.	Lieut.-general.	Air-Marshal.
Rear-admiral.	Major-general.	Air Vice-Marshal
Commodore, 1st and 2d class.	Colonel Commandant and Colonel on the Staff.	Air Commodore.
Captain.	Colonel.	Group Captain.
Commander.	Lieut.-colonel.	Wing Commander.
Lieut.-commander.	Major.	Squadron Leader.
Lieutenant.	Captain.	Flight Lieutenant
Sub-lieutenant.	Lieutenant.	Flying Officer (or Observer).
Chief Gunner, Boat-swain, or Carpenter.	2d Lieutenant.	Pilot Officer.

Ranke, LEOPOLD VON, the greatest of German historians, was born on 21st December 1795, at Wiehe, about half-way between Gotha and Halle. Although he studied theology and philology at Halle and Berlin, and in 1818 began to teach at the gymnasium of Frankfort-on-Oder, his chiefest thoughts were given to the study of history, to which they were directed principally by his Luther studies and the reading of Scott's romances. The two works, *Geschichte der romanischen und germanischen Völker von 1494 bis 1535* (1824) and *Zur Kritik neuerer Geschichtsschreiber* (1824), procured him a call to Berlin as professor of History in 1825. The latter of these works, and *Analekten* to his subsequent books, expound his views of the functions of history, and the methods of the ideal historian. History is the record of facts. It should know nothing of the political party, or church politics, or subjective views of the writer. It should be based upon sound documentary evidence, critically examined and sifted. In 1827 he was sent by the Prussian government to consult the archives of Vienna, Venice, Rome, and Florence; four years he spent in this work, and returned with a mass of the most valuable historical materials, which he utilised in *Fürsten und Völker von Süd-Europa im 16. und 17. Jahrhundert* (1827) and in books on Serbia, Turkey, and Venice; and *Die römischen Päpste ihre Kirche und ihr Staat im 16. und 17. Jahrhundert* (1834-37; 9th ed. 1889), perhaps the most finished of his books, certainly one of his great masterpieces of historical writing. Then he turned his attention to central and northern Europe, and wrote in quick succession *Deutsche Geschichte im Zeitalter der Reformation* (1839-47); *Zwölf Bücher preussischer Geschichte* (1847-48; new ed. 1871-74); *Französische Geschichte* (1852-61); *Englische Geschichte* (1859-67; 4th ed. 9 vols. 1877-79), the last two treating chiefly of the same two centuries as the books on south Europe; and *Zur deutschen Geschichte, vom Religionsfrieden bis zum Dreissigjährigen Krieg* (1869). Later periods and special periods of German history are treated of in books on the Origin of the Seven Years' War (2d ed. 1874), the German Powers and the Confederation (1871), *Zur Geschichte von Oesterreich und Preussen zwischen den Friedensschlüssen zu Aachen und Hubertsburg* (1876); the history of Germany and France in the 19th century (1887), and monographs on Wallenstein (1869), Hardenberg (5 vols. 1877-78), and Frederick the Great and Frederick William IV. (1878). To the above must be added a book on the revolutionary wars of 1791 and 1792 (1875), another on Venetian History (1878), and *Die Weltgeschichte*, of whose nine volumes (1881-88) he lived to see only seven published. This last work, which is the copstone of Ranke's historical labours, was begun when he was an old man of eighty-two; yet at that great age he kept two schooled historical assistants busy, studied critically the Greek and other sources, dictated and worked eight to ten hours a day, and published one volume a year regularly, until he died, on 23d May 1886, having rested from his beloved work only a few short days. Even his long life—he was over ninety when he died—would hardly have sufficed for the thorough works he accomplished had he not been a man of unwearied industry, with a marvellous memory, and a swift and intuitive judgment as to the value of historical material. His style is not brilliant, yet sufficiently clear and interesting. He always wrote from the standpoint of one who had the whole history of the world before his mind's eye. This and his skill in the portraiture of historical personages often lend the deepest interest to his narratives. His point of view was, however, that of the statesman; and he fails to give due prominence to the

social and popular sides of national development. Rankine married an Irish lady in 1843, and was ennobled in 1865. He continued to lecture until 1872. His lectures exercised a great influence upon those who sat at his feet to learn, as is seen in the works of the great school of historical writers, Waitz, Von Sybel, Giesebrecht, and others. The 54-volume edition of his works (1881-90) does not comprise the *Weltgeschichte*, but includes the autobiographical *Zur Eigenen Lebensgeschichte*. Several of the works have been translated into English.

See monographs by Giesebrecht (1887), Guglia (1893), and Hohnolt (1907); H. Oncken, *Aus Rankes Frühzeit* (1922); and Guillard, *L'Allemagne Nouvelle* (1899).

Rankine, WILLIAM JOHN MACQUORN, was born of good Ayrshire family at Edinburgh in 1820, and had his education at the university there. He learned engineering under Sir J. Macneill, and was appointed in 1855 to the chair at Glasgow. He died 24th December 1872. Rankine was an incessant worker, and his books were quickly accepted everywhere as standard text-books of engineering; and of especial value in the region of mathematical physics were his contributions to the science of Thermodynamics, and to the theories of Elasticity and of Waves. His more important papers were collected, with a Life by Tait (1881). Another side of his nature was seen in his humorous and patriotic songs, collected as *Songs and Fables* (1874).

Rannoch, a bleak, desolate moorland of north-west Perthshire, with a mean elevation of 1000 feet above sea-level, measuring 28 miles by 15. Its surface is mostly a broad, silent, featureless tract of bog, heath, and moss, girdled by dark, distant mountains. In its western part is Loch Lydoch (5½ miles by ½ mile; 924 feet above sea-level), which winds amid flat and dismal scenery. Stretching eastward from the moor is Loch Rannoch (9½ miles by 1½ mile; 668 feet), which is overhung by Schiehallion, contains a crumog with a later fortress, and sends off the Tummel 29 miles eastward and south-south-eastward to the Tay. Loch Tummel (2½ miles by ½ mile; 130 feet) is an expansion of this river, on which are also the Falls of Tummel, 20 feet high.

Ransom—from Latin *redemptio*—was the price paid by a prisoner of war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors, but those for princes or great nobles to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I. for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and King John of France for £500,000, payable in instalments. In the war between France and Philip II. of Spain, the Duc de Longueville paid Count Horn 80,000 crowns as his ransom. Ransoms were superseded by exchange of prisoners.

Ranters, a fanatical antinomian sect, charged

with pantheism and unholy practices, which arose in England about 1645, and died out with the century. Quakerism helped to supersede rantism. The name was also given to the Primitive Methodists.

Ranunculaceæ, a family of dicotyledons, mostly herbaceous, rarely shrubs, and generally natives of cold, damp climates. *Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species exceeds 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated sheathing stalks. The calyx is of 3-6 deciduous hypogynous sepals; the corolla of 3-15 hypogynous petals, in one or more rows, sometimes assuming very remarkable forms, as in larkspur, aconite, and columbine; rarely absent, in which case the sepals are gaily coloured. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil; the ovary with one or more ovules. The fruit either consists of dry achenia, or is berry-like or follicular. Acridity is the prevailing character of the order, and the leaves of some species readily produce blisters; but this property disappears when they are dried or heated. Many are narcotic and poisonous; some are used in medicine, as aconite and hellebore. The seeds of *Nigella arvensis* were formerly used instead of pepper. The May Apple or Wild Lemon (*Podophyllum peltatum*) of North America is usually placed in Berberidaceæ (see *PODOPHYLLUM*). Many of the order produce flowers of great beauty, as some species of *Ranunculus* (q.v.), *Anemone* (q.v.), *Larkspur* (q.v.), *Peony* (q.v.), *Columbine* (q.v.), *Clematis* (q.v.), &c.

Ranunculus, a genus of plants of the family Ranunculaceæ; having five sepals; five petals, with a nectariferous pore at the base of each petal, often covered with a scale; many stamens situated on a receptacle, and ovaries accumulated into a head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers, familiarly known as *Buttercups*; others, known by the name

Ranunculus acris, garden varieties.

of *Crowfoot*, are troublesome weeds in gardens and pastures. Many, as the Spearworts, are found chiefly in moist places, and some are altogether aquatic, covering the surface of ditches, ponds, and rivers, where the water is shallow, with a carpet of verdure exquisitely studded with beautiful white flowers. One species, the Asiatic *Ranunculus*, or Garden *Ranunculus*, exclusively the *ranunculus* of florists, a native of the Levant, has

been grown in Europe for 300 years. The cultivated varieties are extremely numerous, brilliantly coloured, and very symmetrical in form. The ranunculus is propagated by seed, by offset tubers, or by dividing the clusters of tubers. The roots are often taken up in summer, after the leaves die, and kept in a dry place till the beginning of the ensuing winter or spring. The ranunculus loves a free and rich soil. Double-flowered varieties of some other species, with taller stems and smaller white or yellow flowers, are cultivated in flower-gardens, sometimes under the name of *Bachelors' Buttons*. The acidity of many species of ranunculus is such that the leaves, bruised and applied to the skin, produce blisters; and those of *R. sceleratus*, a pretty common British species, are said to be used by beggars to cause sores in order to move compassion. *R. Thora*, an Alpine species, is of extreme acidity, and hunters were accustomed in former times to poison darts and arrows with its juice. Water distilled from the leaves of *R. Flammula*, a British species, with rather tall stem and ovate-lanceolate leaves, common by the sides of ditches, &c., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning. Yet the leaves of *R. Ficaria*—sometimes called *Pilewort* and *Lesser Celandine*, a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pasture in which *R. acris*, *R. repens*, &c., are very abundant are injured by them; these plants are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage is even advantageous, and that they may act as a condiment. Their acidity is lost in drying, and they are not injurious to hay. The small tubers of *Pilewort* were once used for the cure of hamothroids (see SIGNATURES). *R. aquatilis*, by many divided into a multitude of species distinguishable only by an expert, is very abundant in streams in many parts of Britain. Its submerged leaves are often finely divided, its floating leaves lobed. It is eaten with avidity by cattle, the acidity so general in the other species being wanting in it.

Ranz des Vaches (in German, *Kuhrgigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture on the Alphorn or Kuh-horn (q.v.) The associations of pastoral life recalled by these airs to the Swiss in foreign countries have been said to produce an almost irresistible longing for home.

Rap (contracted from *rapparee*, 'an Irish plunderer'), familiar in the phrase 'not a rap,' was a counterfeit Irish coin of the time of George I., which passed for a halfpenny, though not really worth a fourth of that value. The Swiss centime is called a *rappen*.

Rapallo, a winter health resort of Northern Italy, 17 miles by rail ESE. of Genoa, with a castle and the pilgrimage church of the Madonna (1557) on the Monte Allegro. Off here the Venetian Fleet defeated the Genoese in 1431. Pop. 14,000.—By the treaty of Rapallo (1920) Yugoslavia agreed that Italy should have Cherso, Lussino, Unie, and Lagosta, and the town of Zara; Fiume to be independent.

Rapateaceae, a family of monocotyledons with some affinity to Bromeliaceae and Ericaceae, amphibious marsh plants inhabiting the country between the Orinoco and the Rio Negro. *Rapatea pulidosa*, with leaves nearly two yards long, may be considered the type.

Rape, or COLESEED (*Brassica Napus*; see BRASSICA), an annual plant much cultivated on account both of its herbage and of its oil-producing seeds. It is a native of Europe and perhaps of England; but it is hard to say where it is truly indigenous and where naturalised. It is so nearly allied to *Brassica Rapa* (Turnip), *B. campestris* (Swedish Turnip, Colza, &c.), and *B. oleracea* (Kale, Cabbage, &c.), that botanical distinction is difficult, particularly for some of the cultivated varieties. The root of rape is slender, or in cultivation sometimes becomes carrot-shaped (see NAVEW), but it never becomes turnip-shaped. The cultivation of rape is very general in many parts of the continent of Europe, from which it seems to have been introduced into England at least as early as the 16th century; and in the 17th century, if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the Continent it is not unusual to sow rape for *green-manuring*—i.e. its herbage is ploughed into the soil, a mode of enriching land much more common in some parts of Europe than it is in Britain. Rape-oil is used for machinery, for lamps, and, especially in the East Indies, for human consumption; but the oil and cake so called are not exclusively obtained from this plant, nor are the names *Colza-oil* and *Rape-oil* used to discriminate the produce of different plants, although in some parts of Europe the name *Colza* is given to varieties of *Brassica campestris* and *B. oleracea*, which are cultivated in the same way as rape. *B. praecox* is also cultivated in some places, being sown in spring and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names (see OILS, OIL-CAKE).—The name *Rape* is from Lat. *rapa*, 'a turnip'; *Colza* is through the French from the Dutch *koolzaad*, 'cole-seed.'

Rape (*Brassica Napus*):
a, silique

Rape is having carnal knowledge of a woman without her conscious consent, and such consent must not be extorted by violence or threats of violence. The Criminal Law Amendment Act, 1885, provides that a man is guilty of rape if by personating a woman's husband he succeeds in having connection with her. Previously the point was doubtful. A husband cannot under any circumstances commit rape on his own wife, her consent at marriage being irrevocable; but Mr Justice Stephen was of opinion that under certain circumstances he may be convicted at least of an indecent assault. Nor, in England, can a boy under fourteen be guilty of this crime, for in law (whatever be the physical fact) he is absolutely presumed incapable; but both husband and boy may be charged with assisting others in committing it. Rape is a felony punishable with penal servitude for life. To this every one who unlawfully and carnally knows any girl under the age of thirteen years is also liable. The attempt to have unlawful carnal knowledge of any girl under

thirteen years of age is a misdemeanour punishable by two years' imprisonment with hard labour. The act or attempt to have unlawful carnal knowledge in the case of a girl between thirteen and sixteen, or in the case of any female idiot under circumstances which do not amount to rape, are also misdemeanours, punishable in the same way. The Criminal Law Amendment Act, 1922, no longer makes a reasonable belief on the part of the accused that the girl was under sixteen a defence to the charge, except where the accused is under twenty-three on the first occasion of the charge. The merest penetration suffices to constitute the crime. As regards evidence in cases of this sort, the most important question will usually be, How far is the supposed injured person to be believed? That depends on many things, of which the chief are (1) her character—for though as a matter of law rape may be committed on a prostitute, since even she cannot be compelled to submit to outrage, yet in fact if the chief witness is shown to be unchaste the charge almost invariably breaks down; (2) the time within which and the person to whom she made the first complaint; (3) any marks of violence on her dress or person, and her agitated or calm demeanour; (4) the scene of the alleged crime, and the probability of strenuous resistance attracting public notice; (5) whether the prisoner fled or not; (6) any marks of violence on his dress or person. (7) If apprehended soon after the alleged act the accused is usually asked to submit to medical examination. Refusal to do so is a strong presumption of at least intercourse. The thing to be guarded against is either a false charge made by a woman to extort money or, on failure of this attempt, persisted in from spiteful motives, or an accusation made by one who after consenting resists too late, or who tries when by any accident the fact of connection becomes known to whitewash her character.

The law which protects women against the class of crime of which rape is the chief has been made much wider of late years, chiefly by the Criminal Law Amendment Act of 1885, which contains provision against various kinds of procreation. As regards the abduction (1) of a woman on account of her fortune; (2) by force with intent to marry; (3) of an unmarried girl under the age of eighteen with intent to have carnal knowledge of her, it need only be remarked that the first two are felonies punishable by fourteen years' penal servitude, and the third a misdemeanour punishable by two years' imprisonment with hard labour.

In the United States the crime is everywhere treated as a felony, and punished with imprisonment for life or for a number of years; but the punishment is somewhat different in the different states of the Union. See also ABDUCTION.

Rape, a territorial division peculiar to the county of Sussex. There are six of them—viz. Hastings, Pevensey, Lewes, Bramber, Arundel, and Chichester.

Raphael Santi, born at Urbino in 1483, died at Rome 1520, was the son and pupil of Giovanni Santi, a painter, whose death took place in 1494. Apprenticed about 1499 at Perugia, Raphael learned his profession from Perugino, and became such a clever imitator of his style that to this day the early pictures of the disciple are confounded with those of his teacher. Raphael, in fact, copied Perugino's drawings (Academy of Venice), helped to work at Perugino's pictures, and finished altarpieces from Perugino's designs. Examples are the Resurrection of the Vatican and the Virgin and Child, with and without attendant saints, at Berlin. The presence of Raphael during these years at Perugia, Urbino, and Città di Castello may be traced by his sketches at each of these

places. His first patrons were the Duke and princesses of Urbino, ecclesiastical corporations at Città di Castello, and ladies of the high families of Baglione and Oddi at Perugia. His earliest commissions were those of Città di Castello, where (1502-3) the most important of his early works, the Crucifixion in the National Gallery, was painted. An Assumption of the Virgin, now at the Vatican, was executed shortly after for Maddalena degli Oddi. Distinct features in these pieces are dependence as to form on Perugino and Pinturicchio, combined with a feeling for grace and pure colour essentially original. In a Marriage of the Virgin of 1504 (Milan gallery), these qualities are found in conjunction with exact repetitions of Perugino's figures. It is probable that about 1504 Raphael began to discern the advantage of greater independence. His predellas of the Vatican Coronation, and especially the Epiphany of that series, already display some acquaintance with the more advanced methods of the Florentines. Yet for some time longer the paramount influence of Perugino remained manifest, and Raphael showed Peruginian influence in such pictures as the Conestabile Madonna, now at St Petersburg, the Vision of the Knight in the National Gallery, the little St Michael and St George, or the Marys of the Louvre, and the Graces at Chantilly. The painting of the Graces is obviously connected with a journey which Raphael made to Siena in 1505, when he gave assistance to Pinturicchio in drafting the preliminary design for frescoes in the Piccolomini library. It was there that he copied the Graces, of which the sketch, sometimes, however, attributed to Pinturicchio, is preserved at the Venice Academy. At Siena Raphael probably heard that Leonardo and Michelangelo were rivals for the decoration of the town-hall of Florence, and there is good cause for thinking that he accompanied Perugino to that capital to be near the lists of this artistic tournament. But before starting he probably took commissions, which gave as a final result the Virgin, Child, and Saints, in full length, called the Madonna Ansidei, now at the National Gallery, and the Virgin and Child with four saints, called the Madonna of Sant' Antonio, in the Morgan collection, both of which were delivered at Perugia. The Madonna of Terranova, a group of half-lengths at the Berlin Museum, was completed at Florence. Raphael was now on the path which Perugino had trod before him, had a painting room at Florence and a painting-room at Perugia, but was not satisfied as his master had been with that finality which caused Perugino to remain stationary in the rut of an old style. He determined to acquire and assimilate some of the boldness of Michelangelo, and the principles which Leonardo had been teaching to the students of his academy at Milan. When, after a short absence at Florence, he resumed work on the Ansidei and Sant' Antonio Madonnas at Perugia, Raphael gave as much as he could of the new spirit which was in him to those compositions, without being able to alter their archaic character. In the second of these pictures some heads, recast in a new mould, reveal the influence of Da Vinci; for it is characteristic of Raphael that, after witnessing the struggle of that master with Michelangelo, he came for a time to the conclusion that Leonardo was the better man so far as grace and expression were in question, though for action the spirit of Michelangelo might be preferable. The Terranova Madonna shows the struggle in which Raphael was engaged. It has the brightness and sweetness of the Umbrian with the breadth of execution of the Florentine. But similar characteristics distinguish the five small predellas which once formed part of the

Madonna of Sant' Antonio, whilst the 'Sermon on the Mount,' in Lord Lansdowne's collection at Bowood, and part of the predella of the Ansdei Madonna, display the influence of the works of Masaccio, Filippino, and Ghirlandajo.

It is not historically proved that Raphael and Da Vinci were intimate, but all the pictures which left Raphael's easel at Florence in 1505-6 recall Leonardo in expression, concentration of lines and light, tempered atmosphere, and subtle combinations of movement and tints. Examples are *Madonnas and Holy Families*, of which the most conspicuous are that of the *Gran Duca* at Florence, the small *Cowper*, the *Cardellino*, and *Casa Tempi*, and the *Virgin in Green* at Vienna. But in portrait more than elsewhere the lessons of Da Vinci are visible, and the likeness of *Maddelena Doni* at Florence is inspired by the *Mona Lisa* of the Louvre. Of special interest to Englishmen as a creation of this time is the *St George*, which was sent by the Duke of Urbino to Henry VII. of England in return for the garter given by that prince to *Guidobaldo* of Montefeltro. Attractions in other ways are the painter's own likeness at the *Uffizi*, in which we discern that the grace of his art was also displayed in Raphael's person, the *Madonnas of Orleans*, of the *Palm*, of *St Petersburg*, and *Canigiani*, in which Raphael finally appears as a pure Tuscan familiar with the arts of all his Florentine contemporaries.

The Entombment to which Raphael now turned his attention was finished for *Atalanta Baglioni*, and recalls in many ways the misfortunes which attended the worthless family of that name, which had so long governed Perugia. The sketches for the picture contain incidents that remind us of a massacre in which *Atalanta* lost her son. The picture in the *Borghese* palace is an embodiment of all the new principles which Raphael acquired at Florence, realising the perfect drawing of Da Vinci and the sculptural shape of Michelangelo, allied to Peruginian softness, and colour such as only Raphael could give. The result is perhaps a little stiffness, which is happily avoided in a graceful predella representing *Hope*, *Faith*, and *Charity*. As this fine work advanced to completion Raphael became very evidently attracted by the style of Fra Bartolommeo; and, under the influence of that master of monumental painting, he brought in part to perfection the *Apostles* attendant on the *Eternal*, in a fresco at *San Severo* of Perugia, whilst he composed and finished the *Madonna del Baldacchino* at Florence. During the progress of these works Raphael got into a large practice at Florence, where he reigned supreme in the absence of Perugino, Leonardo, and Michelangelo. Some of the best work of his Florentine period was now produced—the small *Holy Family* with the *Lamb* at Madrid, much in the spirit of Da Vinci; the *St Catharine* of the Louvre; the *Bridgewater* and *Colonna Madonnas*; the *Virgin and Sleeping Infant* of Milan; the large *Cowper Madonna*; the *Bella Giardiniera*, and the *Esterhazy Madonna*.

From the days of Giotto and Masaccio to those of Raphael Rome had always attracted to its centre painters and sculptors of acknowledged skill in other cities of Italy. Michelangelo had left Florence for the Vatican, and Raphael in 1508 did the same at the instigation of his friend Bramante, who was in great favour with Julius II., and not without support from Michelangelo. The plans of this pope were gigantic. He laid the foundation of the new cathedral of St Peter because old St Peter's was tottering to its fall, and he caused the papal chambers to be decorated afresh because he disliked the frescoes of the old masters at that time covering their walls. He employed

Raphael because Perugino, Sodoma, and others had failed to satisfy his taste. The date of Raphael's engagement to paint the 'Camere' of the Vatican is now fixed with certainty as 1509. In the ceiling of the chamber 'of the Signature' the space is divided into fields, in which the *Temptation*, the *Judgment of Solomon*, the *Creation of the Planets*, and *Marsyas* and *Apollo* were inserted side by side with medallions enclosing allegories of *Theology*, *Philosophy*, *Justice*, and *Poetry*. All these pictures exhibit an expanded style, in which the spirit of Perugino, quickened by the subtler spirit of Leonardo and Fra Bartolommeo, becomes associated with the antique. Never before had the artist had such an opportunity of study as now. When at Rome he was enabled to visit the treasures of old sculpture and gems at the Vatican, and the collections of the cardinals Rovere and Medici. On the walls of the camera Raphael began the *Disputa*, in which he represented the *Eternal*, *Christ*, *Mary*, and the *apostles* and *angels* presiding in heaven over the sages of the Trinitarian controversy. Here Raphael practically entered on a method of painting with which he had not been very familiar; but he gained confidence as he proceeded, and, gradually descending from the higher parts to the lower, he equally applied the models and precepts of Leonardo and Fra Bartolommeo, became bolder and more energetic in the conception and rendering of form, and nearly succeeded in equalling the power of Michelangelo himself. It was a happy time during which the youthful master laboured at this composition, the time when he longed to add to the art which he knew so well that of poetry, in which Michelangelo excelled. His sketches for the *Disputa* are filled with snatches of sonnets, which, as he soon saw, were entirely beneath the mark. But if his friends should reject his verses, they could praise his picture, which is indeed the noblest work that had then been completed at Rome. The *School of Athens* immediately followed the *Disputa*, taking Raphael into the pre-Christian period of Plato and Aristotle. The picture embodied old philosophy and sciences. It was laid out in a temple planned for Raphael by Bramante, in which the philosophers met, appropriately clad in the dress of the ancient Greeks, surrounded by statues and bas-reliefs, which all gave occasion to the painter to transport his spectators into an almost forgotten realm. The manner in which he reproduced antique character and costume, in action, movement, and expression, is acknowledged to have been worthy of the man who succeeded in displaying with a single effort the progress made by Italian painters from the days of Giotto to those of Ghirlandajo. The *Parnassus* which came after the *School of Athens* takes us back to the age of Greek verse, showing us *Apollo* and the *Muses* attended by the poets from Homer to Ovid, and escorted by Dante. Raphael admirably transformed the antique into something living and present to the moderns, infusing into groups and figures the life of a scenic actuality. The allegory of *Prudence*, which came next, is less natural than the *Parnassus*, but rescued from affectedness by grace of lines and skill in pictorial treatment. The subordinate pictures of the Pope accepting the *Decretals*, *Justinian* receiving the *Pandects*, and *Augustus* saving the manuscripts of *Virgil* are worthy adjuncts to the principal themes. Julius II. asked Raphael to introduce his portrait into the *Decretals*, and the likeness of the pontiff with a beard enables us to fix the date of the completion of the Chamber of the Signature in the middle of August 1511. On the same day that Julius II. was privileged to witness the completion of Raphael's first cycle of wall-paintings he officiated

at mass in the Sixtine Chapel, where the first half of Michelangelo's ceiling was uncovered.

During the progress of the works in which he employed and formed the talents of his disciples—Giovanni da Udine, Penni, and Giulio Romano—Raphael divided his time between the labours of the Vatican and easel-pictures. The portraits of Julius II. and the Virgin of the Popolo, of which copies have come down to us, were executed; drawings were furnished to the copper-plate engraver Marcantonio for the Massacre of the Innocents; and Madonnas and Holy Families were composed, of which it is only possible here to give the names—Madonnas of Alba at St Petersburg, of Garvagh at the National Gallery, of the Diadem at the Louvre. Nothing could exceed the impatience of Julius to get the chambers of the Vatican properly decorated. He urged Raphael not in vain to begin the chamber of Heliodorus, and in a comparatively short time the master produced, with clever help from his disciples, the ceiling, in which the Eternal appears to Noah, Abraham's Sacrifice, Jacob's Dream, and the Burning Bush. In all these compositions Raphael's mastery is great, and his figures of the Eternal are majestic. The Expulsion of Heliodorus and the Mass of Bolsena are planned so that by a pictorial license the pontiff is present as the scenes are enacted. The death of Julius early in 1513 but slightly interrupted the labours of the painter, who gave a noble rendering of Leo X. and his suite in the picture of the Defeat of Attila. The Deliverance of Peter, which closed the decorations, was an effective piece of composition, in which Raphael for once indulged in contrasts of torch and moonlight and glare balanced by powerful gloom. The constant employment of disciples enabled Raphael, in the three years which elapsed between the completion of the two chambers—i.e. between 1511 and 1514—to finish the Madonna di Foligno at Rome, the Isaiah of St Agostino at Rome, the Galatea of the Farnesina, and the Sibyls of the Pace, not to speak of the mosaics of the Popolo ordered by Agostino Chigi. In many of these works Raphael's style is equal to that of Michelangelo at the Sixtine, with the additional charm of a grace which was his own. He also laid the antique under contribution with great skill and success, and his art was that of a master who works without hesitation because ready for every form of effort that can be required of him. In a graver mood he also painted at this time the severe Madonna of the Fish at Madrid, in a playfully sweet mood the Madonna della Sedia at Florence; whilst in portraits such as Altoviti at Munich, and Inghirami at Florence, he rises to the perfect rendering of features and expression which finds its greatest triumph in the Leo X. of Florence.
